What should she give them? Flowers! She caught up an armful from her throne and tossed the blossoms among them. How they laughed and clapped their hands! The more she threw, the more there were to throw, for all the good fairies of the woodland were there, though unseen in the light of the sun. Then the children, taught by the Princess, made wreaths and garlands and when they were finished she led them from tree to tree, and they hung the wreaths and garlands upon them, saving the most beauteous of all for

### MORNING EXERCISE IN LOMALAND

the great Pine-tree. The remaining flowers they gathered in their arms, and the Princess led them down the little path to the river and they placed the blossoms on its bosom, "Bear them to all the children of the world," they exclaimed joyously.

When the village clock struck seven, slowly, sadly, silently, the children disappeared. The Princess stood alone upon the throne, not less sad than they.

"Why art thou sad, little Princess?" asked a low deep voice. The Princess looked up, for the voice seemed to come from the Pine-tree; but the tree had vanished! There stood, in its stead, a tall form whose kindly face beamed down upon her from his great height, and as he spoke all the changeful music of the Pine-tree sounded in his beautiful voice. "These many years, little Princess," he continued, "I have watched over and guarded thee, and I have noted that thy heart is full of love for thine own kind and all creatures. The magic moment has now come when I may stand revealed before thee. What dost thou wish that I may grant?"

"I wish to be the queen of a kingdom of children, so that they may be as happy as the birds and flowers of the woodland," said the Princess bravely.

"That is a difficult wish to fulfil," declared the stately visitor, "it can only be accomplished by one who has the Invincible Sword, the Golden Key, and the Magic Jewel that were won by the dauntless maiden Warrior who climbed to the Morning Star. Prove that you are worthy and they will be given to you in due time. Only the dauntless heart can win them. Without their magic you cannot enter your kingdom. Now take this pebble," and he placed in her hand a brown stone about the color and size of a hazel nut, "it was dropped by a Wanderer who last evening rested on the spot where you now stand. Just before sunset cast it into the river and without looking back, return here."

"I will obey," declared the Princess, placing her right hand upon the golden star on her breast. At that moment, all the birds of her woodland kingdom began singing joyously, and a lovely white wood-pigeon hovered above her head and uttered a long soft love-note. She answered with a gentle cooing sound, and the dove fluttered down into her outstretched arms and nestled its head on her heart, while she stroked its pretty wings. When she looked up she was alone. Again the Pine-tree spread its protecting boughs above her.

As the shadows of the laurels in the garden lengthened, the little girl again ran down to the river. She cast the pebble far out into its waters. It fell with a soft gurgling sound just as the sun sank below the horizon. Without once looking back she sped, lightly as a bird, to the Pine-tree. Then she turned to look out over the river. Through the trees she could see a long line of whiteness, and she knew it was the evening mist clinging to the river. Slowly the mist arose, a silvery curtain, and the blue distance looked like the sea. Low on the horizon the clouds hung dull-colored and heavy, and they looked like the land rising out of the sea. But above they piled themselves up in billowy white masses, the summits glowing with pink and purple light, until they looked like palaces and temples with jeweled domes and towers. A mocking-bird in the Pine-tree sang out gaily. It sounded like a call, and from every direction the little Princess of the Woodland beheld children, marching, marching, toward the sparkling towers and domes.

"My kingdom!" she cried in ecstasy, her face aglow with rosy light, her arms stretched out toward the golden west. Then she sang! Up, up, sprang the magic tones. Fairies caught them in their crystal chalices and away they flew, scattering them over the world like dew. And every child that entered the Princess' kingdom, came bearing one of those magic notes in his heart! STUDENT

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogenesis

Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

## Volcanoes Earthquakes and the Sun

FOR the past few decades science has been approaching — with hesitating steps certainly and as if there were some peril threatening the materialistic position — one of the fundamental principles of Theosophy, *i. e.*, the domination of the law of Cycles in human life and in nature as a whole. Not only in human and animal physiological functions are new discoveries being made, but at last the general principle enshrined in the wise proverb "History repeats itself" is re-asserting itself in other directions.

To the student of Theosophy the value of the recognition of the cyclic return of events and conditions is greatest when it explains the ups and downs of human and national life, for it is of personal importance to each of us to know his best opportunities and also the occasions of mental and physical depression against which to take precautions. From the testimony of antiquity it would seem that the ancients were more sensitive to the recurrence of the cycles than we moderns, for they took

**A Knowledge  
not Limited  
by Physical  
Machinery**

great pains to counteract evil influences and to reinforce good ones by elaborate preparations founded on a knowledge of certain principles in man and nature, now unknown, or disregarded by the world in general.

But the cyclic impressions must be as potent as ever, and it would be a curious study to unravel why the most materially progressive races have almost ceased to recognize them. For it is a fact that outside the purely formal ceremonies of the churches — for keeping which at those particular times the ecclesiastics advance no good reasons except that the events commemorated happened to take place at the corresponding periods — the world of culture only recognizes our annual celebrations as arrangements adopted by practical people for general convenience. In fact, new holidays, like the English Bank Holidays, are even created without regard to anything but material needs. We have ceased to work with nature in more ways than this, owing to ignorance and selfishness, and we have to suffer the penalties. And yet, in the words of H. P. Blavatsky:

**Riddles We  
Will not  
Solve**

We stand bewildered before the mystery of our own making, and the riddles of life that we will not solve, and then accuse the great Sphinx of devouring us. (*The Secret Doctrine*)

And again:

The revolution of the physical world, according

to the ancient doctrine, is attended by a like revolution in the world of intellect — the spiritual evolution of the world proceeding in cycles, like the physical one. Thus we see in history a regular alternation of ebb and flow in the tide of human progress. The great kingdoms and empires of the world, after reaching the culmination of their greatness, descend again, in accordance with the same law by which they ascended; till having reached the lowest point, humanity reasserts itself and mounts up once more, the height of its attainment being, by this law of ascending progression by cycles, somewhat higher than the point from which it had before descended. (*Isis Unveiled*)

As there was once accurate information upon astronomical subjects, including the roundness of the earth, which was entirely lost during the Dark Ages, so the equally apparent laws of Cycles have only begun to be recovered after a still longer time. As the official representatives of science are awakening to the fact that some at least of nature's laws are periodic, we may expect ever-increasing discoveries to this end, all of which must be of importance to us — creatures of circumstance as we are in such large measure.

**The Harmony  
of the  
Universe**

H. P. Blavatsky constantly urges the need of our recognizing the law of cyclic progression; in *The Secret Doctrine* it is mentioned as one of the fundamental principles inherent in creative manifestation, from the widest sweep of planetary building to the tiny span of an insect's life.

The dreaded phenomena of earthquakes and eruptions, have, until lately, been supposed to show evidence neither of regularity nor signs by which they could be foretold. But with the greater number of classified facts now accumulated, a rough order has gradually come into view, and it is now clearly demonstrated that there is some definite connexion between these phenomena and the eleven-year period of the beating of the solar heart as shown by the sunspots and the regular rhythmic contraction and expansion of the sun's polar and equatorial diameters.

**The Beating  
of the  
Solar Heart**

Dr. Ellsworth Huntington of Yale University has just published an exhaustive series of tables dating from 1755, including thirteen sunspot cycles and the corresponding seismic and volcanic activities. The tables which Dr. Huntington discusses at length were prepared by two highly competent observers, Messrs. Sayles of Harvard University and Jensen of the Royal Society of New South Wales, entirely independently of each other, and the harmonious results derived from the average of

the two are most remarkable and convincing.

Lockyer, Brückner, Bigelow, and others, have detected cyclic climatic changes on earth of 3, 11, 36, and 300 years which closely agree with the solar variations. The 36-year cycle in particular is well marked, during which temperature is low at one extreme and high at the other, accompanied by the natural phenomena that might be expected under the conditions. Dr. Huntingdon sums up his conclusions as follows:

**Rhythmic,  
Magnetic  
Excitation**

The resemblance between the mean sun-spot and mean seismo-volcanic curves is extraordinary. The maximum of the one occurs at the same time as the minimum of the other, and in both cases

there is a steady progress from maximum to minimum and back. If our terrestrial data of earthquakes and volcanoes were as complete as our solar data of sunspots, it is probable that the resemblance between the two curves would be still closer. . . . It seems impossible to avoid the conclusion that the marked coincidence between telluric and solar activity indicates a relation of some sort between the internal phenomena of the earth and the sun.

As to what that relation may be we have no clue as yet. The best that we can do is to speculate. It may be, perchance, that there is some cosmic source of energy as yet unknown, which pulsates through the universe causing both the earth and the sun to respond, each according to its kind. Possibly changes in the amount or in the nature of the energy emitted by the sun engender corresponding changes in the earth in some manner as yet beyond our ken.

Other observers have advanced the suggestion that the oscillation of the poles of the earth, though only amounting to thirty or forty feet, is responsible for some earthquakes. It is a cyclic

**A Living  
Macrocosm**

movement, reaching its maximum about once in seven years, and according to some

authorities there is a minor earthquake cycle of the same period. The severe earthquakes of 1906 occurred soon after the maximum of this cycle of polar movement. This suggestion has not received the convincing demonstration that has been derived by Dr. Huntingdon from the observations of the solar and terrestrial activities, but it is interesting as showing the efforts that are now being made by scientists to penetrate the veil hiding the great rhythmic pulsations of nature.

As Dr. Huntingdon truly says, the causes of these cyclic changes are yet beyond the ken of physical science; but why? Is it not for the same reason that the nature, nay the very existence, of the soul remains a mystery to the materialistic physiologist or "psychologist"? *i. e.*, that they are looked for in the wrong place, in the outer phenomena of matter instead of in the real thing behind, of which the illusion called matter is but the impermanent symbol. The knowledge of

**Science Ap-  
proaching the  
Meta-Physical**

these periodic laws brings us a little nearer to the meta-physical; makes us realize the immanence of something that

cannot be grasped in terms of physics. A clue to the action of the sun at a distance was given thirty years ago by H. P. Blavatsky when she pointed out that the sun is really a great magnet. This idea was not the matter of general acceptance when she wrote *Isis Unveiled* that it is becoming now. The varia-

tions in the compass, diurnal and otherwise; the magnetic storms aroused by the passing of sunspots (according to Maunder and others); the fluctuations of the Aurora Borealis; and perhaps the changes in the solar corona, support the statement that the sun possesses controlling magnetic energy (whatever that form of the One Life may be). A remarkable observation was made in March of this year at St. Thomas, Dutch W. I., when strong magnetic earth-currents were noticed affecting the cables for some hours *before* the earthquake. Why *before* the earthquake?

**Atheism  
Kills  
Philosophy**

The profound weakness of materialism is its practical atheism (in the Theosophical sense), veiled under the garb of agnosticism, and while it remains so and holds the position that all beyond the sense-perceptions belongs to the "Unknowable," which is almost the same as the non-existent, no real progress can be made except in the direction of utilitarianism; though of course, the *facts* of science may and surely will be used by those who can see more deeply into the inner meanings. The necessary step to be taken before any correct realization of the kind of universe we live in is possible, is to perceive that all things are manifestations of consciousness in different degrees, moving onwards to self-consciousness and that Intelligence is behind the forces of nature. The following few words of H. P. Blavatsky are worth dwelling upon:

The essential power of all the cosmic and terrestrial elements to generate within themselves a regular and harmonious series of results, a concatenation of causes and effects, is an irrefutable proof that they are either animated by an *Intelligence*, *ab extra*, or *ab intra*, or conceal such within and behind the "manifested veil." Occultism does not deny the mechanical origin of the Universe; it only claims the absolute necessity of mechanicians of some sort behind or within those Elements—a dogma with us. . . . Newton recognized fully the limits that separate the action of natural Forces from that of the *Intelligences* that set the immutable laws in order and action. And if a Newton had to renounce such hope (of ever explaining the original impulse given to the millions of orbs, by merely the laws of *known* Nature and its material Forces) which of the modern materialistic pigmies has the right of saying: "I know better"? (*The Secret Doctrine*)  
C. I. R.

**Spiritual Exiles**

THEY have just published in England at an almost nominal price the *Thoughts* of that perplexing colossus Leonardo da Vinci. The fact of the publication at such a price is nearly as interesting as the man himself and far more so than the actual contents of the book. It is now possible for the library of the English working man to be furnished with the best of all the literature of nearly all times and countries. Cheap reprints, running upward in price from even two cents, appear actually daily, and a whole new series of such reprints begins every year or two from one or another publisher. These necessarily answer to a demand, and the demand means that the popular mind is pushing about in all directions, groping, in search of something.

In search of something; for the popular mind is not given to, or characterized by, a mere literary interest, an interest of culture, in bygone literature, recent, older, or archaic.

When medieval religion had full sway, there was no such popular search or demand. The questing instinct was not, for the questions were forestalled in the teachings ere they arose.

But when these teachings were felt out of date the hunger came up in consciousness. For a while it seemed satisfied in a way by the teachings of materialistic science. But these have finally left that particular hunger where they found it. The hunger is an inarticulate question, the question of the ages.

In his way Leonardo da Vinci was on the same quest. Not knowing what he wanted, he wanted his own soul. The hunger did not drive him all over the field of literature. It energized his intellect to a consuming curiosity about every thing save the one thing that would have satisfied it. His mind, never limited to his art, covered the mental activities of the age. But that it was restlessly turned outward instead of inward, constituted the pathos, the almost tragedy, of his life. If he had searched his soul as he searched everything else, he would have found peace.

He knew of the soul but did nothing with his knowledge, did not know that anything could be done with it. He said:

The soul can never be infected by the corruption of the body, but acts in the body like the wind which causes the sound of the organ, wherein if one of the pipes be spoiled, the wind cannot make the music.

In another place he says:

Every evil leaves a sorrow in the memory except the supreme evil, death, and this destroys memory itself together with evil.

Such a character can never be understood except in the light of Theosophy and its teaching of Reincarnation. He was one of those who had once, in some earlier life, probably, nearly reached the great light of life, and then, perhaps when another effort might have carried him to victory, fallen back upon some lesser interest. The stored fiery energy gave him the intellect of the life we know, its power, its tireless aspirations, but the very activity of it held him with his inner hunger unsatisfied. Not a few men, great lights as we reckon them, have thus turned back, and so have been compelled to go hungry for many incarnations, gnawed by their half memory of a nearly won golden age. They are spiritual exiles.  
STUDENT

**Can We Communicate With Mars?**

"NO, we shall never talk with Mars," said a Professor who is described as a "common-sense scientist." He was at all events a dogmatic scientist, and a bold one to state such an emphatic negative. Are such statements reliable as an indication of future possibilities? Experience answers, No. Again there are other scientists who think that we *shall* talk with Mars.

We should have to communicate by flashes of light, said the Professor, and this would be unintelligible for want of a code and from the impossibility of arranging one. Yet other scientists have averred that such a code could be established; and, in view of such facts as the education of Helen Keller and the decipherment of hieroglyphics, it would certainly seem possible. Again we may be able to communicate by electricity or some power not yet discovered—but there is no hurry. H.

# Some Views on XXth Century Problems

## A Half Chapter of Philosophy

A SERIES of articles entitled *The Human Machine*, appearing in an English contemporary, has been exciting considerable attention. The writer supposes the average man suddenly realizing that he is but the average man, that the ambitions of his youth can never be fulfilled; that life offers no more for him than he has already got; that the days to come will be just like the days past—save that powers will slowly fail as old age draws near. The future has no more dawns, only one gray afternoon deepening to a sunset that has no sun.

What shall he do? Shall he accept the situation? Is his cheerless acceptance of it the best he can do with it?

By no means! answers the writer. And then he goes on to translate ably and genially and encouragingly into twentieth century vernacular a fragment of very ancient Eastern wisdom. He may have gone to headquarters for his fragment, or he may have evolved it for himself from that inner consciousness which in all of us contains so much more than we take the trouble to dig out.

Many years ago a little Indian book was translated for the Theosophical Society by its then Leader, William Q. Judge—the *Yoga Aphorisms* of Patanjali. The complexities of the original were simplified, and for the man whom our writer is addressing, this version is better than any of its several predecessors. Whether Mr. Arnold Bennet knows it or not and since we are entirely ready to credit him with honesty, we assume that he does not—he is serving out small doses of that book with deductions therefrom. But he does not give, or has not yet given, the best.

The keynote of the articles, as of the book, is concentration of mind. The discouraged man in his gray afternoon is reminded that he can be much more than he has ever yet imagined. His faults can be cured, his mind energized and developed, and latent powers unfolded. He is invited to test his control of his mind by giving it some one topic or idea to hold and dwell on for half an hour, and by this experiment to find out that half a minute of unwavering steadiness is altogether impossible to him. The mind slips like a globule of mercury under the finger. So he is to cure this weakness by daily attempt to hold the mind still upon one idea for half an hour, being assured that it will grow in health and strength exactly as would his body and muscles from that much time of proper athletic exercise. The idea suggested for the beginning is in the words: *I am not my mind; my mind is my servant and I will teach it to obey me when and for so long as I choose, thinking only such thoughts as I choose and absolutely dropping all others.* We demand that of our muscles. They do exactly what we choose, for as long as we choose, and cease when we have ceased to will.

This is for the thinking machine, to renew its health, to give it more health and more vigor and penetration than it ever had before. Through this, character is to be reformed and

moral failings removed. Mere good resolutions are but one blow of a hammer upon the nail. The weaknesses and failings must be taken into meditation, the mind held daily for a long time upon their absurdity, upon the injury they do, upon the sense of power to surmount them, upon their opposites—until at last their opposites replace them.

This may be very well as far as it goes; but it may also be very ill. The faults that are known to a man may not be all that he has; they may even be a very small proportion. The profoundest selfishness sometimes exists quite unsuspected; to it, the faults upon which attention is concentrated being relatively mere ripples. It might not only be untouched by a mental training directed to remove say the tendencies to give way to temper or sensuality, but might be the cause of the impulse to undertake that training. Being thus daily served, it would grow daily. And when at last, in spite of all effort, the weight of years began to tell and the sharpened mind to dull again, the man would find he was mentally but little farther—ultimately *no* farther—than when he started his discipline; and in character farther *back*, selfishness more deeply engrained than when he began it all. He had merely cultivated for a few years more and keener use the faculties of which death will at last deprive him. He is no nearer to, he is farther from, the only real human victory, victory over death. This victory comes only of the cultivation of that part of consciousness which death cannot touch. And that part cannot be touched or cultured from the motive of selfishness.

This greater work is not only not hopeless but it is easy and pleasant. The service of others is the only pleasure that looks well in memory and that is a lasting benediction to the man who does it. Let him do one good sound act of that kind, involving some sacrifice or trouble; and then, sitting down, feel back into his own nature for the source of that sense of high approval, as from some onlooking divine being, which followed the act. That being exists; it is his own real self, absolutely beyond the reach of death; of which what he has hitherto called himself is but a reflection in the troubled waters of mind and feeling. He must somehow get hold of that self, get his mind into touch with it. The method is dual. He must work daily, at his duty and for others, in such way and spirit as will entitle him to, and will bring, that sense of its divine approval; and in daily meditation or aspiration he must seek it direct. His selfishness will begin to thin out and disappear, a real love for all taking its place. His mind will sharpen and become energized, its faculties ripen. He will begin to understand life and death, finding his own place altogether above the level of those things which the scythe can mow down. And in the very wastes of his own past he will find the richest soil for the growth of the divine plant of his new consciousness.

In the sphere of morals a man can lift "himself" by his own bootstraps! STUDENT

## Women Police

IT is said that encouraging reports upon the efficiency of women as police constables come from Norway and America.

It is noticeable that women often have more power of discipline in a school than men. So long as there is no question of physical strength, their power to control need not be less than a man's and may be greater. True control is exercised by the sympathetic influence invisibly transmitted from a well-disciplined nature to those with whom it is brought into contact; the discipliner holds them, as it were, by an invisible chain—not hypnotic, but of a kind that arouses the will and self-controlling power in the others.

Anything that helps to show women what power they wield over others helps to bring them to a realization of their responsibilities. If they would but exercise the great powers they have, instead of clamoring for powers not worth having, they would have their hands full. Men would have to put them in places of power, as these feminine policemen have been put, simply because of their efficiency. But are there not other spheres of control-duty besides the streets? STUDENT

## A Public Execution in America

ACCORDING to report a sheriff recently admitted 600 non-English-speaking foreigners of his county to witness the hanging of a murderer. His object was to impress them; and photographers were allowed to take photos to be spread abroad as a warning.

A man with ideas like this ought not to be in a position of power. For one per cent of good which the spectacle might do by way of example, it will do ninety-nine per cent of evil in the way of suggestion. Those 600 witnesses and the many others who look at the photographs will have stamped deeply upon their imagination a scene of violence and death inevitably tending outward into future action. In days when public hanging was the rule, the effect upon the imagination, particularly of the young, was so bad that the practice was abolished. Headmasters find it most inadvisable for the same reason to inflict corporal punishment in the presence of the school. The only possible good such an action as the sheriff's can do is to foment a wholesome revolt against the practice of capital punishment. But the revolt would be hardly likely to arise among the witnesses. STUDENT

## In Eight Years!

THIS nation appears to run the risk of de-evolving from one of the soberest of civilization to one of the drunkest. Fortunately we seem to have realized the danger and to be taking measures to meet it. But for a mere eight years the figures are extraordinary. Thus for 1899 the total drink bill was 970 millions of dollars; for 1907 it was nearly 1500—half as much again!

The increase is mainly in the matter of wines, the amount rising from .28 gallons *per capita*, to .67. Spirits have risen from 1.12 gallons to 1.63; beer from 16 to 21. C.

# Archaeology      Palaeontology      Ethnology

## The Denderah Temple

**T**HIS temple stands nearly 400 miles south of Cairo and between 3 and 4 miles from the river. The illustration shows it as it appeared *before* the excavations, about half the height of the columns being then buried. It belongs to the Ptolemaic period, having been built by the last of the Ptolemies on the site of an earlier temple. It was not completed until the time of Nero, and contains royal ovals with the names of Cleopatra, Caesarion, Augustus, Tiberius, Caligula, Claudius, and Nero. The portico, illustrated, contains 24 columns, in four rows of six, about 47 feet high and six wide, the capitals being Hathor heads, four on each column, facing four ways; and above the heads are small temples as abacuses. A low wall connects the columns below, the top of it being seen in the picture.

Beyond the portico is a hall of entrance, a hall of assembly, then another small hall, a small ground-floor sanctuary, and upwards of twenty side chambers. The total length is 220 feet, and the width of the portico about 140. It was surrounded by a vast wall and entered by a single pylon which still exists.

Among the many sculptures are the portrait of Cleopatra and the celebrated zodiac on the roof of the portico. This zodiac, whatever may have been the date of its actual engraving, has been shown by investigation to have been copied from one drawn up long before Denderah was built. It is testimony to the great antiquity of the knowledge of astronomy.

This Zodiac, with its three mysterious *Virgos* between the *Lion* and *Libra*, has found its Oedipus, who understood the riddle of these signs, and justified the truthfulness of those priests who told Herodotus that:—(a) The poles of the Earth and the Ecliptic had formerly coincided; and (b) That even since their first Zodiacal records were commenced, the Poles have been three times within the plane of the Ecliptic, as the Initiates taught.—(*The Secret Doctrine*, vol. II, p. 368)

## Hilprecht Vindicated

**T**HE news states that Professor Hilprecht, the Assyriologist of the University of Pennsylvania, has obtained so fully the backing of his university against the attack made on him by another (and reverend) archaeologist, that little has been heard of the matter recently. Since the publication of Hilprecht's book, the accuser has modified his judgment and the incident may be considered closed. As nearly as the laity can understand, says the report, Professor Hilprecht was careless in the form of his original statement, and conveyed the idea that certain articles were found in his "temple library," which in fact were not found there, but used (in the absence of the actual articles) to illustrate the character of the contents of the library. Regarding this controversy, the following is condensed from *NEW CENTURY PATH*, vol. viii, no. 32:

Lomaland Photo. and Engraving Dept.

PORTICO OF DENDERAH TEMPLE (BEFORE THE EXCAVATIONS)

The discoveries of Hilprecht so enlarge our ideas and threaten prejudice that one would expect to see unfortunate attempts made to depreciate them in quarters where the forces of dogma entrench themselves.

The attack resembles the kind that is always made by prejudice against liberal thought. The whole vast question of archaeology is ignored in the insistence upon one or two petty charges; and these charges suggest that familiar kind which is apparently unanswerable, yet so easily explained when the suppressed facts are made known. The fact that Dr. Hilprecht disdained to reply to such vague and malevolent aspersions was made capital of. Well he might disdain, for what innocent and honorable man will meekly walk into a pillory erected for him in the market-place, there to defend himself against charges so vaguely couched that their very denial must convey an impression of contamination?

Dr. Hugo Radaw, Assyriologist of Columbia, Munich, Göttingen, etc., defended Hilprecht. He testified that Hilprecht did discover a library, for Radaw examined 300 tablets taken at random from a collection of 17,000 or 18,000. As to the tablets alleged by the accusers to have been purchased in Arab bazaars, it is only too likely that the excavations having been open for years, some perfectly genuine tablets from them would find their way to the bazaars and be bought by an archaeologist recognizing them. The defender said:

"It is surprising how many persons seem unmindful of the fact that in this collection the University of Pennsylvania is the proud possessor of one of the most ancient and extraordinary historical treasures owned anywhere in the world. It is even more surprising to me, as an outsider, that in Philadelphia, the city of its custody, all hands are not raised in support of the work Professor Hilprecht has done, rather than tongues employed in criticism. To anyone familiar with the facts, such a situation is attributable to a condition of ignorance founded on a network of malicious and jealous fabrications, rather than the expert judgment of those who are able to speak."

The whole case appears to be one of those in which the timorous and time-serving school has felt resentment against the go-ahead-and-do-something school, and has vented that resentment by a criticism of "methods." In the life of a busy man it is always possible to find some details that might have been done better.

## Assyrian Elephants

**I**T is stated that ancient Assyrian records afford practically conclusive evidence that elephants formerly existed in the Euphrates valley; and that this is confirmed by the discovery, in Armenia during the Crimean war, of fossil remains of an elephant intermediate in species between the present Indian elephant and the mammoth. In connexion with this it is also said that an American model of one of these animals was set up with the tusks curving downwards, giving rise to the theory that the elephant was a digger; but it seems that the tusks on the model were put on the wrong way up.

## Six-Story Cliff Dwelling in Colorado

**S**OME years ago the group of cliff dweller ruins known as Balcony House, Spruce Tree House, and Cliff Village was discovered in the cañons of the Mesa Verde in Southwest Colorado. But last summer a still more wonderful ruin was found in the same neighborhood. In Spruce Cañon, within two miles of Cliff Palace, was found a six story dwelling containing more than forty rooms and in a good state of preservation. It has been called "Peabody House." It is remarkable how things can exist even above ground without ever being suspected; and it is expected that future explorations in Mesa Verde will result in still further discoveries.

## Metaphysical Biology

THE old theory of gemmules, according to which every organ—even every cell—of the body contributes to the formation of the new individual, that is, to the germ plasm and so makes heredity comprehensible, might perhaps have been exploded by every gardener. And every gardener might have thrown some light upon the location of the germ plasm in the body, coincidentally suggesting the essentially metaphysical character of that substance.

Most plants and trees can be made to grow from cuttings; theoretically perhaps all can. In the case of some plants the "cutting" may be as little as one leaf, even part of a leaf; theoretically perhaps any cell of a leaf.

On the animal side, some of the lower organisms can reproduce themselves from a mere fragment. In those that consist of one cell, any part of this cell, provided it contain a fragment of the nucleus, will do.

But if we consider the case of a leaf, which, separated from the parent, reproduces the whole plant, root, stem, leaves, and finally flower, is it not clear that that leaf, and even every cell of it, must have contained germ plasm?

If so, dividing by the number of cells of this new plant, the quantity of plasm contained in the leaf from whence it came: and dividing by the number of cells in the parent plant; the quantity of plasm it received from its parent in the seed from whence it sprang: and so on backwards—is it not obvious that the continuity of the germ plasm is rather a *metaphysical* than a physical continuity?

It can hardly be said that we have any physical analog to the process. Break a magnet weighing a pound into spicules weighing a grain. With one of these, magnetize a bar of steel weighing a pound. Break that into spicules, and so continue, say a thousand times. How much of a magnet will be your final bar? But the germ plasm is a spicule of the *thousandth* bar capable of conferring on the thousand-and-first bar a magnetism equal to that of the *first*. And the analogy immensely simplifies the case for the sake of illustration.

Is not the germ plasm rather a dual *force* than a bit of matter, even though it takes successive embodiments in bits of matter? It is a metaphysical duality since it consists of a plan, an idea, a form, and the magnetic or guiding force necessary to attract or fashion matter according to that form. Biologists may not like to find themselves in any such "morass of metaphysics," but they are there nevertheless.

## The Nature Mind

ONE of the calculating prodigies, a man as it happens of intellect and education, contributes to a contemporary some account of his compeers past and present in the possession of his own power. But he does not draw the inference which nevertheless is so strongly suggested by his record.

Is the power mental? If we say yes, then

we must relegate it to a mind quite other than that which reasons on ordinary lines and matters, quite other than that to whose work we apply the word intellect. For intellect and the prodigy's calculating power seem wholly unconnected.

Thus the writer notes that "there is nothing more striking about the mathematical prodigies, nothing which has been the subject of more uncritical amazement, than their almost uniform precocity." That is, the power is often in full swing long before intellect has done much more than stir. Thus it has shown itself at the ages of 3, 4, and 5.

Its degree has no relation to the degree of intellect or general intelligence. It has flourished magnificently in men who were otherwise almost idiots. It may or may not grow as intellect grows; it may disappear as intellect reaches its development. It has no connexion with art or with capacity in any of the arts or sciences.

Most significantly, it sometimes disappears with the acquisition of school and college arithmetic, with knowledge—by the other, intellectual, mind—of the rationalized rules of calculation. It is not a reasoning arithmetician in the way that the other may become under ordinary tuition.

It is in fact a nature-mind and its workings a nature-process. If we could bring our other mind into cognizance of this one's workings without interfering with them we might learn how we digest food, how we move our muscles, how we repair waste tissue, and so on. Fortunately we do not know how to try. There are other parts of our nature much more immediately important for us to understand and either dominate or co-operate with.

## Pigeon Etiquette

IN *Science* is reported an attempt to explain on sociological lines the cooing, dancing, strutting and other performances on various occasions of pigeons and doves:

Just as the primitive man must perform a certain ceremony upon every important occasion in his life, so the pigeon must give a certain call or coo, and must go through a bowing or strutting performance upon all important occasions; as, when he wakes in the morning, when he goes to roost at night, when he joins the flock (and so on).

Zoology and psychology, it seems, will not explain. Sociology must come to the rescue. But when come, the rescue is not obvious.

The utility of these pigeon performances is the same as that of ceremony in primitive man—social control. . . . The pigeon is a true free individual, hence social ends among pigeons can be secured only by some means of social control; . . . the actions of the different individuals in the family are connected and socialized through control by ceremonial observances.

The pigeon must be a marvelously intelligent creature if he has evolved a complicated system of ritual, governing all he does, merely in order to keep himself in order and unify himself with the clan.

Every state of feeling consciousness, whether

in man or animal, tends to come out finally as a physical motion and attitude. It is by that process, among others, that the body becomes more completely evolved, and the state of feeling ensures its own future better and fuller reproduction. Men often find that the easiest way to reproduce a feeling is to produce the bodily setting of it. The motions of the doves may not seem to us very well related to the feelings we assume them to have, but then we are not doves!

The ceremonials of "primitive man" are of quite another order. Surely sociology has shown them to be magical. And Theosophy adds that they are remains of far more complicated ceremonial in use among the forgotten races of which "primitive man" is in every case a relic.

STUDENT

## Blended Waves in the Germ

A BIOLOGIST, studying the development of hybrids in embryo, that is, the embryonic development of organisms resulting from the union of more or less unlike parents, finds that the influence of the paternal and maternal factors alternates in slow waves, now one and now the other dominating. The final result at birth, therefore, represents the work of the two sets of waves.

It would seem that this oscillation persists throughout the life of this new individual; at any rate the law of Mendel, according to which the offspring of hybrids tend to sort themselves out into the original types, would find in that persistence a possible explanation. For as these offspring arose in the body of the parent—and the origination is mostly successive even when several are *born* together—they would resemble that one of the *grand*-parents whose wave was at that time running or predominant. Either of these waves might be reinforced from the other parent, resulting in offspring predominantly of that type.

Atavism, or reversion to extinct types, also finds here a possible explanation. White light, which contains all the colors, may be made to appear of any color by adding to it an extra ingredient of that one. So the germ plasm, in coming down from the past, contains all the waves contributed to it by its hosts, representing the peculiarity of each. Any one such wave, deeply hidden amid the rest, might be accentuated by a variety of causes. A succession of slight accentuations might have been gradually bringing it to the front for long periods of time, and at last it becomes strong enough for sudden manifestation.

## Biological Blood-Analysis

THE new method of blood-analysis, perfected by Professor Nuttall, promises to solve several open questions in zoology. It reveals relationship where none was supposed, and the absence of it where it was suspected or believed. The walrus turns out to be a horse, the hippopotamus a pig. It corroborates the known relationship of bird and reptile. And it shows that man has no tie with monkeys whilst having a very faint one with the anthropoids. Naturally, for they are an *offshoot* of humanity.

## The Conservation Conference

**P**RESIDENT ROOSEVELT'S Conference of State Governors and others, on the protection of resources, marks an epoch in the art of managing public affairs unofficially and yet with the advantages of unity.

The President in his opening address said that the Conference was a meeting of representatives of all the people of the United States to consider the weightiest problem now before the Nation, our national resources being in danger of extinction if we continue the old wasteful ways of using them.

When the founders of this Nation met at Independence Hall, the conditions of commerce had not fundamentally changed from what they were when the Phoenician keels first furrowed the Mediterranean. Anthracite coal was a useless stone; the great fields of bituminous coal were undiscovered; steam was unknown; water and labor were the sources of power; iron was little used; wood was used locally and forests were regarded as obstructions. The development since then has been a most striking phenomenon. But, while we have discovered so much, we are more dependent on nature than ever before.

Washington saw that the perpetuity of the States could only be secured by union, and that the only feasible basis of union was commercial. He helped to outline a scheme of commercial development, and by his influence an interstate waterways commission was appointed by Virginia and Maryland. The Constitution thus grew largely out of the necessity for united action in the wise use of natural resources. Once more there is the call for united effort.

Steam and electricity have revolutionized the industrial world. The discovery of mineral fuels, alloys, coal, and iron, the resources of our forests, the richness of our soil and the facility of transportation, have made the conditions of life unparalleled in comfort and convenience. But these resources have reacted to promote the complexity of life.

"So great and so rapid has been our material growth that there has been a tendency to lag behind in spiritual and moral growth; but that is not the subject upon which I am to speak to you today. Disregarding for the moment the question of moral purpose, it is safe to say that the prosperity of our people depends directly upon the energy and intelligence with which our resources are used."

Here one would pause to say that the moral purpose can not be disregarded, and indeed was not this what the President meant? As is the moral purpose, so will be the result of the energy with which we use our resources. If we are on a wrong tack, we should be better without so much energy. The word "intelligence," as used, begs the question; in its better sense it implies the moral purpose; in a worse sense it implies a quality that would abuse, not use, the resources. To continue:

These resources are the final basis of national power and perpetuity, said the speaker. [Again one would remark that they are quite secondary to character. Sterling character is developed amid stringent conditions; afterwards its prowess enables it to achieve resources. Then a great civilization grows and the character tends to succumb to the prosperity. Nations have to learn to avoid

this. But it is clear that character is the controlling influence and not resources.]

These resources are in course of rapid exhaustion. The limit of unsettled land is already in sight, and little land fitted for agriculture now remains unoccupied save what can be reclaimed. We began with an unapproached heritage of forests; more than half the timber is gone. We began with coal-fields more extensive than those of any other nation and with iron ores regarded as inexhaustible, and many experts declare that the end of both is in sight. The mere increase in our consumption of coal during 1907 over 1906 exceeded the total consumption in 1876. The enormous stores of mineral oil and gas are largely gone. Our national waterways are not gone, but they have been so injured by neglect that there is less navigation than fifty years ago. We began with soils of unexampled fertility, and we have so impoverished them by injudicious use and failing to check erosion that their crop-producing power is diminishing instead of increasing.

Some resources, like mines, must be exhausted in time; and of them we have to learn the most conservative use. Other resources are renewable, such as the soil, the forests and the waterways; and these we must learn to use so as to make them continually renew themselves. In former times people moved West when the soil was exhausted or the forest cut down, and took to the railroads when the river became choked. Now they can no longer do this. So it is necessary for the father to exercise wisdom if his son is to make his living, for he must make it on the same farm. But—

"No wise use of a farm exhausts its fertility. So with the forests."

All our methods of conservation and reproduction need to be co-ordinated in a coherent plan and not treated in haphazard and piecemeal fashion.

"We are coming to recognize as never before the right of the Nation to guard its own future in the essential matter of natural resources. In the past we have admitted the right of the individual to injure the future of the Republic for his own present profit. The time has come for a change."

There are signs that the people are awaking to this truth. The supreme court of Maine decided, in regard to questions as to the right of the legislature to restrict the cutting of trees on private land, that the duty of protecting the soil from drought and the waterways from choking was paramount, and that the property-rights of the individual are subordinate to the rights of the community.

"Finally let us remember that the conservation of our natural resources, though the gravest problem of today, is yet but part of another and greater problem to which this Nation is not yet awake, but to which it will awake in time . . . the problem of national efficiency, the patriotic duty of insuring the safety and continuance of the Nation. When the people of the United States consciously undertake to raise themselves as citizens, and the Nation and the States in their several spheres, to the highest pitch of excellence in private, State, and national life, and to do this because it is the first of all the duties of true patriotism, then and not till then the future of this Nation, in quality and in time, will be assured." H. T. E.

### Continuous Life under Perfect Law

"CONTINUOUS life under perfect law" — such is the picture of life presented by Theosophy. No "fortuitous collection of atoms," no "chance" effects, no puppet-humanity swayed hither and thither, spineless and will-less. Not at all. Rather a host of incarnated gods, purposeful, strong, at ceaseless work on the divine plan of an ultimately perfected humanity as the result of human effort.

We have both a spiritual and a physical nature. United in consciousness with the spiritual, it is within our power to become god-like; but when identifying ourselves with the physical nature we experience, as the animals do, the same sensations of heat and cold, hunger and thirst, passion, appetite, desire for material comforts; and because of being more than animals, having as well the power of mind, we perversely add to the category of these lower animal qualities, ambition, avarice and pride.

The pivotal point in Theosophical teachings is the essential divinity of man; man — the Thinker, the inner Mind — is not and never was, an animal, though he inhabits an animal form. The true man is a ray of the divine, incarnating on earth for the purpose of gaining experience by passing through every plane in nature and gaining mastery over the lower forces, through practical experience and the attainment of self-control. By fulfilling his duty as man, that is, as a divine soul, man raises the kingdoms below him to a higher state of consciousness; the animal nature becomes docile and obedient to the dictates of the master, the god within, and evolution proceeds in a normal manner.

It is because humanity has lost sight of its true nature in the whirl of the materialistic life with its false delights and sensations; it is because it has forgotten its essential divinity and become selfish that it has had to suffer all through the darkness of ages, and it is because of its wider opportunities and the misuse of these that it has in some respects sunk even lower than the animals.

But it is not in the divine plan which is engraved in the spiritual consciousness of humanity that men should remain forever degraded and halting and ignorant. The law of harmony eternally existing exacts the penalty of infringement, and by pain and suffering forces man at last to act in accordance with it. Again and again he may break the harmony and again and again must he suffer until finally he learns the cause of suffering and the way to escape therefrom. Theosophy comes to our aid, teaching us of immortality, of the purpose of existence, of life governed by perfect law, from a knowledge of which we may escape from pain and the penalties of ignorance. It teaches us that we may be the lords and rulers over, or the slaves to, the

many physical forms that we inhabit in our repeated incarnations on earth; and that according to the way we live now, so shall we be either lords or slaves in the future, either rulers or prisoners, just as we please. If we serve Mammon there is no alternative but that we shall find ourselves slaves in our next and succeeding lives; but if we cling to the highest, if we seek to realize the divinity of our natures, if we control the lower animal nature and stamp out greed, lust, anger and ambition, just so far are we learning to rule in the outermost sphere of our existence and growing our wings for freedom.

But to attain to this conquest over self it is not sufficient to make one fierce effort to dominate the lower nature; it is by the unrelaxing steady effort applied to the small things of life, to the every-day thoughts and feelings and the every-day duties, that at last the soul gains control and blossoms out in the sunshine of freedom. No more can this be done in a moment than a seed can in a moment blossom into a perfect flower.

The perfect law brings us back to earth, life after life, wherein we reap the exact result, not merely of the great things, but of the small things of the past, both in character and circumstance. Of these character is the more important, for circumstance changes, it can be over-ridden, but character is the very vesture of the soul which it carries over with it from life to life, adding to and modifying by every act and thought just as the tapestry weaver adds to and modifies his design by stitch after stitch of the many colored threads.

Are we appalled when we think of what we have yet to accomplish in order to obtain the mastery? Said a wise Chinese philosopher, "the journey of a thousand miles begins with the first step." H. P. Blavatsky, in the *Book of the Golden Precepts*, has taught us to

Have patience, . . . have perseverance, . . . as one who doth for evermore endure. Thy shadows [personal selves of succeeding incarnations] live and vanish. That which within thee *knows*, for it is *knowledge*, is not of fleeting life. It is the man that was, that is, and will be, for whom the hour shall never strike. E. I. W.

### Theosophy --- the Only Remedy

THE majority of people are ready to admit that there is something radically wrong with human life and customs as we see them today, and are looking about for a clue to something that will explain it all, and offer a solution or remedy.

Science deals with but one phase of the question, and in science much that is declared as truth one day is denied the next. The churches and theologians are fast proving themselves incapable of dealing with the situation. So-called education tends toward the fostering of selfishness. Commerce is based upon ill-fated competition, which might well be considered an exaggerated individualism, or better, personalism. Each individual or corporation strives for personal supremacy, wilfully ignoring and sacrificing any and every thing that may interfere with their material advancement.

Some look upon existing conditions as hopeless, while others regard them with a blind hope which they feel, but have no definite knowledge upon which to base their conclu-

sions. The message of Theosophy is to both these classes.

Theosophy explains that which other systems leave unexplained, and those who are truly seeking a remedy for the selfishness and suffering of the age are turning to the old Wisdom-Religion with a question as to what it is in Theosophy that is vital — able to transform life and living.

The greatest stumbling-block in the way of the public mind today is ignorance; ignorance of the laws of life; ignorance of the real nature of the universe and of man; ignorance of the true meaning of education; ignorance of the spiritual unity of man, and of the unflinching justice of the Moral Law, which we recognize on the physical plane as cause and effect. Add to this the marked indifference of the so-called public and we have just cause for conditions of life such as we see on every hand.

Theosophy admits of no separateness. It does not recognize one law for life on earth and another totally different law for life hereafter, but affirms there is but one eternal, immutable justice which governs and guides the whole process of evolution, from the highest conception of creation down to the lowest atom.

When men begin to turn their minds toward this law with the motive of gaining knowledge concerning it instead of merely to deny it, and when they begin to live in harmony with the knowledge they gain instead of seeking to appropriate it for personal, selfish ends, as many are doing at the present time, then may we begin to lay the foundation of a true and enduring civilization. M. R. F.

### Parental Responsibility

IT has been shown by statistical investigations made some years ago, that if, in a family of children, some were born while the parents were abstainers from alcohol, and some after one or both had become excessive consumers of it, the latter group exhibited marked tendencies not possessed by the former. These tendencies included epilepsy, idiocy, insanity, and mental peculiarities of various kinds.

This is an extreme case, but it will do as an example. Parenthood often extends over a period of many years, during which time the characters of both parents may undergo marked change. Beside their advance in years; their habits and degree of health vary; their love for each other, their comradeship, deepens or disappears.

It is therefore but natural that the children coming to them should tend to be unlike each other. If the tie of affection between the parents has disappeared with years, if one has grown in mind and spirit and the other gone backward, if *any* marked change has come about, the souls that were once attracted to them for birth will be so no more.

Our bodies are changing every second, passing away and being rebuilt. And our minds have their moods from day to day and even from hour to hour. Who knows what one single hour or even moment of passion or anger may do in affecting the child born perhaps long after?

Some day these things will be understood and acted upon, and then almost a new humanity will be possible. H. C.

## A MORNING SUMMONS

Archibald Lampman

UPON the outer verge of sleep I heard  
 A little sparrow piping in the morn;  
 Unto my very heart the sound was borne;  
 It seemed to me a something more than bird,  
 Even Nature's self that touched me with a word:—  
 "While thou sleep'st on, I have not done my duty.  
 Awake, O man! Of all this gift of beauty  
 Lose not one grain. The forest deeps are stirred  
 With morning, and the brooks are loud afflow."  
 Perhaps it was a dream, but this I know,  
 Behind me, as I passed into the sun,  
 Whether to me or each one to his mate,  
 I heard the little sparrows one by one  
 Piping in triumph at my garden gate.—*Selected*

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell.

## Question

Is there any finality about Reincarnation? "Except ye be born again," etc., seems to imply only once; or are we to play many parts in the world's history?

## Answer

The gulfs that separate one man from another are enough to answer this question. You do not need a text from any scripture to assert it to you, seeing what men are. Mars and Jupiter are not farther from the earth, than perhaps you are from your next-door neighbor; and you could not so come together as to able to talk the same language, or see the same relevance in things until—one more life?—thousands more of lives had passed over the one or the other, or both of you.

As for the text quoted, it was surely not spoken of Reincarnation. The context shows that it refers to an interior and spiritual birth, a coming into a new range of one's own possibilities, the entering upon possession of a new inherited kingdom. "The wind bloweth where it listeth," says the text; and this revelation is like the wind, in that you cannot tell when its advent will be, nor whence; nor whither its departure.

There is an inexplicable mystery for us in every one we meet. All the sounding lines in the world will not suffice to sink a plummet into the depths of a child's consciousness. The finality of Reincarnation is to be thought of when you have gained all that the world has for you; also, when you have given to the world all the stores you may have hoarded or are to gain. What use would another world be to you, if you had left anything not perfectly comprehended on this one? As well might a general leave a fortress held by the enemy in his rear. Of all the millions of men and conditions on the earth, we know some few, well or ill; and the rest not at all. Yet have we come out here to make all our own; so that we should know the two poles and the equator of mentality, and be familiar with the aspect of every human mood. You cannot help unless you can understand, and helping is the great business of life.

We are too apt to take up the coward's or the sluggard's attitude with regard to life as a whole; we demand that the least should be asked of us, and to be forgiven for slipshod or non-accomplishment of that. But let us by taking thought renew our youth, and go forth conquering and to conquer. Is perpetual rest to be for us after a paltry sixty years

—after a paltry sixty lives? Or shall we claim this world for our own, ourselves most proper and native to it and utterly bound up in its interests—and shrink from the thought that our connexion with it should cease?

There are millions and millions of men, and millions little better than the beasts—nay, much worse, for with their human mentality they have gone to work to find out ways of blaspheming against the laws of being—and all these are to shine out with their innate godhood before all is over.

Whole life-times, perhaps, before the first little lesson can be learned. Criminals evolved in many centuries; knotted and twisted souls who have long pitted themselves fiercely against all beauty and peace, a scourge upon their fellows and themselves—shall we take no account of these? They must learn; some raindrop of enlightenment out of some unfathomable sky must reach them at last, so that the universe will look new to them, and such instruments of our education as pain and the pressure of all humanity upon us will seem to them no longer things to be railed on or snapped at fiercely with long wolf-fangs of distrust; but gentle and to be endured; friendly, not hostile, when their purpose is known. And then, the long probation of endeavor to correct mistakes, the patient effort to disentangle what so many lives have built up, the strength of purpose growing up from so long opposition to so many failures and mistakes, the wisdom broadening out, the compassion-glow beginning and increasing—is all this to be done in one life or a few lives? Or in a thousand lives? Yet this man, too, is an atom of our being, a companion who could not be left behind.

All men are such companions to us in truth; and those most alien must become as near and well-understood as whoever is nearest. How shall we speak of the end of reincarnation then? We have so much to do, such rare and royal adventures to undertake. It will take us millions of ages yet, before we shall have the right to feel the least weary of this many-changing wide, man-demanding world.  
 M.

## Answer

II. So often a wrong interpretation may be put on an isolated statement apart from the context, so let us look at the context in this particular instance. It is from the story of Nicodemus, a ruler of the Jews, a Pharisee, who came to Jesus by night and said:

Rabbi, we know that thou art a teacher come from God: for no man can do these miracles that thou doest, except God be with him.

Jesus answered and said unto him, Verily, verily, I say unto thee, Except a man be born again, he cannot see the kingdom of God.

Nicodemus saith unto him, How can a man be born when he is old? Can he enter a second time into his mother's womb and be born?

Jesus answered, Verily, verily, I say unto thee, Except a man be born of water and of the Spirit, he cannot enter into the kingdom of God.

That which is born of the flesh is flesh; and that which is born of the Spirit is spirit.

Marvel not that I said unto thee, Ye must be born again.

The wind bloweth where it listeth, and thou hearest the sound thereof, but canst not tell whence it cometh and whither it goeth: so is every one that is born of the Spirit.

It is plain that this particular passage refers not to the rebirth of the physical body, but to a rebirth into a new life, a spiritual birth into the heritage of the soul.

As to the question, Is there any finality in Reincarnation, are we to be players of many parts, etc., the inquirer is referred to our Theosophical literature, especially the *Theosophical Manuals*, and the *Key to Theosophy*.

The teaching is that there is finality in Reincarnation on this earth, in the sense that it is possible to reach to that stage of development in which there will be no further need to reincarnate, no further causes to draw the soul back to earth. But this cannot be until all the experiences of earth-life have been passed through and all its lessons learned. This must mean the playing of many parts, and the coming back many times. Surely, if we are wise we shall not concern ourselves with the thought of escaping Reincarnation, but be content rather with doing our whole duty, relying on the Law. There can be no finality to life, or to experience and development. That which does concern us is the fact that we can make our life and our many lives full of joy, crowning them by the service of others; or full of pain and sorrow, a burden and a curse—but we cannot escape from life nor from incarnation until the whole round is completed. As said in the *Bhagavad Gītā*:

Death is certain to all things which are born, and rebirth to all mortals; wherefore it doth not behoove thee to grieve about the inevitable. . . . What in this is there to lament? . . . This spirit can never be destroyed in the mortal frame which it inhabiteth, hence it is unworthy for thee to be troubled for all these mortals.

## The Higher and the Lower Self

THE HIGHER SELF is

THE SPIRITUAL divine Ego is

THE INNER or HIGHER "Ego" is

THE LOWER, or PERSONAL "Ego" is

Ātmā, the inseparable ray of the Universal and ONE SELF. It is the God *above*, more than within, us. Happy the man who succeeds in saturating his *inner Ego* with it! the spiritual soul or *Buddhi*, in close union with *Manas*, the mind-principle, without which the former is no Ego at all, but only the *Ātmic Vehicle*.

*Manas*, the "fifth" Principle, so called, independently of *Buddhi*. The Mind-Principle is only the Spiritual Ego when merged *into one* with *Buddhi*; no materialist being supposed to have in him *such* an Ego, however great his intellectual capacities. It is the permanent *Individuality* or the "Reincarnating Ego."

the physical man in conjunction with his *lower Self*—i. e., animal instincts, passions, desires, etc. It is called the "false personality," and consists of the *lower Manas* combined with *Kāma Rūpa*, and operating through the physical body and its phantom or "double."

(From *The Key to Theosophy*, by H. P. Blavatsky).

THEOSOPHY does not teach that the passions are to be pandered to or satiated, for a more pernicious doctrine was never taught, but the injunction is to make use of the activity given by the fourth principle so as to ever rise and not to fall under the dominion of the dark quality that ends with annihilation, after having begun in selfishness and indifference.—*William Q. Judge*

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Why?

THERE were even those amongst the highest Epoptae of the Greater Mysteries who knew nothing of their last and dreaded rite—the voluntary transfer of life from hierophant to candidate, the mystical operation of the adept's transfer of his spiritual entity into the youth he loves with all the ardent love of a spiritual parent. . . . The body can scarcely be kept alive beyond the ten or twelve score years. The old garment is then worn out, and the spiritual Ego forced to leave it, selects for its habitation a new body, fresh and full of healthy vital principle.

Once that an adept was initiated into the last and most solemn mystery of the life-transfer, the awful Seventh rite of the great sacerdotal operation, which is the highest theurgy, he belonged no more to this world. His soul was free thereafter, and the Seven mortal sins lying in wait to devour his heart, as the soul, liberated by death, would be crossing the Seven halls and Seven staircases, could hurt him no more alive or dead; he has passed the "twice seven trials," the Twelve labors of the final hour.

The high Hierophant above knew how to perform this solemn operation by infusing his own vital life and astral soul into the adept, chosen by him as his successor, who thus became endowed with a double life.

The foregoing was written by Madame Blavatsky in the early days of the Theosophical Society when she had just begun her teachings to the world. Why was it written?

The asking "why?" in regard to anything, provided the "why?" is asked in a proper mood, is an indication of interest and respect, in some cases of reverence. It is well to query "why?" constantly. From childhood to life's termination this question should constantly be put. It should be put to the stars and to the planets; to the cities and to the wastes; to the night and to the day; to the friend and to the enemy; to virtue and to vice; to weakness and to strength; to the dust and to the diamond; to the scientist and to the theologian; to the itinerant and to the dilettante; to the artist and to the merchant; to the work of art and to the work of nature; to the infinitesimal and to the infinite; to the gods and to the fiends.

It has been said that "for the sake of the soul alone the universe exists." Therefore it, the universe, should be incessantly asked "why?" The universe is the great educator; the objectivization of the eternal inscrutable omniscience. It educates by continually stim-

## MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

ulating the mind to ask "why?" To ask "why?" is more important than to ask "what?" A man unacquainted with modern human life see another man walking in the rain with a raised umbrella. The next day he goes out with his umbrella raised beneath a cloudless sky. Why? Because he imitated the act without advising himself as to its purport. A man is a day-laborer and a hearty eater. Another man, not doing heavy work, imitating the laborer in eating, would not fare well though he had fared too bountifully. The day-laborer, noting the spare diet of the invalid and trying to adapt it to his own uses, would find his labor impaired from want of bodily sustenance. These are far-fetched illustrations, it is true, but they are only intended to show forth by analogy a sometimes disregarded truth.

H. P. Blavatsky was a wonderful woman. As the years pass by this is being increasingly recognized. She never said or did anything purposelessly. Her whole life was an intense sacrifice in which she was constantly giving of her own spirit to others and taking upon herself their woes and sorrows. Look at her face, as pictured in the latter years of her life. Note the expression. The eyes, the look of appeal, of grief, of pathos! The tale thus read is of one who was everything for others, nothing for herself. Now why did such a one make such a statement as before quoted? In reading her writings, full of clever raillery, keen wit, caustic reproof, inimitable ridicule, spontaneous humor, mirth-provoking nonsense, one is frequently startled by seemingly abrupt breaks in the continuity of the argument, unexpected presentations, weird pictures, strange facts, and almost incredible statements. Was this done motivelessly? Surely not. Then why? Was it not done because self-psychologized humanity had settled in a slough of ecclesiasticism, or was headed for an exitless cul-de-sac of materialism, and had to be jarred, startled, jostled, and driven out of its positions?

But why reveal a profound mystery which

has no possible application to the reader? Why did Mr. Judge bring forth similar facts such as this: "The change of a man into another class of being—such as that of a celestial being—is effected by the transfusion of natures"? The main if not the sole purpose of this and kindred statements was to point out the fact, in the manner which

would most impress it on the attention, that human entities are entirely distinct from corporeality. It was, at first, of slight moment whether these statements were or were not accepted. The mind had, primarily, to be made accustomed to a conception, new and odd to the epoch, especially new and odd in the Occident—this conception of man as *something else than a corporeal entity*.

Was the work accomplished? Yes, and thoroughly. Few realize to what an extent present civilization has been impressed and modified by the labors of Madame Blavatsky, Mr. Judge, and the present Leader of the Theosophical Movement. Few, too, realize the wonderful change in the years since Madame Blavatsky's work for humanity was started in New York City, in 1875. The Theosophical work is infusing—if slowly—the essential qualities into our civilization, and thanks to it, there is a fair promise that Pluto's realm will be changed into a *bona fide* fairy land. H. T. P.

## Protection from Tropical Heat

IN a recent lecture at the United Service Institution, London, Col. Maude pointed out the relation between actinic rays and their effect upon the nerve centers running down the spinal column. If excessive the disturbance reacts upon the stomach, as well as provoking the malady of sunstroke. Those who lined their wearing apparel and helmets with a red fabric, have, it was stated, secured instant relief from the afflictions incidental to working in a torrid blazing sun. That distinct benefits accrue from the use of red shirts is borne out by the experience of many working in the shadeless plains of Nevada, where the summer temperature is sufficient to raise iron to an unbearable heat, and who nevertheless, clad in their red shirts, pursued their tasks for hours on end in the broiling sun without suffering bodily pains or ill effects of any kind. It would seem that these facts, if reliable, should be more widely known. J.

# The Theosophical Forum in Isis Theater

S a n D i e g o C a l i f o r n i a

## Last Sunday Evening in Isis Theater

Mr. H. T. Edge Speaks on "Ancient American History"

AN address, both profoundly suggestive and showing careful research, was read by Mr. H. T. Edge at Isis Theater last Sunday evening. It is really astonishing that whereas a new way of spelling the name of some Chaldaean monarch sets the archaeological authorities a-buzz, there lie buried in tropical forest and on the plains of the Tibet of the New World (the Andes' plateaux) structures equaling Egyptian workmanship and a thousand times more mysterious, which antiquaries almost forget!

Selections from Mr. Edge's address are reproduced. OBSERVER

It is often quite refreshing to get a glimpse into spheres entirely different and to be able to imagine a history that has nothing in common with the familiar history of Europe and the story of Christianity. Recently we heard in this hall a lecture on the Wisdom-Religion of the ancient Celts, the predecessors of the Druids, and were surprised to hear that they had knowledge and faith so far surpassing in scope and grandeur the Church teachings which were brought to them in their declining years by the missionaries from Rome. It gave us a new point of view—an idea that perhaps after all, Christianity does not represent the last word of knowledge on every subject, and that even Christianity may be but the heir of ancestors that were greater than itself.

In America likewise we have the records of a history that will open up to us entirely new fields and introduce us to civilizations that flourished independently of those we are so familiar with in the Old World.

In Central America, in Mexico, Guatemala, etc., and also in Peru and adjacent countries, are found stone ruins of a size and massiveness comparable only to those of ancient Egypt. Their architecture evinces an engineering skill, a vastness of conception and of execution, such as could emanate only from a people of the highest civilization and the greatest resources. These stones are carved abundantly and intricately all over with symbolical figures which have the value of a hieroglyphic language, part of which has been interpreted by ingenious and patient students, but the bulk of which still defies their efforts to interpret it. These ruins were certainly not the work of the Aztec and Inca races whose remains the Spaniards found when they came. The ruins were old even in the days of these peoples, nor were they able to tell who had erected them.

When the Spaniards came, they found not the signs of primitive man struggling up on his way towards civilization, but the remains of decaying civilizations—civilizations which had once been great and grand, but now were in the days of their decline, through strife among themselves. We have the records collected by such historians as Prescott, and they present the picture of races succeeding races, successive invasions of peoples, driving out the settlers whom they found and settling in their turn. But the origin of all is lost in obscurity and legend. Only all alike agree in believing that in the remote past there was a greater grandeur and knowledge and that the people from whom they sprang were greater than themselves.

The speaker then quoted extensively from

an article by H. P. Blavatsky entitled "A Land of Mystery," recently republished in the CENTURY PATH. Continuing he said:

Where did these civilizations come from?

The most remarkable point is the wonderful similarity between the building designs and the symbols on the buildings to those of ancient Egypt. We have pyramids and huge temples. And the calendar stones of Central America are graven with mathematical and astronomical lore, couched in emblematic language, just as we find in ancient Egypt, though the hieroglyphics may be different.

The key to the whole problem, and of other problems of the same kind lies in the fact that we must take a much larger view of history than we have been accustomed to take. It is absurd to limit the antiquity of the human race to a few millenniums, when we allow a so much greater antiquity to the globe itself and to all the other life upon it. Human history must be on a proportionate scale. The discoveries of archaeology in the Old World now prove beyond all possible doubt that history goes back very much farther. . . .

That there was some connexion between Europe and Asia and Africa on the one hand, and America on the other, cannot be doubted. But it was in times far preceding those of ordinary history. There were times when the present distribution of land and water was not the same as it is now. Geology tells us this; and records, such as that preserved in Plato's *Timaeus*, together with the universal traditions of the Floods and Deluges, confirm the geological testimony. There was a great continent which has been called Atlantis, where now the Atlantic Ocean lies; and on this continent flourished a mighty civilization. It was the principal home of the Fourth Root Race of humanity, our Race being the Fifth Root-Race. It ran its course and passed away, transmitting its knowledge to its successors who took refuge on the new continents that sprang up as the old one went down.

The value of a due recognition of these facts about our past has a most important bearing on our future. It reveals to us the greatness of our own ancestry and shows to what heights we ourselves are destined one day to attain; for we are a later race, and though we have not yet reached so high a point in our cycle as that former race did in its, yet we shall ultimately rise higher than they did.

. . . You and I stand at this moment on the very ground where these ancient ancestors of ours stood. Our physical heredity may be European, but what of our other kinds of heredity? Whence are the Souls that inhabit our bodies, and whither went the Souls that enacted their parts in that ancient drama? Reincarnation is a universal law, applying both to individuals and to races. W. Q. Judge, the former Leader of the Theosophical Society, has said that the energy of the present American people is chiefly attributable to the fact that on this ancient soil are being reborn many of the Souls that once tenanted it before. But we have a good deal to live down before our civilization can be a worthy receptacle for the ancient spirit. That energy often takes strange forms, acting as it does through the accumulated prejudices of so much past European history. . . .

It is one of the teachings of Theosophy that there existed in ancient times a Wisdom-Religion which was once the common property of mankind all over the earth, but which, as the times degenerated, was gradually withdrawn from public knowledge and kept sacred and inviolable in the Schools of the

Mysteries or Sacred Colleges. This Wisdom-Religion, which thus afterwards became the Secret Doctrine of the Initiates, is the common origin of all religions and great philosophies. It embraced the whole science of life, including all that we now put under the separate heads of religion, science, philosophy, and so forth, and a good deal more.

But, since higher knowledge can not be attained except through purification of one's own nature, so it was necessary that candidates for this knowledge should be qualified for initiation therein. And, as the dark ages came on and men fell away from spirituality, the candidates who were qualified became fewer and the knowledge was confined to eclectic bodies.

The teachings of this ancient science were conveyed through a symbolical language, because symbols, drawn from nature, are no arbitrary signs but keys that can be understood by all whatever their race or tongue. It is these symbols which we find carved on stones and buildings all over the world, in India, Egypt, Scandinavia, America. Archaeologists are sorely puzzled to account for their identity. The astronomer Laplace was struck with amazement at the idea of the days of the week being related to the names of the deities in the same way and in the same order in ancient India as in Europe: as Wednesday, named after the Scandinavian deity Woden, which is the Roman Mercury, whence Mercredi, Miércoles, etc.; or Donnerstag, after the thunder-god Thor—Thursday—which in Latin languages becomes Jeudi and Jueves, the day of Jupiter. The symbol known as the svastika or Thor's hammer, so common an article of manufacture by the Indians and Mexicans of these coasts, is found in every country of the globe, Eastern and Western. So are the Serpent, the Cross, the symbols for water, fire, etc., etc. They are all relics of the ancient mystery-language, and serve to reveal the knowledge to some and to conceal it from others.

The hieroglyphics on the stones of Central America reveal, so far as they have been deciphered, a wonderful mathematical and astronomical knowledge, showing that the people who carved them must have studied astronomy and related sciences for enormous periods of time in order to acquire such knowledge, or else that they inherited it from a race greater than themselves. But it is not to be supposed for a moment that the astronomical key is the only key to these hieroglyphics, or that all these elaborate arrangements were made solely for the purpose of recording astronomical cycles. That is only a small part of it.

If people on this continent would only give more attention to these ancient records they would find it indisputable that our predecessors on this continent were a great and mighty people, and that the Wisdom-Religion of antiquity has had its home here as well as in the Old World. . . .

It is only by recognizing the vastness and universality of religion that we can make it fit with the expansion of modern knowledge and rescue it from the narrow grooves that sufficed for a more ignorant age. "It is an ill bird that fouls its own nest," says the proverb; and if we belittle our own ancestors, do we not belittle ourselves? It is due to our own self-respect that we should recognize the worthiness of those from whom we are descended and show a largeness of mind at least equal to the task of appreciating them. Stepping out from the complacency and self-sufficiency that have accompanied our earliest steps in knowledge, let us prepare for the knowledge to which we are heirs by studying the foundations on which we have to build.

### Portents and Prophecies

THE Law of Cycles is one of the characteristic teachings of Theosophy. It is only a more complete presentation of a law generally recognized in a partial and incomplete degree. The familiar cycles are those of day and night, the changes of the moon, and the annual cycle of the seasons. These are connected with astronomical facts.

But in addition to these there are other and larger cycles, also connected with astronomical facts, only our present system of astronomy does not comprehend these facts.

There are no finite lines or closed circles in the infinitudes of time and space. The cycles are compounded with each other, and each one begets another. The daily rotation of the earth, giving us the sidereal day, is compounded with the earth's annual revolution, giving us the mean solar day. The sidereal revolution of the moon, accomplished in 27 days and a fraction, is compounded with the year to form the lunation of  $29\frac{1}{2}$  days. The annual revolution of the earth—but here modern astronomy stops. A careful study of ancient astronomical data and methods will indicate to the thoughtful student that some of the ancient astronomers believed the apparently arbitrary and unsymmetrical cycle of the solar year to be the result of a compounding of other cycles. For they used all kinds of years: one of 12 lunations, one of 13 lunar revolutions, one of 360 days, and so on. That they knew of the true sidereal year is proved by their tables, as for instance those of the Hindûs, where it is given as 365d. 6h. 12m. 30s. We are ignorant of many of the astronomical phenomena corresponding to these cycles of theirs; but one was that of the precession, giving a period of some 26,000 years. Inside this, however, there were others.

At critical points of cycles there are marked happenings in nature. For instance we have dawn and sunset, and the seasons. To the influence of the various phases of the moon we are less sensitive and observant in these days, though many feel them. More marked phenomena occur when two or more cycles coincide. The lunations coincide with the solar year by 3 and 37, 19 and 235, 600 and 7421, and so on. This establishes a whole series of cycles, the import of which was understood by the ancient chronologers. But our observations extend over such a short period, and we allow such scanty credit to those of our predecessors, that we are lacking in data to check these cycles. Again many of the effects are not physiographical but psychic and mental.

All history is full of the records of such cyclic phenomena. In the reign of Justinian

In the fifth year of his reign, and in the month of September, a comet was seen during twenty days in the western quarter of the heavens, which shot its rays into the north (A.D. 531). Eight years afterwards (A.D. 539), while the sun was in Capricorn, another comet appeared to follow in the Sagittary; the size was gradually increasing; the head was in the east, the tail in the west, and it remained visible above forty days. The nations, who gazed with astonishment, expected wars and calamities from their baleful influence; and these expectations were abundantly fulfilled. . . .

Without assigning the cause, history will distinguish the periods in which these calamitous events have been rare or frequent, and will observe that this fever of the earth raged with uncommon vio-

lence during the reign of Justinian. Each year is marked by the repetition of earthquakes, of such duration that Constantinople has been shaken above forty days; of such extent that the shock has been communicated to the whole surface of the globe, or at least of the Roman empire. Two hundred and fifty thousand persons are said to have perished in the earthquake of Antioch. (*The Student's Gibbon*)

During this period the plague raged with terrible violence and lasted for 52 years. It is needless to enumerate other instances. In all there is the same concurrence of phenomena, physical, mental, and moral.

The ignorance of people has often led them to associate such phenomena with their own peculiar religion and to regard them as special and isolated events instead of natural and periodic ones. Snatches of archaic lore preserved in scriptures have been seized upon and interpreted as prophecies relating specially to contemporary time. Thus the world "comes to an end" periodically throughout history, and Daniel, Ezekiel, and St. John are called in as evidence. But the symbolic utterances of these writers might equally well be applied to other such cataclysmic epochs. Whether the writers alluded to any particular set of events or were describing the turning-points of cycles in general may be questioned.

In 1897 ended the first 5000 years of the Hindû *Kâli Yuga*, and the precessional cycle is supposed to have carried the equinoxes past the junction of two signs in the celestial zodiac about the same time; and H. P. Blavatsky states that other cycles changed. The foundation of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY had reference to the new age initiated by an important concurrence of cycles. The anticipation of important changes seems to be in the air. Passing over the strange unrest of Asia, and other marked signs of rapid movement among the nations, which have been commented on from time to time, we may notice particularly the crop of prophecies that is flourishing. One weather prophet says we are never again to have the same kind of weather experienced by our ancestors and those who live for another eighty years will note very great changes. Others are anxious about the stability of the Poles, or expecting that the Antarctic ice-cap will melt. While most of these ideas are as wild as those we read of among the superstitious of past times, their prevalence indicates a general sense of something impending.

STUDENT

### History in Words

SOME of our mercantile terms have interesting sources. The word "bankrupt" carries us back to the Italian money markets, in the days when the usurers sat at their benches in the market with the money for loan displayed before them. When such a merchant failed to meet his obligations, it was the custom amongst his associates to break his bench in token that he had forfeited the right to conduct business. His bench was called "banco," and in the case of such disaster he was called "bancorotto," a "broken-bench." When the Lombards came to London and introduced their business (even now Lombard Street is one of the great business centers of the city), the term bankrupt came with them, although there is no evidence that the custom of the broken bench became naturalized in England. And the humble Florentine or Lom-

bard bench is now the dignified "bank," scarcely changed in name from the original "banco."

The word "dollar" is the German "thaler," but its connexion with a valley, which is the literal significance of the word *thal*, dates back to the fifteenth century. The Counts of Schlick coined ounces of silver from the mines at Joachimsthal (Joachim's valley) of such purity and weight that they became standard coins. Other coins made in imitation of them were called merely thalers (or dollars), to distinguish them from the Joachim thalers.

The importance of agriculture in the original Roman system of civilization is illustrated by the word *pecunia* for money (*cf.* the English *pecuniary*). The possessor of many cattle (*pecus*) was a rich man, and money only represented his herds to him. It may be that many a large rancher now reckons his cattle as so much money, just as the old Roman ranchers once did.

Although no picture of historic word-migration, or of anthropologic interest is involved in the word, the familiar "rupee" recalls the term "rûpa," from the form of a man said to be impressed on the coins first called by that name.

Some day far distant from this the civilizations of South America will find archaeological interest in the "sols" of Peru, the Bolivar of Venezuela, the Sucre of Bolivia, and in the other coins named after the national heroes of the Liberation. P. A. M.

### American Speech

NOW it is no less an authority than Dr. Skeat, Professor of Anglo-Saxon at Cambridge University, who adds his testimony to that of Dr. Alois Brandt of Berlin, on the subject of the excellence of English as it is spoken on this side of the Atlantic. One of the reasons which he gives is that more attention is paid in this country to the teaching of the language than in England, where the great schools are taken up with Latin and Greek as of primary importance. It was to the pupils turned out by these institutions that a character in one of Mr. Bernard Shaw's plays referred when he said that "few Greek scholars know Greek, and none of them know anything else."

To what extent this devotion to the Classics, or neglect of phonetics, is the cause of English ignorance of English speech, the fact remains that in the United States there is no such diversity of accent, to say nothing of dialect, as exists in Great Britain.

Anybody who has traveled much in Ireland, if he has a quick ear, will be able to decide at once what county a stranger came from. In the case of Scotland, it is notorious that neighboring cities like Glasgow and Edinburgh have distinct and unmistakable peculiarities of speech. On the other side of the Tweed there are more dialects than religious sects. A Yorkshireman may be quite incomprehensible to a native of Lancashire, a Lancashire man to an inhabitant of Dorsetshire, and the last to a Cockney. On the other hand, while many of our immigrants from the continent of Europe speak English badly, that is the only complication. The mass of the school children use the language in pretty much the same way everywhere.

The Scots may be proud of their Doric dialect as they are fond of calling it. But, in spite of Burns himself, we may well be glad that the business of life is subject to no such complication in this part of our continent. The Habitant dialect in Canada, while not without its fascination, is a hybrid that has resulted from the effort of two distinct races with different tongues to get along together.—*Evening Sun* (New York), May 10, 1908

## Welsh Literature—Prose—Fifth Article

### THE ROMANCES IN THE RED BOOK OF HERGEST

#### 1. THE MABINOGION

THE chief prose work of Wales is the romances contained in the Red Book of Hergest, which comprise the Mabinogion in Lady Charlotte Guest's translation. These stories may be divided into three classes, to only one of which the name Mabinogion rightly applies. These three classes are: First, the "Four Branches of the Mabinogi," the Mabinogion proper (the suffix *on* denoting the plural). These were tales sacred of old to the Sun-god Mabon (Apollo Maponos of the Gauls), knowledge of which was a part of the equipment of members of the Bardic Schools; second, Arthurian stories; and third, certain old tales which are not rightly to be classified under either of these heads.

The Four Branches are the stories of Pwyll the prince of Dyfed, Branwen the daughter of Llyr, Manawyddan the son of Llyr and Math the son of Mathonwy. The first three of these belong to what is called the Dimetian or Southern Cycle, the last to the Venedotian or Northern, their heroes or setting being of the south and north of Wales respectively. The flavor of these tales is altogether pagan and noble; they do not tell of woad-stained savages or wicker cages aflame, filled with human beings; but they do tell of a race that went hand in hand with the spirit of nature; of men who fed their souls with the sense of the ever-presence of nature's marvels, her glamor, her enormous and fairy wealth; a race by whom

Out of the depths of the seas,  
Out of the hearts of the mountains,  
Out of the waves on the rivers  
Some God is always to be expected, bearing  
rich gifts for the good man.

There are but few allusions to Christianity in these tales, or indeed, in any of the collection; and such as there are prove nothing but that they crept in or were inserted in and after Christian times. Manawyddan had captured a mouse of the enchanted army of mice that ravaged his fields; she was in reality the wife of Llwyd ap Cilcoed the magician, who

appeared to Manawyddan in three different guises to rescue her; first he came as a clerk, then as a priest, lastly as a bishop; we may safely assume that in earlier editions or versions he appeared first as an ovate, then as a bard, then as a Druid. Also such phrases occur as "*Myn fy nghyffes i Dduw*,"—"by my confession to God," which all need no more accounting for than by saying what

one of the three fortunate concealments of the Island—since, while it should remain there, Britain was to be preserved from all oppression by foreign foes and invaders.

Oh, wonderful tale of the feast at Gwalas in Penfro, where they came into the hall, and it seemed to every one of them that what the Wonderful Head had said was true, and that from the time the sea and the sky and the old palace were made, no one had ever opened the door that looked out towards Aberhenfelin and Cernyw! There were in the hall at Gwalas three doors; one looked westward toward Ireland, and through that they went in; one looked eastward toward Wales, through that in their time they would be going out; and these two were wide open. Then there was that third and shut one, and the fate of the Island of the Mighty rested on whether they could stay during the Wonderful Head's pleasure, leaving it shut as it had been from the beginning of time. Heilyn ap Gwyn Hen failed: after eighty years that went by them, they could not have told that more than a single day had passed. "Evil fall upon my beard," said he, "unless I open now that door." He did, and old age came upon them all, and ruin upon the world-old palace-place of Gwalas, and the life was gone from the Wonderful Head.

History, not invention; true, every word of it, as all old sacred tales are; and bearing relation to the history of mankind and to the individual history of each of us, or to some stage of it. Here truly is

that most ancient drama which

Hath in it life and death and fate,  
And what dwells under night and day;  
Which God for countless ages sate  
To watch his countless angels play.

(To be continued) A WELSH STUDENT

NO MAN is made happy by the mere possession of objects. The measure of our desires is the measure of our slavery. Only by an acquirement of the Science of Life can happiness come, and only the true philosophy of life can make man master of the world and of himself.—Katherine Tingley

Lomaland Photo. and Engraving Dept.

HERAKLES AND LICHAS—TORLONIA MUSEUM, ROME

we well know to be the fact, that the Red Book of Hergest was written in the Twelfth or Eleventh century. But it is pagan gods and heroes that ride through these pages. Here are the Doniaid, divine race of the Children of Goddess Don; here are Arawn, king of the Underworld, and the Wonderful Head, which, although bodiless, was full of life and able to give teaching and instruction to the seven who brought it from Iwerddon into the Island of the Mighty. Its death or silencing was because of the disobedience of one of those seven, and its burial in the White Hill in London, with the face towards France, was

IT is an old simile, the likening of one who enters the Path and in actual honesty battles to better his life, to a diver plunging down into ocean's depths. The usual interpretation considers the ocean as symbolic of the vast ocean of wisdom, but here let us consider it for a moment as symbolizing the almost fathomless deep of his own nature, into which the Student plunges. Bravely he may do it or warily, but plunge he must. There are pearls to be found there, of a surety, but also other things, many of them astoundingly enormous and savage and which may even stir up the whole ocean in their first wild anger at being disturbed. They are the old old "enemies within the household," which the Student, once he has roused them to the fighting point, must lay low, and that speedily, or be laid low by them. We all know them, or some of them: fear in all its guises, ambition, pessimism, appetite and desire in few or many of their myriad forms, and so on.

The Student "who has come prepared" is armed and ready for them and, if he does not purpose to be driven from the field, in no long time he comes off victorious. Not all the enemies in this vast ocean of human nature—and his own nature, though but the drop in that vast ocean, yet partakes in every tone and color and atom of the being and essence of the whole—not all are defeated in this onslaught. Only the more robustious ones at first put in an appearance; or rather, only the more evident and easily excited parts of *It* make themselves felt, for the evil is after all *one*, one frightful thing only, of which the different passions we fight as they crawl out trying to strangle us are only tentacles.

Considerable has been gained at the first siege, and it will stay gained if we do not galvanize all these severed tentacles into another—and for a time apparently fiercer—life by negligence and conceit. Some do this and herein lies the explanation of why certain

## "That Injured Feeling"

Students seem to be no more than out of trouble with themselves when they are forced into the same battles again. They couldn't resist the temptation to plume themselves a little over their "victories"—others might not rise to the point of appreciation, you know,

THEOSOPHY teaches the divinity of man and that consequently through a realization of this teaching man himself can change all the bad conditions in the world which have arisen from humanity's having turned its interests and aspirations from high and divine things to those which are connected with the lower nature. Theosophy can remove from humanity all hate, jealousy and selfishness because it has the power to call forth the feeling of that great unity that lies hidden in the depths of the hearts of all men. Theosophy also has the power to eliminate fear, one of the greatest evils of our time, because it teaches that the divine in us is the essential, and that what happens to us should concern us only in so far as it makes us feel nearer to, or further from, the consciousness of our divine nature.—*Katherine Tingley* in a lecture given in Sweden in 1907

if they did not—or they did not learn compassion in the struggle, and so missed the real use of it, or for other reasons. This is the case with everyone who does miss the real use of his struggles, which is to give us sympathy, genuine sympathy, for others. This should not be, and need not be, for the Law means our progress to be progress, not a traveling round and round the wheel of a squirrel's cage.

Many of us do, however, waste valuable time every year we live, every day even, in the squirrel's cage process, and one favorite method with a certain type of Student—often a sensitive and fine type—is the cultivation of what may be termed "that injured feeling." We have done valiantly, the enemies in our

households are conquered (we think), we have wonderfully purified our natures (we think), we have attained heights far above those on which we stood a year, five years, or ten years ago (we think). And things ought to be going to suit us pretty soon (we also think). But alas! they do not. We see someone whose faults (to us) seem obnoxious as a hedgehog's quills, enjoying advantages which we had by that time and very reasonably (!) expected would be ours. We let some inside disappointment seize hold of us (although we should be highly indignant if anyone were to hint that perhaps we had been working all these years for reward) and before we know it "that abused feeling" has settled down upon us and hugged us tight in its thousand soft and slimy arms.

Some Students are so fortunate as to have the trust and sunshine in their natures that enables them to escape this experience. But those with a touch of pessimism, even though unsuspected, those who did not at the very start *absolutely purify their motives*, have to have their little experience with the octopus mentioned. Some waken with a start when they feel the hideous enfoldment of the creature and, summoning all their will, all the light and strength of their souls, free themselves speedily. Occasional ones settle down with a sigh that "it is my Karma" and do not waken until the misery has been a prolonged one. A few seem to want to postpone the awakening indefinitely.

But the change in the natures of those who are thus horribly enfolded! They wear the sign of it in every move, every word, every act. There are those who can read it. If you cannot, it simply means that there are some experiences you have not yet had, conquests you have not yet made. It shows itself in a thousand ways, such as an absorbing interest in other people's affairs—"curiosity" we usually call it, but curiosity is only one of the tentacles of the Thing; in a dead-set pessi-

mism, however concealed — another tentacle; in those little fretful anxieties and demonstrations which write "jealousy" — tentacle number three; in a tendency to criticise others while very complacent about oneself; in a tendency, even eagerness, to pick flaws in others even to the point of persecution, and so on — all tentacles of *It*, every one. And the whole cause is a letting something wind itself around the nature that is the opposite of trust. We may shout trust and loyalty to the skies, day in and day out, but these little signs of "that abused feeling" are absolute proofs — to those "who can read the mysteries in the human face" — that trust is not there.

What is to be done? Let us first get down to the heart of our motives and settle, once for all, the question of what we entered the Path for, of whether it is to be trodden "for its own sake or for the sake of our feet that shall tread it." Next, let us get down into the heart of our duties and search out our motives for doing them. It often helps to go back to some of those precious ancient writings that but for H. P. Blavatsky would be sealed and unknown to the West today. One need not enumerate them, all are so precious, so wise, so wonderful, and the doors of the heart open to let honesty walk in when we read the priceless, simple, yet to the world at large, veiled words, words that could give us the very core and essence, the very uttermost secret, of the Râja Yoga system of education *if we could read with full understanding*. How the mind reaches to steadiness when an effort is made to follow the laws there laid down — the laws enjoining sympathy for others, dispassion, disinterestedness, benevolence, tenderness and true concentration.

But this will not do it alone, nor will works, nor faith. It takes will-power. We must make an effort, and we shall never have the wit to do it, nor the courage either, until we face ourselves squarely and flatly repudiate the dishonesty in our own hearts. For dishonesty is there in the case of everyone who permits periodical visitations of this octopus, or "that injured feeling," which when chronic, as it is certain to become if allowed to remain, means that we are in its clutch right along.

Dishonesty? Yes — we are dishonest when we preach "Karma" and then practise a perennial whine. Supposing we cannot see the reasons for so-called unpleasant things. We are equally blind as to the causes of what we call pleasant (which word very often stands for what will feed our self-esteem or our am-

bition, by the way). Yet the latter calls forth no complaint and usually, alas! no gratitude. Must we have proof that the Law is just? We need not travel backward through the mazes of ten incarnations to find it. Let us weigh and observe with care, with reverent, loving discrimination, with earnestness and tenderness and trust, the events of *but one day in our own or our fellow-workers' lives* — we shall have all the proofs we will ever need of the Divine Justice of the Law, of an actual abiding, regnant Presence, moving among us to guide, protect and save.

What is this thing that makes us rebellious, discontented, critical, jealous, fretful, "abused"? Trace it to its source. There it is at last — some desire that but for the very things we rebel so against would probably

be capable of gratitude, ready for joy, and worthy of an atmosphere of peace. STUDENT

### Jottings and Doings

(From a Student's Note Book)

MRS. ELIZABETH GOODNOW, whose husband was for nine years United States consul at Shanghai, China, is now working actively among the poor on the East Side of New York City. Her observations anent missionary work in China are of special interest because she was so many years on the ground, having gone there in full sympathy with it. She says:

After nine years of observation of missionary work in China, I am convinced that I can do more good among the poor of New York than I could in China. I cannot give you a very good opinion of the American missionary workers in China. Of

Lomaland Photo. and Engraving Dept.

INNER COURTS OF THE NIZAM'S PALACE, HAIDERABAD, INDIA

drag us to perdition. What evidence can we find that the very circumstances that so conspire to make us think we are "abused" are not divinest, tenderest of safeguards thrown about us in sheer mercy by the Law? None of us can know what seeds of cruelty, love of power, egotism, vanity, indolence, sensuality or treachery may be lying dormant at the base of our natures ready to sprout and grow at the first sign of favoring conditions. God pity us if we think we do. And how plain all this is in higher moments, those rare times when we can rise to the point of daring to look ourselves in the face, of daring to admit to our own souls that we are not perfect, nor even, perhaps, very near it. That is what lets the light in, and trust in, and honesty in, and when these stand back of the will "that injured feeling" will have to go, tentacles and all. When we have finally pitched even its ghastly memory out of the window we will

course, there are some who are doing good work, but as a rule they are a little, narrow-minded lot, and I do not blame the Chinese for often looking down upon them. Their ideas of Christianity would never be accepted by our people and it is little wonder to those who observe their methods from close range that they make no greater headway than they do among a people *so advanced in religious thought as the Chinese are*.

ST. PETERSBURG, June 22.—Czar Nicholas today promulgated one of the most sweeping measures ever issued in Russia, by which all women students are ordered expelled from Russian universities.

The order affects 2200 women, many of whom are nearing graduation, and the bitterness is widespread.

The Czar issued instructions to Minister von Kauffman, chief of the bureau of public instruction. These orders set forth that henceforth no women shall be admitted to any university.

It is announced that the action is the result of activity on the part of women students in revolutionary movements.—Los Angeles Examiner

# OUR YOUNG FOLK

## Râja Yoga in Santiago de Cuba

THE following press notices, translated from Cuban journals, show how the appreciation of Katherine Tingley's work for Cuba is growing in Santiago de Cuba.

### STUDENT

ACCORDING to announcement for last night and in spite of the bad weather, the reception was held at the Râja Yoga Academy. The program was as follows:

March		Zimmerman
	ORCHESTRA	
Class Work by the Tots		
Waltz	"Barcarolle"	
	RÂJA YOGA GLEE CLUB	
Violin Solo	"Berceuse"	Ehrhardt
	ENRIQUE COLUMBIÉ	
Piano Duet		Streabbog
	ANGELITA PLANOS AND JOSEFA ROVIRA	
Piano Duet		D. Aubel
	EMILIA MOYA AND ANGELITA PLANOS	
Song	"Good Morning"	Spaulding
	GENERAL CHORUS	
Class Work by Little Boys		
Military Drills		
INTERMISSION		
"The Awakening of the Flowers"		
Maypole Dance		
Tableau	"San Juan"	

All parts of the program were received with great applause by the very large audience present. We congratulate the directors of the school who have won such a noble standing for its name.—*La Prensa*, June 5, 1908

LAST night the Râja Yoga Academy gave a concert at the close of the school year. It was attended by a large number of people and was highly successful.

For Thursday evening is announced another children's *fiesta* to be given as a reception to some distinguished English guests who desire to learn something of the attainments of the children of Cuba.—*El Oriental*, June 2, 1908

THE pupils, both of the Râja Yoga Academy and the Free School, gave a special *fiesta* in honor of some distinguished guests who came from London purposely to learn something of Cuba and the Cuban people. Mr. Raleigh Phillpotts is a lawyer in the great metropolis. He is accompanied by his wife. The Directress of the Academy, a friend of these distinguished guests, wished to present to them the Cuban people in the persons of the children of the school, in order that by thus seeing a number of them they might judge of the rest.

The children who took part called forth repeated applause, and once more demonstrated the efficiency of the system of teaching in the institution and the vivacity and natural intelligence of the Cuban child.

We do not know what will be the impression of Cuba and the Cubans which Mr. Phillpotts will communicate to his friend, Lord Lucas, but we venture to affirm that the children whom he saw, as representatives of the best, have demonstrated to him that Cuba, with all her defects, has a brilliant future before her because of such children.

The military drills and exercises are a real pleasure to the children who are educated by the Râja Yoga system. If all the public schools of Cuba would educate in the same manner, within a few years we should have a generation of men and wo-

men who would make it impossible for us to envy any other country in the world.—*El Oriental*, June 8, 1908.

THE inclemency of the weather did not prove an obstacle to the Râja Yoga Academy last night in giving a delightful reception to Mr. and Mrs. Raleigh Phillpotts. The well arranged program was rendered with charming taste, in all its details. The music was exceptionally good, and all the exercises were executed with the highest degree of ability and dexterity.

Râja Yoga is indefatigable in its great work of instructing the Cuban youth.—*La Independencia*, June 5, 1908.

At the Râja Yoga Academy, the work of which is carried on with such brilliant success in this city, there was held last night a grand reception at which were present many of the most distinguished society families of Santiago, to meet Mr. and Mrs. Raleigh Phillpotts who came from London to visit the Directress of the Academy, Miss Herbert.

The boys of the Free School connected with the Academy carefully gave a select program, notably speeches upon subjects suggested to them, music, and military drills, in addition to that rendered by the Academy pupils—which included musical numbers on the piano and other instruments and by the orchestra, tableaux and drills; all demon-

strating what excellent instruction the children receive from their teachers.

The distinguished guests were highly entertained. The large assembly was afterwards served with ices, coffee and cake.

In reiterating our cordial welcome to Mr. and Mrs. Phillpotts, we take pleasure also in congratulating the teachers of the Râja Yoga Institute on the new triumph won by them.—*El Cubano Libre*, June 5, 1908.

## Râja Yoga for Cubans in Lomaland

THE cut on this page pictures well what Râja Yoga in Lomaland has been doing for the large group of Cuban boys and girls who have been pupils at the Râja Yoga Academy at Point Loma for several years. Standing amid wreaths and garlands, beside the flag of their country which they have here been learning to serve with the Higher Patriotism, and the harp which symbolizes the world of music opened to every one of them by the training they have had, they present the promise of a glorious future for Cuba. The coming years will prove that Râja Yoga has awakened in their young hearts the desire to serve nobly and help to uplift humanity. G.

# THE MYSTERIES OF THE HEART DOCTRINE

Prepared by  
**KATHERINE TINGLEY**  
AND HER PUPILS

*The Theosophical  
book of the  
Twentieth century*

Tells the story and the history of the  
Theosophical Movement.

The prices are \$2 in cloth and \$1.25 in  
paper, which barely cover the cost, for it is  
printed and bound, not gaudily, but with  
such carefulness and thoroughness of art  
and craft as to make it unique among  
modern edition books.

Order now from  
**THE THEOSOPHICAL PUBLISHING COMPANY**  
POINT LOMA, CAL.

**Isis Conservatory of Music  
OF THE UNIVERSAL BROTHERHOOD  
AND THEOSOPHICAL SOCIETY**  
POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday  
by the Secretary at SAN DIEGO BRANCH

**ISIS HALL, 1120 FIFTH STREET**

between the hours of 9 A. M. and 4 P. M. Full particu-  
lars will be sent by mail upon application to

**J. H. FUSSELL, Secretary and Treasurer,**  
*Isis Conservatory of Music,*  
Point Loma, California.

**SOME OF THE ERRORS OF CHRISTIAN  
SCIENCE  
CRITICISM**

by H. P. Blavatsky and William Q. Judge

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"  
A Note of Warning

— by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

— by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy  
there is given no adequate explanation of the healing  
that is at times accomplished, nor of its *rationale*,  
nor of the ultimate price that must be paid and the  
dangers connected with such practices.

This pamphlet is invaluable to all students.

Price - 15 cents

### Christianity's Mistake

being asked by a reporter concerning the vitality of Christianity here, said:

There is, I am sorry to say, a tremendous ebb in church-going. . . . The great bulk of the people do not trouble about the churches at all. . . . If you put in a Sunday morning at an average church in Boston or New York, you would be painfully struck by the evidences that the church has lost its hold of the people. . . . It seems to me it is just this—that the church is itself out of heart, it is apathetic, it is unimaginative, it does not seem to have energy either to think or to act, and it does not see either the exigencies or the opportunities of the situation.

Professor Foster, of the Divinity School of the University of Chicago, recently wrote:

In my opinion, Christianity is in the most grievous crisis of its history. . . . It is the dying of the old faith which Christianity is witnessing.

### The Activity of Impending Dissolution

The activity of the churches and their apparent prosperity, according to him, are only throes which precede dissolution.

These quotations represent the general opinion of those whose knowledge qualifies them to speak. And, if Christians, they must hold that the age is morally deteriorating. For if it is morally advancing whilst Christianity is losing its hold, it follows that Christianity is unnecessary and could not, therefore, have had a divine origin.

So it is deteriorating. Is this due to loss of Christianity? Then Christianity showed itself incompetent to keep its hold, was an imperfect prescription, and again, therefore, not divine. If the other way round, Christianity showed its incompetence and non-divinity in failing to prevent the deterioration which led to its own loss of hold.

Christianity, then, in its present form, appears to be self-admittedly a failure. Would it not be well for its believers to face the demonstration of facts and make some inquiries? It has had sixty generations in which to train men's minds; and the minds so trained have decided to reject it. To urge that it has been supplanted by false and materialistic teachings is useless. Why was it so weak as to be supplantable?

The religious streams which converged to the point of origin of Christianity, taught, one and all, in various terminologies, that the soul

in man was of a higher and diviner nature than his lower reasoning mind; that it was capable of uniting itself with, and knowing, Deity; and that in so doing it passed from merely elevated and aspiring feeling into *actual knowledge*. Christianity later on, took great care to cut itself off from all these streams, to disavow any connexion with them, and to make its teaching as different as possible. This it could do, and did, in the most effective manner, by dropping the soul without dropping the name of it; by teaching of it, not as a divine ray whose natural home and origin was the divine world, and whose natural function was knowledge concerning that on which men have since had to speculate or grope for in uncomprehending faith, but as some undefined thing which itself needed help and salvation; in a word, by teaching away man's divinity and dignity.

But the real teaching would not die so easily. For nearly six hundred years it kept cropping up in the various forms of Gnosticism and Neo-Platonism—only to be steadily suppressed and voted heresy. Man should not be, must not be, is not, innately divine; he must not, cannot, have knowledge, power of self-redemption through his own soul.

And so at last, by dint of time—forty, fifty generations—mind took the mold required and ceased to recognize soul as a veritable power and potentially redeeming light. It closed itself in—which meant materialism. The *Soul* did not atrophy; that which atrophied was the channel from soul to mind.

Theosophy teaches, and will in due course prove, that that part of Jesus' *teachings* which dealt with the soul as a knowing power, a very part of Deity, was deliberately suppressed—along with much else that would have left him standing *where he intended to stand, i. e., in*

the line of, one of, the world's endless series of spiritual teachers. For religion is a golden cord which has been in the world and has never broken since the beginning of ages. Each time that religion begins to fail, each time that men begin to let this cord drop into the mire, a Teacher has picked it up, restored it to men's view, shown them once more that it is their guide to real life and joy. It does not drop, never has dropped, because men lose interest in it, but because they are designedly misled and deceived. Spiritual ambition is and always has been the enemy of Religion. There have always been those who tried to hide from man his own powers because *they* wanted the throne in his heart that belongs only to

### Emancipating Teachings Suppressed

his soul and its source. The origination of Christianity was their opportunity, and they used it. The present teachers of Christianity are under the same curse as their hearers. They too have been, through the ages of teaching, teaching stamped by hereditary transmission, deprived of true and effective knowledge of their own souls. They have no tongues of fire. Christianity has now no teaching to offer, because it threw the teaching overboard as soon as its journey down the centuries began. And so Theosophy has come to restore to Christianity what it has lost, the message to man that he can know what and as the gods know, that if he will awake himself to the presence of his own soul he can indeed become a god. "Know ye not that ye are gods . . . ?" STUDENT

**The Soul's  
Keys Lost  
— or Stolen**

**The Science of History**

HISTORY was a curious record less than a century ago. History is a curious record now. Stretched on the theological Procrustes' bed of an absurd creation theory, it has even now scarcely begun to stir its stiffened limbs and take its rightful place among the sciences. But like other sciences which seemed definitely fossilized, history found new and unexpected life infused into it by systems of investigation which had lain idle in the rubbish heap among the other unrecognized keystones of the structure of human experience. The higher criticism played with a dazzling searchlight on dogmatic formulae and the literal acceptance of foreign ideas done into unfamiliar words. The probe of comparative philology began to suggest disquieting doubts of ironbound ecclesiastical infallibility and want of elasticity. Archaeological research began to reveal a long list of anticipated "modern" ideas which threatens to leave us very little credit for originality and progress outside the negative honor of restoring the grandeur of former times, great as our achievements may be on the utilitarian plane. Geological evidences began to demand attention as legitimate proofs of the necessity for the measurement of the earth's age by millions of years instead of a few thousands. Gradually the way was prepared for the astounding revelation that there are living organizations possessing actual records of the world's history for untold ages. Gathering the threads together, adjusting, enlarging, suggesting, collating, and bridging the gaps, H. P. Blavatsky found the world scarcely prepared for even this preliminary work. Even now the time has not come to make public more than the few generalities that will be of value in the present transition age. It is humiliating, without doubt, to feel that our civilization in the west can by anyone be regarded as not sufficiently far advanced to be trusted with much more knowledge than we have or think we have, and one is naturally inclined to deride the possibility of such an immense store of knowledge being in anyone's possession — but it is not for such that these records of past history, human, scientific, philosophical, have been preserved. The church deriding Galileo and condemning his philosophy is all that is needed to show the futility of trying to give knowledge to people who are ignorant enough to "know it all," and to set limits to it.

A moment's unbiased thought will show that if in the light of such a picture any person or body possessing knowledge beyond the ordinary were to attempt to spread such knowledge he is rashly venturing where he is not wanted and his knowledge is deficient of common discretion, unless he has so vast a purpose and so unselfish a character that he is willing to be crucified for the sake of helping the few earnest seekers along the path of human progress. This alone gives ample reason for the strange fact that secret bodies of worthy men have of recent years been found to have a very real existence and a very real purpose and a very real knowledge. Freemasons, Rosicrucians, Alchemists, Druses, Druids, Medicine men, Maori chiefs, Kabbalists, some Shintoists, some Buddhists, Sufis, and many, many others are slowly coming to be recognized as not mere visionaries but all representatives of a body of knowledge which may be called the larger history of mankind. True, some have it so crystallized that it needs much digesting and distilling and refining to make it once more a living power in the life of humanity — but the main fact is that it is there, and among a sufficient quorum is pure and active and vigorous, immune from all tampering with its ancient landmarks. If there are visionaries among these bodies, if there are some unworthy among their ranks, if there are some who themselves least suspect what the grand mission of their order may be, that is their misfortune; and yet possibly they may help more than they are aware by forming an outer shell to protect the real workers in their center, by distracting hostile attention, and in other ways.

Link by link the chain of history is being forged anew, and when the world has the picture complete, who can doubt that history will be identified with that vast body of knowledge which various in its aspects, in its totality is the Theosophy that shall lead men consciously to realize that the purpose of humanity is one, though it may have facets innumerable. With all history spread out in due proportion before him, surely it is not too much to expect that the divine purpose will in part be revealed to the seeker for truth. And also it will doubtless appear why some have ever tried to dwarf, to distort, and deny, while those who held the keys waited in silence, lest they should furnish one more weapon for the enemies of human progress by revealing secrets which the moral stability of the race was not sufficiently strong to insure against misuse. It is among thoughts such as these that we find the answer to the wondering question: "Why should geography, history, chemistry, mathematics and such every-day sciences have been in times of old strictly preserved in the secrecy of the temples, unless the schools of antiquity were merely bodies of selfish seekers after the power of knowledge?"

The subject is vast in its scope, and deep as they are, *Isis Unveiled* and *The Secret Doctrine* have but pointed out the landmarks. To one interested in the subject it is interesting to read these works at intervals of several years and to compare notes with the changing and growing theories and discoveries of modern authorities. Students of these works cannot but realize that those who point out the landmarks can also show the way, and they do! M.

**The Awakening of Asia**

THE Western peoples, says a contemporary, will soon be obliged to change their ideas of the Eastern world; for where-as they have been long accustomed to regard it as a land plunged in eternal sleep and indifference, late events show that it has not lost the power to awake and rub its eyes. One rarely sees a telegram from any part of it that does not tell of some upheaval. There is the rise of Japan, the stirring of China, unrest in India. In Indo-China the French officials are haunted by the possibility of a vast popular insurrection. In Afghanistan the warlike clans seem meditating a descent upon the fertile plains below them. One motive for the rapid completion of the Russian railways to the East is believed to be the fear that the Khanates are hoping to get rid of the Russian control. In Persia the people are filled with the Western desire for representative government. In Turkey the martial caste is protesting against tyranny military and sacerdotal.

What, is asked, has thrown so many and such quiescent peoples into an inexplicable fever of agitation? "It is as inexplicable as the sudden movement against polygamy which is said to be affecting the entire female world of Islām." An Anglo-Indian official was startled to find that in Kashmir and in the huge valley of the Brahmaputra every Japanese victory was welcomed by an illumination.

The same kind of thing has happened before in history. Sleep does not mean death, nor long quiescence eternal rest. Recently several important epochs in the natural chronological cycles have been reached. One was the closing of the first 5000 years of the Hindu *Kali Yuga* or Black Age, which took place, according to their reckoning, in 1897; and there are other cycles which turned about the same time. Since then this universal upheaval in the East has been growing more and more marked. Clearly the world has begun a new epoch, a new day; we see the signs of reviving activity everywhere. Old ideas seem as things of yesterday, and new ideas are springing up in their place. The change is as yet only in its incipient stage; what will happen when it acquires momentum? We have also had a few minor cataclysms and doubtless more may be expected; for such cyclic changes are always accompanied by corresponding readjustment in the physical earth.

Many cranks, scenting these changes, try to reduce them all to terms of the Biblical *Book of Daniel*, or some other interpretation. But they are merely regularly recurring events in the world's history. The world has often thus "come to an end" before.

We cannot trace by external observation the causes of such a general upheaval of the human mind; for the causes are interior. There is an outpouring of the "Spirit," not by special favor of Jehovah, or any other special deity, but merely as part of the natural life of that great being Humanity, whose lifetime is on so much larger a scale than that of the units composing it. Humanity wakes and sleeps, has its summers and winters.

The expansion of human nature, due to this influx of the Spirit from within, is seen in the impulse towards broad and lofty ideals of fraternity, freedom, and knowledge. Life is quickened and the forces, alike of evil and good, are gathering to a head. STUDENT

# Some Views on XXth Century Problems

## Vocal Melody

A CONTEMPORARY has been asking its readers to give the lines of poetry that to them appear most musical, and a large number of quotations have resulted. A few contributors have speculated a little upon the cause of the melody, but they generally regard it as mysterious and unfathomable.

Is it so? There may be a mysterious element, but this lies altogether further back. The cause of the melody does not seem at all insoluble.

In the first place one must rule out lines which though of fine and perhaps extremely poetic sentiment, are not melodious. In another journal, conducting a similar discussion, a priest offers as fine lines:

He breaks the power of cancelled sin  
And sets the prisoner free.

Clearly, it was the doctrinal sentiment that was obtaining his approval.

Then again, there are lines which, though not really melodious, or only partly so, derive their seeming melody from their containment of words that are full of richly poetic association, heavy with clouds of half-defined meaning, words like the rooms of an old and haunted house. These lines of Keats' have much of this apparent melody and also some real:

Magic casements opening on the foam  
Of perilous seas in faery lands forlorn.

As well as the haunted words and the actual melody, these lines as a whole raise up strange dreamy pictures, reminiscences of old romance, and formless memories whose source we cannot find. But neither the first nor the last of the three elements will help in the stricter search.

Here are some lines of Tennyson's in which pure and unbroken melody takes first place:

The moan of doves in immemorial elms,  
And murmuring of innumerable bees.

and:

The mellow ouzel fluted in the elm.

Does not the melody consist, first in the long slow open vowels, and second, in the use of fluid consonants, consonants which are half vowels in that they permit the voice to go on unbroken? L, m, s, f, and v, with one or two others do not break the tone.

Our reading of poetry is vocal; it is either actually so, or we hear in imagined reproduction our own or some other voice. Well then, the long vowels and the gliding consonants give the voice the chance of the expression of long unbroken strands of feeling; and in that, it would seem, lies the melody. In verse broken by sharp consonants which for a moment utterly stop the vowel tone, the expression of the flow of feeling is broken—which means that the feeling itself is broken, jarred to pieces. But even then the verse may be melodious, in degree, if the feeling belonging to it is very simple, elemental, and such as would naturally find expression in short bursts.

Some verses bring the voice to a pause in-

tionally in order to get the effect of *silence*. But it is a full silence, which the imagination bridges with continued sound. The melody is broken and it is not. Such a pause occurs at the end of the first of these two lines:

For old unhappy far-off things,  
And battles long ago.

Between the first and second lines is a space which the mind will fill with formless thought and unheard tone, making its own melody.

The real secret of the melody, then, is in the soul of the reader, and this melody of consciousness, of feeling, will find its way into the lines if they permit. Lines which permit, and are rhythmical, are melodious. And their permission lies in their unbroken sound flow. A very fine and cultured reader may sometimes make unmelodious lines melodious by prolonging the boxed-up vowels and smoothing away the angular consonants. STUDENT

## The Army of Suicides

A POPULAR contemporary publishes the recent suicide list for this country and for Europe. As regards ourselves, there are now about eleven times as many persons per million who take their own lives as in 1881. The rate was 12 per million in the earlier year; 126 per million in 1907. If this rate of increase persists—and why should it not?—during the next five years about as many will thus perish as during the five years of our civil war. In Europe the increase is also very marked, amounting now to about 70,000 a year, perhaps the deathrate of a year of a great war.

Discussions of the causes of suicide usually reach nowhere. It does not help us to know that they are more frequent in June or on Monday or on fine days, or that the favorite method is this or that. Monday occurs no more often south of the sixtieth parallel of latitude than north of it, and suicide does. The real cause can usually be found by the average reader in himself. What will he do when he has read the article with its figures? *Read the next one!* Neither his imagination nor his heart has been touched by that silent, suffering army of unfortunates despairingly leaping into the dark gulf. There was never a suicide in *his* family, thank God!

But part of his indifference is of a little nobler hue. He really knows not what to be at in the matter, and in self-defense shuts it out of his thought.

In another of the magazines there is a short story differing from most short stories in being worth reading. It is of an over-worked, underpaid doctor living in the densest part of a great city. His patients, mostly gratuitous, have learned to look to him not only as their doctor but as their ever ready friend and helper and adviser. A chance suddenly offers itself to him for removal to the country, to fields, flowers, streams, lighter work, congenial society. As he is thinking it all over, he is called to the bedside of a poor woman and has to stay all night fighting death. But by the time he returns home in the silent early morn-

ing, utterly wearied out, he has solved his problem. His duty is with the people whom he can help, whose difficulties he can lighten a little. He decides to pay his life into the common life instead of holding it back for his own.

Suicides are increasing because there are fewer and fewer who even think of paying their lives in for and to the general life. The atmosphere is getting ever colder, wrapping the lonely and despairing ever closer into their loneliness and despair. Every purely selfish or self-limited thought and deed makes it colder. It is probably nowise too much to say that every *unselfish* thought and deed, winging its unseen way, stops a suicide somewhere from his leap to the gulf. STUDENT

## Born Hypnotized

A DOCTOR writes to one of the medical journals lamenting the persistence of the popular belief in birthmarks, in the formative power of the mother's imagination upon the child. "We even find," he says with tears that one can hear falling on the paper, "that this superstition has not been thoroughly outgrown by the profession itself." Loftily disdaining all the facts known to all peoples in all times, he argues:

Are such stigmata even possible in the absence of a nerve connexion? But (*italicised*) *there is no intercommunion whatever between the nervous systems of the mother and the child.*

How does he know? The microscope has not yet shown any; but the microscope is only just beginning to suspect that there is a nervous system in plants. And to argue *à priori* and in defiance of countless facts, that imagination cannot make the transit because there is no nerve to run by, is no better than to maintain that a magnet cannot affect a poised needle ten feet away because there is no wire connexion.

But the other pole of belief is as mischievous as this. Says a mother, writing to a health paper:

I determined that my children should all be musicians. They have all answered to my will and took to musical instruments like young ducks to water.

Born hypnotized! and no more musicians for that than a dog is a man because he is taught to stand on his hind legs. The natural formative work of their own souls has been interfered with, and that must be done slowly and imperfectly in post-natal years which might have been done swiftly and easily in pre-natal months.

But it does not follow, because the mother may not ignorantly interfere, that she may do nothing. Her task is to provide the atmosphere in which the soul of the child may work at its best. If she will keep her *own* life and thought clear and sweet and sunny, her *own* feeling free from moods and whims; and will hold the thought of her child as a *soul* whose earlier years are to be in her charge as a sacred trust—she will be serving it and humanity. Give it *this atmosphere* and she may trust it to find its own best path. STUDENT

## THE SACRED BO TREE, ANURĀDHAPURA, CEYLON

### Sacred Bo Tree, Anurādhapura

**T**HIS tree (*Ficus religiosa*) is said to be the oldest historical tree in the world; according to the *Mahāvamsa* (literally, "Genealogy of the Great"), the ancient chronicle of the Sinhalese nation, it was planted in the month of December, 308 B.C., on the spot where it stands to this day.

The royal missionary Mahā Mahinda Thera, son of the great Indian Emperor Aśoka, had converted the King (Devānāmpiya Tissa) and the people of Anurādhapura to the tenets of pure Buddhism. Princess Anula, the consort of the sub-King Mahānāga, and hundreds of her fellow-countrywomen wished to take vows and enter upon a life of self-devotion. But Mahinda declared that although he had been the instrument for their conversion, only a woman could initiate them as novices, and for this purpose sent for his sister Sanghamitta, prioress of a Buddhist nunnery at Pātaliputra, in India. In response to this call, the royal priestess came to Ceylon, bringing with her, as a gift from the Emperor Aśoka, a branch of the sacred tree in the shade of which Gautama S'ākyamuni attained to Buddhahood.

From this branch grew the very tree which still flourishes at Anurādhapura, and the history of which, says S. M. Burrows in *The Buried Cities of Ceylon*, "has been handed down in a continuous series of authentic chronicles [*i. e.*, the *Mahāvamsa*].

It was carefully tended, enriched with stone-carvings and terraces, and honored with magnificent ceremonies, by successive dynasties; and was spared amid the havoc of invasions, owing its immunity either to divine protection, to superstitious reverence, or to its intrinsic worthlessness to a plunderer. It was visited by the Chinese traveler, Fa Hian, in the Fifth century A.D., and was endowed with lands by Rājā Sinha, the despot of Kandy, so late as A.D. 1739. . . . The leaves which fall from the Sacred Tree are highly esteemed as relics by the thousands of pilgrims who visit it during the full moons of June and July."

The following quotation from the *Mahāvamsa* indicates the veneration in which a devout Buddhist holds the tree:

"This Bo-tree, monarch of the forest, endowed with many miraculous powers, has stood for ages, in the delightful Mahāmegha Garden in Lankā [*i. e.* Ceylon], promoting the spiritual welfare of the inhabitants and the propagation of the true religion."

STUDENT

### Was Eve a Negress?

**O**NE reads in a newspaper that a learned and reverend lecturer, described as the "ecclesiastical envoy to King Menelik of Abyssinia," says that Eve was a negress, and that Moses, Solomon, and Homer, were all negroes. When

Moses in *Exodus* iv, 6, puts his hand into his bosom and draws it forth white as snow, the implication is obvious that his hand was originally black! But the ordinary version of Scripture says "leprous as snow," not "white as snow."

Some time ago the *CENTURY PATH* (vol. x, no. 52) noticed a theory concerning the predominance of dark races at a certain time in the past, in which the author sought to make out that the civilization of other races had been derived from them. Often somebody gets hold of a few facts and proceeds to build a theory on them as if there were no other facts. We might just as easily create a yellow, brown, or red theory of humanity. It is essential to study widely before proceeding to inference.

### "Evolution" of the Greek Temple

**A**N archaeological note informs us that a certain theorist traces the origin of the Greek temple from a primitive house, raised on piles, such as is common in the Celebes. The peripteros represents the outer row of piles, while the naos is formed by enclosing the inner row. The original dwelling has shrunk to the merely ornamental pediment and entablature. The triglyphs occupy the place of windows.

This is an instance where the desire to trace evolution from primitive types becomes a craze. T.

# ✻ The Trend of Twentieth Century Science ✻

## Animal and Plant Life

**A** GERMAN biologist, Dr. Ludwig Reinhardt, has been pointing out the essential artificiality of the line which is currently taught to lie between animal and vegetable life. His article has, moreover, one or two implications which he either does not see or does not dwell upon.

It is a long time since the line has been thought absolute. Now we may say that it does not exist, or that all plants, and possibly all animals lie on both sides of it. Some organisms are so equally on both sides that we cannot assign them to either class.

The essential power of a plant is to take carbonic oxide from the air, split it by means of the energy which it gets from sunlight, return the oxygen of it to the air for animal use, and keep the carbon for the building of its own tissues. There is free nitrogen in the air, but this immense store the plant cannot touch. It must get its nitrogen from the soil, from nitrogenous compounds therein.

The animal can neither get its carbon nor its nitrogen in that way. Both must be supplied in its food, and the food must have lived, and must have formed part of a vegetable or animal body. It does not get heat or energy from the sun, but by burning the carbon of its food. To effect this burning it must take in oxygen by respiration.

Every one of these statements requires qualification. Plants, in addition to taking carbonic oxide from the air and splitting it, breathe as do animals, take in oxygen and return carbonic oxide. But, except at night, the latter process is masked by the greater activity of the former. Their breathing has the same results as in animals; it gives them some energy, and it enables them to maintain temperature. It has been noted that some flowers can maintain a temperature much above that of the surrounding air.

We now know that some few plants, for example the nettle, *do* take naked nitrogen from the air, and it seems probable that in some degree all *do*.

And we know, of course, that some plants are carnivorous, feed on living animal matter such as flies and digest it as we do by means of pepsin and hydrochloric acid.

So much for the plants. They cross the line to the animal in that they breathe as the animal does and for the same purposes, and may feed and digest as the animal does.

In the same way animals cross the line to the plant side and exhibit every power possessed by the plant.

Plants absorb carbonic oxide and split it by means of a green matter named chlorophyl, the green of their leaves in fact. But there are animals which also make chlorophyl and use it for the same purpose. They too absorb carbon from the oxide and return the oxygen. And others do the same without chlorophyl. Except in the case of some crabs, who use the carbon for their shells, this is a very recent discovery, due to a lady biologist, Countess von Linden. She has found that the larvae

and pupae of butterflies, under the influence of sunlight, habitually absorb carbon dioxide, keep the carbon for their growth, and discharge the oxygen. Nor is even sunlight absolutely necessary. The pupae of some butterflies, and some nettle plants, can do this in absolute darkness. The source of the energy they thus expend is a little doubtful. It is assumed to come from their respiration. "This power of assimilation," says Dr. Reinhardt, "identical with that of plants, will probably be discovered very generally throughout the animal kingdom." He adduces the increase of weight in snails during hibernation, of marmots during the same condition, and finally remarks: "A like increase of weight has been noted in fasting animals and in one human faster."

Nor is it true that the naked nitrogen of the air is unavailable for either animals or plants. Besides the nettle, which we have already noted, the Countess von Linden found that most of her pupae absorbed and used it.

It would appear, however, that the animal found other and easier ways of rebuilding its tissue. But when the other ways are not available, as in the pupal state, in hibernation, and in fasting, it can revert to the use of the latent power.

An English physician, Dr. Rabagliati, on the basis of some experiments of his own to which we shall refer later, has recently argued that the bulk of the energy which we use through life is *not* derived from our food, though he confesses that he does not know whence it does come. All the food we really need, according to him, is that small amount necessary to replace actual waste. May it be that we are not only capable of using, but do habitually use the plant power of assimilation both of carbon and of nitrogen? Mankind of the future at any rate may learn to re-awake it, living on the particle of food necessary for the replacement of actual waste of parts of the machinery, or, like some plants, on water and air only. Even if it cost them something to split the carbonic oxide, they would infinitely gain in saving the vast life-labor of digestion.

STUDENT

## Contaminated Ice

**A** SERIES of experiments have been made in order to settle the question of the fate of bacteria in artificial ice or in ice taken from sewage-contaminated water. Considering the amount of ice we eat the question is certainly important.

The results show that bacteria cannot remain alive indefinitely, or even very long, in ice. The farther the temperature below freezing, the shorter their term of life. Their power of resistance varies. But so far as has yet been ascertained, no bacterium can survive twenty weeks of a temperature that is just below the freezing point. At lower temperatures the term shortens very much. The Commissioner of the New York Board of Health reports:

According to our best authorities, we may say

in general that bacteria are reduced in number about fifty per cent after exposure to freezing temperatures for a period of one hour; ninety per cent after twenty-four hours; and practically one hundred per cent after exposure from two to three weeks. The few that are not killed after exposure for, say, one month, have become so attenuated as to be unable to produce disease.

One observer supposes that their death is due to inability to move about and get nourishment; but this inability would not increase with decreasing temperature. Ice is as solid at a low as at a (relatively) high temperature. Nor, for the same reason can it be entirely due to accumulation of their own excretion products. Cold must have some definitely noxious effect on protoplasm.

STUDENT

## Symbiosis

**A**N interesting little bit of mutual service between plant and animal life occurs in the case of certain transparent worms and jellyfish. They are the (presumably) willing hosts of innumerable one-celled plants, algae. In accordance with the terms of partnership the latter sacrifice a proportion of their numbers to the food needs of the former. In return they are fed by the carbonic oxide formed in the former's respiration. Being plants they can split this up again into oxygen and carbon. The oxygen is available for the host; the carbon is the food of the guests. Being thus fed they multiply, and the excess of their multiplication is the food of the host. The circle is complete; the serpent swallows his tail. The fit of course is not perfect or we should have a case of perpetual motion. The host gets more oxygen and more food than his tenants can supply. But that is his private affair. How agreeable it would be if we could tame the bacteria in our bodies, make them use the products of our respiration and tissue waste, and in turn feed inwardly on their superfluous numbers! Even those that were thus fed on, would, as evolving life-monads, profit by their very intimate association with so highly evolved a form of life as that of our bodies; and they could re-incarnate in new bacterial forms the moment we had done with them. Perhaps this is somewhere in nature's plans for our and their future. "The lion shall lie down with the lamb" will read "The bacterium shall lie (harmlessly and usefully) inside of the man."

STUDENT

## The Starvation "Cure"

**C**HICAGO reports a case of death from the starvation "cure." The malady was cancer and the death occurred on the fortieth day.

There is no good result to be obtained from starvation which cannot be better obtained, and with entire safety, from a wisely supervised reduction of diet. It seems possible that in the case of cancer the reduction may, if scientifically done and if backed by proper local and general medical treatment, be brought to a point at which the normal tissues take and properly use all the nourishment given, leaving nothing for the morbid growth. ## "FACING WESTWARD"

Evening, at ebb of tide, from the foot of Lomaland Cliffs

## The Beach at Lomaland

FOR lovers of that enchanted realm where land meets sea there is no more inviting resort than the Lomaland beach at low tide. Its westward aspect is sheltered and quiet even when the wind is blowing above. All the usual beauties of the shore are found there in abundance: sand golden, white, black; rocks smooth and rough, with little fairy pools like miniature worlds of beauty; shells and seaweeds; and above all the balmy invigorating air. At sunset the colors on sky, sea and land are beyond all imagining both for variety and richness. The Ocean of Peace is never in an angry mood, however majestic in his might.

## Mummy Wheat

AN English paper gives a sketch of the produce of one grain of wheat obtained from an Egyptian mummy. The seed was brought from Thebes, and at the most reasonable computation 2400 years must have passed away since it was put into the tomb. There were upwards of 1600 grains of corn in the fifteen stems produced.

Some years ago an Australian correspondent wrote to the CENTURY PATH describing some mummy wheat which her grandfather had and which he sowed with similar results. T.

## The Fair Hills of Ireland

Take a blessing from my heart to the land of my birth

And the fair hills of Eire, O!

And to all that yet survive of Eber's tribe on earth

On the fair hills of Eire, O!

In that land so delightful, the wild thrush's lay

Seems to pour a lament forth for Eire's decay—

Alas, alas! why pine I, a thousand miles away  
From the fair hills of Eire, O!

James Mangan

"ONLY those that have seen the fair hills of Ireland, the beautiful waters, the simple, earnest people, the bare-footed children, the little cabins, can know what the word Ireland means to an Irish man or woman.

"It is a most beautiful country. It has sheltered and developed courageous human beings, men of great genius, women of the finest mental and moral character. It has given to all the world strong workers, good generals, plucky, unselfish individual fighting men, legislators, poets, orators, writers of power. . . .

"When Greece was at her greatest she got from the Celts—then dwelling north of Greece—her blue eyes, her genius for poetry and art. It was not Asiatic nor African blood that made the genius of Greece. It was the Celtic and Germanic blood of Europe. It was the wonderful Aryan race of the cold, dark Northwest that produced in Greece,

in Rome, in France, in Spain, and that produces now in America and throughout the world forces for human development.

"There are Irish names on South American battle-ships; there are Irish names written at the tops of the most important pages of English history; there are Irish bones under the ground of every great battlefield in this country and in the Old World. It is a wonderful race, as young today, as full of power, as in the old days of Greece."—Los Angeles Examiner.

One can hardly help wishing, in reading such rhapsodies as the foregoing, that the old days, before the *Serpents* were driven from Ireland, were back again; and that its people, with so many excellent qualities including a natural devotion and perception of the beautiful united to a rare courage, had not so long allowed their aspirations to be exploited by the class of people who exterminated the *Serpents*, and who both by tacit acquiescence and by the influence of example have helped to foster the luxuriant growth of another kind of serpent—alcohol, in its various forms! For, as any student of ancient world-religions knows, the word "Serpent" was but a glyph for the Wise Ones of the human race; and in perpetuating every March the memory of their extermination from Ireland, do not the Irish but perpetuate the memory of their plunge into the dark ages of holy inquisition, ignorance, and false psychological influences?

The spirit of the past will return when the lesson of unity has been learned. IRISH STUDENT

### 'Johnny Appleseed'

WE stand now at the dawn of a new century. All the forces of the universe seem to be ours for the asking. With or without wires, we can flash messages round the world. In an incredibly short time we can travel across continents and oceans. We have almost eliminated time and space — and yet — where are we really standing today? In our marvelous intellectual strides have we not passed by one small but most important gateway? Have we not forgotten the chambers of the heart, albeit that the secret rooms of the head are opened to us? In our march onward have we not been so eagerly longing for the goal of victory that we have often stepped on our weaker brethren, to get ourselves into the sacred places of the Most High? If we look about us over our civilization, we see misery and wrong-doing everywhere. Are we not brothers of one great family, and were not the open doors meant for all? One door we have too often forgotten to open — that portal of the heart which only yields to the small golden key of compassion. If we have lost that key there is nothing to do but to find it again, for if we possess all the riches and knowledge in the world, and are without this, we are nothing and have nothing; — “as sounding brass and tinkling cymbals.”

All really great men have had this key. They have builded for the future and for generations to come, content to make their own interests secondary; so they have builded wisely and well. The history of America has been rich in such great names, and all honor has been done to most of them; but there is one man of whom we hear almost nothing, who yet surely had this key of compassion and used it wonderfully.

In 1837 a representative from Ohio rose in his seat at the Congressional Library at Washington, and spoke to the Congress of the death of an old man, who had, he said, “done more for the West than any other man of his era.” Secretary Sherman also spoke of him as “one of the most striking figures of the republic,” and later the citizens of Ohio erected a monument to this “outstanding man of the Heroic Age in American History.”

He was John Chapman, called popularly “Johnny Appleseed”; and it seems that he first appeared on the Ohio River, in the then almost unknown West, in 1790. Legends, myths, and traditions are clustered around his name, but he left no historical records. In 1789 he set out from the valley of the Potomac to travel through western Pennsylvania, and down the Ohio in the following summer in a boat filled with appleseed. Absolutely alone he journeyed through that great unknown land with his bags of seeds which he had collected from the farmers in the East —

on towards the setting sun, his only guide through the forests and untraveled land.

When he found anywhere an open glade he stopped and dug up the soil, planted thousands of seeds and wove around his garden a brush fence to keep it protected from the animals of the forest. Many years after those fruit orchards were found there by the weary settlers waiting for them in the wilderness; peach, apple and pear trees, grape vines and so forth, for it was not only appleseed that this wise man brought with him into the West. Surely there was something here unusual, a rare selflessness; a mind reaching down through the years towards hosts of unborn men and women; thinking for them, planting for them, toiling for them. He made no orchard for himself; laid out no land, and made no home beautiful. Because John Chapman passed that way, there was food for the settler and a resting-place; the bitter edge of weariness and hunger was taken off for thousands of the first wanderers to the west; we may say that he brought a benediction on the whole land.

### The Path

“THE Path is one for all; the means to reach the goal must vary with the pilgrim.” Such was the instruction, ages old, given in every age to those who desired to become wise, by the teachers of Divine Wisdom, the Custodians of the Heart-Doctrine.

William Q. Judge wrote:

There is a great Cause—in the sense of an enterprise—called the Cause of Sublime Perfection and Human Brotherhood. . . . Man is a being who may be raised up to perfection, to the stature of the Godhead, because he is himself God incarnate. This noble doctrine was in the mind of Jesus, when he said that we must be perfect even as is the Father in Heaven. This is the idea of human perfectibility. . . .

The third idea is the illustration, the proof, the high result of the others. It is, that the great Helpers of Humanity—those who have reached up to what perfection this period of evolution and this solar system will allow—are living veritable facts, and not abstractions cold and distant. They are . . . living men. These Helpers as living facts and high ideals will fill the soul with hope, will themselves help all who wish to raise the human race.

It is for the furtherance of these great ideas, it is to bring humanity to a sense of the true purpose of existence that the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY exists. For there is a path that leads from ignorance to wisdom, from strife and war to peace, and as said by William Q. Judge, there are those who have trodden it, who can show us the entrance and the way. The Messengers of Truth are always among us, century by century, and always a few follow them.

The Path spoken of is the path of power, the path of conquest, for it frees men from their imprisoning vices. Step by step the pupil may climb to the heights of perfection through self-conquest, conquest of the lower or animal nature, and the personal limitations that encompass us all so long as we regard ourselves as separate units with destiny and interests apart from our fellow men. The truth, so Theosophy teaches, is that in our Higher Natures, our real natures, the soul, in fact, we

are united; and that there is in man that which distinguishes him from the brute, namely conscience, and the knowledge of right and the will to do right.

Ye are Sons of God, Children of the Highest! What a glorious thing it will be when this is realized by the whole world. For this teaching, given by all the Wise Ones in all ages is true, and there is a path to the center and core of our being, the place where Divinity dwells, the innermost heart of man. How shall we find the way? Be brotherly; live for others; that is the first step on the path. Test all thought and act by that standard and thus shall you come nearer and nearer to the companionship of Wise and Compassionate Ones who dwell in the Heart of the World, the spiritual part of Nature to which we also belong.

Our heritage is to share in the glorious work of bringing Light into the darkness of material existence, but not until we have learned to love the Higher Law with all our heart and with all our strength shall we have entered upon the way. It is Theosophy, brought again to the world by our Teachers, H. P. Blavatsky, W. Q. Judge, and Katherine Tingley, that through the ages has called to men to follow the Light and tread the Path that leads to the heights. E. I. W.

### The Principle of Desire

“THIS fourth principle is the balance principle of the whole seven. It stands in the middle, and from it the ways go up or down. It is the basis of action and the mover of the will. As the old Hermetists say: “Behind will stands desire.” For whether we wish to do well or ill we have first to arouse within us the desire for either course. The good man who at last becomes even a sage had at one time in his many lives to arouse the desire for the company of holy men and to keep his desire for progress alive in order to continue on his way. Even a Buddha or a Christ had first to make a vow, which is a desire, in some life, that he would save the world or some part of it, and to persevere with the desire alive in his heart through countless lives. And equally so, on the other hand, the bad man life after life took unto himself low, selfish, wicked desires, thus debasing instead of purifying this principle. On the material and scientific side of occultism, the use of the inner hidden powers of our nature, if this principle of desire be not strong the master power of imagination cannot do its work, because though it makes a mold or matrix the will cannot act unless it is moved, directed, and kept up to pitch by desire.

“The desires and passions, therefore, have two aspects, the one being low and the other high. The low is that shown by the constant placing of the consciousness entirely below in the body and the astral body; the high comes from the influence of and aspiration to the trinity above, of Mind, Buddhi, and Spirit. This fourth principle is like the sign of Libra in the path of the Sun through the Zodiac; when the Sun (who is the real man) reaches that sign he trembles in the balance. Should he go back the worlds would be destroyed; he goes onward, and the whole human race is lifted up to perfection.”—William Q. Judge

## PASSION

Archibald Lampman

AS slowly on a mountain slope toward spring  
The soft snows gather week by week, and charge  
The peaks and slanted ridges smooth and large  
With drifts that hang light-poised and glistening:  
Then sharply on the hidden key by chance  
An echo strikes, and like a storm unpinned,  
Down a hundred ledges light as wind,  
Loosens and shoots the thundering avalanche.  
So in the soul our passions year by year  
By the cool winds of custom banked and rolled,  
Gather and deftly balance, and hang clear;  
Then on the inner master-chord one day  
Some fateful shock intrudes, and all gives way  
In wild descent and ruin manifold. --- *Selected*

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

JH

**Question** According to Theosophy, what relation does the human kingdom hold to the animal?

**Answer** It may be said that man is the god of the animals, the only god they know. Time and again instances have been recorded of the wild creatures having come to him for help or sympathy, when the need was so heavy on them as to overcome their natural fear. That many of them will kill and eat him argues in no way against this; we commonly crucify our own gods, when they come among us and occasion permits. Man stands above the animal world, giving it all it has of thought or character. The tiger tears its prey, but man was the fountain of his angry cruelty; the peacock rays aloft his plumage and struts, but there is no vanity not human in its origin.

We do not often speculate how near and how important the connexion between the two kingdoms may be, yet there is room here for forests of thought. Our right is paramount over brute creation, we say, and must be obeyed. How very glib we are always, with our talk of rights, and how silent, at least inwardly, on the matter of our responsibilities! Yet we should not far exaggerate if we said that only the animals had any rights at all, while the duties remained for our share. This is not advocating sentiment; undoubtedly the rattlesnake should be killed at sight, and all poisonous or menacing things. But in a deeper sense we have a responsibility to creation which must be worked out in that little workshop of self wherein nearly all our duties lie.

We cannot accuse the animals of a moral sense which they may break or keep. They may have laws, which long racial experience in the forest has taught them to keep, so that every mother trains her young in them; but the terms selfish and unselfish can have no meaning for the animals; they have not arrived where these things begin to exist. Hunger presses upon them, which drives them out after food; the keen search, the hunt, the kill — have nothing of evil in them, because no pole of altruism with which to contrast them. The Law inflicts hunger on the wild things for no other reason than to drive them hunting, that their senses and consciousness, may be trained and sharpened. One day that consciousness, which is now a mere outlook on the world, will have received such culture and intensification through experiences of pleasure

and pain, that it will be fit to look in upon itself, and blossom into the soul-consciousness of the human being. At present it is what the sun and the rain, and their hunting, and tyrant man will allow it to be. The driving force of their evolution is desire, bringing upon them experience through sensation. They are not troubled with religion or commerce or politics, but fulfil their own nature, embodying the desire of the world.

We on the other hand, embody the world's thought; at least we are here to embody it. We can plan, sacrifice, intend; we can give, or grab all to ourselves. For us there is a choice between two poles of behavior; selfishness and unselfishness come to mean something. For us there are infinite complications of motive, infinite complications of character; animal simplicity has gone forever.

Animals embody the desire of the world; and yet we too, have the handling so to say, of all of it. For all that we might have reason and thought at our command, we choose to let desire pass through us, getting whatever impress we may set upon it by the way. It is the food and life of the animals, all they have of enlightenment; natural and right to *them*, because it is the means evolution employs to lead them upward. But with us, to follow the light of the animal world means ruin. We have a check in our mentality for desire, and must use it or be destroyed. Their meat is our poison. The wolf and the lion kill for the sake of eating, and eat that their hunger may be satisfied. We kill for the sake of sport, and eat for the delight of our palates. We even vivisect (which is a kind of sensuality). Some animals are no better, you say; watch the cat play with a mouse. Yes — but the cat has no hypocrisy; she says nothing about the advancement of science. We have taken the propensities of the animals, and evolved them into vices and sins. We have mingled mentality with desire, making both these natural things, by their unnatural mixing, corrupt and venomous. Desire was the tool of evolution in the animal world; we have taken it, and made of it a counter-impulse against evolution.

So we have poisoned the whole stream of the world's desire, sending down this corrupted mentality, this evil and malicious intention to the lower kingdoms, and especially to the animals as being the nearest to ourselves, to infect their natures with the reflection of our vice. So the whole creation groans and travails together, waiting for us to go forward for the whole universe, to win a battle for the whole universe. So it is we who have created the ghastly blood-lust of the weasel, sharpened the serpent's tooth and the tiger's claw, filled the waste places of the earth with the abominations of cruelty. So in the Golden Age, the lion and the lamb will lie down together, and the child shall lay his hand on the cockatrice's head.

K. M.

**Question** Does the soul ever depart from the body during life?

**Answer** That this is possible is one of the teachings of Theosophy. The connexion of the soul with the body during earth-life is one of the deepest mysteries, yet there is much that we can understand. We may know by observation and especially

by our own experience, that the soul, the real I, has greater power to express itself when the life is pure and unselfish, and the higher and nobler the life, the closer is the connexion between it and the personal man — the latter in fact becomes a more perfect instrument for the soul to use.

The opposite of this is likewise true, that as the lower life is lived, a life of passion and self-gratification and indulgence, of grasping ambition and selfishness, or of mere intellectuality, so does the nature become less and less responsive to the influences of the soul. And if the life should become so evil that it is lived for the sake of evil, and there is nothing in the nature that can respond to the soul, the soul can have no more hold on that life and must perforce depart, leaving only the semblance of a man behind. Such a man would in fact be soulless, and H. P. Blavatsky has said that we constantly elbow such soulless people without our knowing it.

This condition is not brought about merely by indulgence in animal passions, but more surely by the wrong use of the mental faculties. Hence a man may have all the appearance of respectability, may hold high offices in the community, may even appear and profess to be deeply religious, and yet be — soulless. A short time ago a question was asked regarding the story of Dr. Jekyll and Mr. Hyde; they are everywhere, and yet the people are asleep and do not discern, and do not know how to guard against them. And because of this ignorance, this negligence — one cannot call it anything else — especially on the part of parents, we read, as was the case only a few days ago in the public press, of human monsters, even in the garb of religious guides and instructors of the young and holding high public positions. The public read these things and say how dreadful, and the next day forget all about them. But more and more through the teachings of Theosophy, is the searchlight of truth being thrown on the dark side of human nature and more and more of these things will be revealed because they do exist, and cannot be longer hidden. Theosophists are not pessimistic, far from it, but neither will they shut their eyes to the facts, or to the evil that exists in the world. On the contrary they are optimistic, because they know that the remedy lies in Theosophy and Râja Yoga, which is the practical application of Theosophy to daily life.

The time is coming when the world must awake to these things, and become a more perfect instrument through which the World-Soul may act; and because of the interdependence of all, because of the fact of universal brotherhood, every thinking man and woman has a deep responsibility to guard the on-coming generation from the soulless human monsters that menace all that is beautiful and pure in life. If we do not take this responsibility and respond to the call that is made upon us, then we share in the hidden evil of the world, and are cutting the threads that bind the soul to ourselves, shutting the door through which the soul comes and goes bringing with it the radiance of a diviner life. Either that, or by arousing ourselves to unmask and fight the evil in the world, first seeking to purify our own natures, we shall make possible a closer union with the soul, and help to bring about a fairer life for all earth's children, and transform the earth into a heaven. STUDENT

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Theosophy versus Despair

SOMETIMES people doubt whether any theoretical philosophy can avail to remove the affliction of man's soul when he is thoroughly discouraged with the burden of life, or to bring relief to those hard pressed by poverty and want. If this were true, it should be at least equally true that no philosophy can depress him either. But in our foolish pessimism, we often see only the dark side and allow to evil a power which we deny to its opposite good. If the burdens of life are increased by doubt and mistaken belief, they can be alleviated by removing the doubts and correcting the belief.

But these influences act slowly and on a large scale. The despair which leads to suicide, the limited and clouded vision which leads to rebellion against eternal justice and to reckless desperation, the want of interior calm which leads to drinking and drugging—these are the outcome of ignorance about the essential problems of life, of false theological teaching, of animalistic scientific theories, and of an inveterate habit of regarding oneself as the center of the universe. Acting through many successive generations, and over a large area, these influences have gradually produced the conditions, external and internal, that engender despair.

And the would-be reformer must also plan his work on the same large scale. If his philosophy cannot always instantly remove conditions that are the growth of centuries, it can remove them slowly and surely, which is the way in which they came.

And the extent to which current ideas are responsible for dark views can easily be seen from a perusal of much that is written. Take the following for example.

"Life often seems to me arranged upon the principle of a game of cricket. . . . You step to the wicket, you have only a single chance; the boldest and most patient man may make one mistake at the outset, and his innings is over; the timid tremulous player may by undeserved good luck contrive to keep his wicket up. . . . One boy at school may break every law, human and divine, and go out into the world unblemished. Another timid and good-natured child may make a false step, and be sent off into life with a permanent cloud over him. . . .

"And then we pass into the larger world, and what do we see? A sad confusion everywhere. We see an innocent and beautiful girl struck down by a long and painful disease—a punishment perhaps appropriate to some robust and hoary sinner who has gathered forbidden fruit with both hands. . . .

"Let anyone run over in his mind the memories of his own circle, fill up the gaps, and ask himself bravely and frankly whether he can trace a wise and honest and beneficent design all through. . . .

"It is the wilful sin of man, says the moralist, that has brought these hard things upon him. But that is no answer, for the dark shadow lies as somberly over irresponsible nature, which groans over undeserved suffering. And then, to make the shadow

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

darker still, we have all the same love of life, the same inalienable sense of our right to happiness, the same inheritance of love. If we could but see that in the end pain and loss would be blest, there is nothing that we would not gladly bear. Yet that sight too is denied us."—(From a recent book)

And the author takes refuge in the belief that what we think is evil is not really evil at all but hidden good.

"And then we feel in our own hearts how indomitable is our sense of our right to happiness, how unconquerable our hope; how swiftly we forget unhappiness; how firmly we remember joy; and then we see that the one absolutely permanent and vital power in the world is the power of love, which wins victories over every evil we can name; and if it is so plain that love is the one essential and triumphant force in the world, it must be the very heartbeat of God."

And when the day comes for us to die—

"We shall find that love awaiting us in the region to which the noblest and bravest and purest, as well as the vilest and most timid and most soiled, have gone."

Now let us consider the above. Ignoring the final promise of future happiness in the mysterious hereafter, which appears to have been thrown in as a makeweight, let us consider the main point—that our consolation lies in our unconquerable inner sense of an all-conquering love. We have this intuition on the one hand pitted against two adversaries on the other hand. These two adversaries are the circumstances of life and our false philosophy. How would the matter stand if the philosophy could change sides and ally itself with the intuition against the worldly circumstances.

The author's views stand in his way all the time. His fight is not really against circumstances but against those views. His intuition struggles to find, amid the paraphernalia of modern thought, ideas in which to express itself; and failing, falls back on what after all must to many seem platitudes, and on a vague and non-committal allusion to the theological heaven. "If we could but see that in the end pain and loss would be blest. . . . Yet that sight too is denied us."

At this point Theosophy takes positive and decisive issue. It declares with all possible emphasis that such a sight is not denied us; nor will it consent to accept any number of instances of what *has been* and what *is* as evidence of what *may be and can be*, or allow the past and present to limit the future.

May not man at this moment be standing on the threshold of a new evolution that will lift him out of valleys in which he has been wandering for centuries, millenniums?

The essence of Theosophy's teaching is that man *can* attain to knowledge and wisdom even here on earth. The light of the immortal Soul can shine through the clay, if the clay is purified; nor need we wait until death has removed the clay. The au-

thor admits the existence and power of this immortal Self of man, which he attempts to define dimly as "Love." He concedes it virtually unlimited power over the weaker nature. But his faith outstrips his reason, and by his brain is the winged steed jerked back towards earth again, making a wild clutch at heaven in passing.

The idea that man possesses higher faculties which may be unfolded and brought into action alters the whole aspect of the question. For then we must infer that these higher faculties will endow man with a clearer vision, enabling him to see things in their true relations and showing him that the present outlook is illusive. Then we may infer that the Love which the author extols so warmly can become an ever-present tangible reality instead of a beatific vision, the essential law of life instead of an exotic condition.

The teaching as to *Reincarnation*, too, alters the entire aspect of the problem of inequalities. Granted that the life-history of a Soul extends over countless ages, how can one be expected to be able to trace out the chain of cause and effect, merit and recompense, within the limits of some seventy years? How can we presume to judge the rights of a Soul until we are able to trace its past back through the ages? Again, in view of the age-long life of the Soul, the punitive aspect of suffering becomes less important than the educational aspect.

Can Theosophical philosophy alleviate pessimism and despair? The answer of experience must be a positive Yes! The mere mental acceptance of its teachings goes a long way towards removing doubts and giving a new start in life. But, as time goes on and this acceptance deepens into knowledge, the whole outlook on life changes and peace and light gradually replace the former unrest and gloom. True, so long as one remains more or less under the dominion of his lower nature, he will be to that extent subject to fluctuations of mood. Yet, for a Theosophist these are neither so intense nor so frequent. And gradually these fluctuations become more and more superficial, while the permanent thread of the deeper peace runs through all and is never lost. As his goal, the Theosophist ever looks forward to the time when he will be more and more emancipated from the delusions and moods which cause affliction. But his goal is not that of the monk or visionary. He seeks emancipation and the power it gives, only that he may use that power in service and beneficent work for the race. STUDENT

# The Theosophical Forum in Isis Theater

S a n D i e g o C a l i f o r n i a

## Last Sunday Evening in Isis Theater

AT the meeting of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY last Sunday in Isis Theater, San Diego, the Hon. Emilio Bacardí and Señora Bacardí, were present as Katherine Tingley's guests in her box. Señor Bacardí has been an enthusiastic admirer of the work of Katherine Tingley from the time of her first visit to Cuba, when she rendered such efficient help to the unfortunate sufferers at the close of the war. From the time he first met Katherine Tingley he has been an enthusiastic supporter of her work and has rendered great assistance in the establishment of the Râja Yoga system of education in Cuba. Señor Bacardí and his wife are at present paying a visit as Mrs. Tingley's guests to the International Theosophical Headquarters at Point Loma, where they have two daughters in the Râja Yoga Academy. Señor Bacardí is one of the most prominent and respected of the Cuban patriots; he has been twice Mayor of the city of Santiago and was subsequently Senator from the Province of El Oriente. The other boxes were occupied by some of Katherine Tingley's Cabinet Officers and others prominent in the work at the Point Loma Headquarters. The music which always gives such distinction to these meetings was rendered by the Point Loma Orchestra, and included the following selections: *Adagio—Allegro*, 2nd Symphony (Haydn); *Chanson sans Paroles* (Tschaiakowsky); *Agnus Dei* (G. Bizet).

A large audience listened most attentively to the music and the addresses, one of which was read by Mrs. Walter T. Hanson, who is well known in San Diego as the Principal of the San Diego Râja Yoga Day School, and who has been temporarily away on a visit to her old home at Macon, Georgia. The subject of the paper was *Theosophy Alone can Answer the Problems of the Twentieth Century*, and covered many of the questions of pressing importance today, including the existence of the soul and the higher and lower natures of man, the duality which is so clearly distinguished by Theosophy and yet about which the world at large is so deplorably ignorant. The problem of divine justice against blind chance was next considered, and it was shown that without the Theosophical key contained in the doctrine of Reincarnation and Karma it is unanswerable, and it would so be impossible to accept the ancient teaching of Theosophy repeated by Paul in the words, "Whatsoever a man soweth, that shall he also reap." The meaning of Freedom arises from the idea of Law, and Theosophy proves to us that we can never be free as long as the animal and selfish side of our nature reigns almost supreme. The only true freedom is obedience to the control of the Higher Self within—the divine voice which is first heard in the conscience.

The position of woman and her influence in the molding of the lives of the generations to

come is one to which Theosophy gives great attention. "Are we women so fashioning our homes that our sons and daughters, husbands and fathers, regard them as a sacred place, the source of their inspiration and strength? Do you not see that this is truly one, if not the greatest, of life's problems today—to strive to keep the home a sacred place, to have it free from unholy thoughts and desires, so that the little souls that abide there are not fettered and cramped but can unfold in the purest sunshine of earnest effort towards the living of the highest ideals? If women could but realize the Theosophical ideal of the divinity of human nature more fully, and the power and responsibility they have in unveiling this in their children by the care and discipline of the first few years of life what a different example they would set before these little ones. . . . O fellow women, it takes divine strength and wisdom to stand strong at your citadel, and in Theosophy alone can you find the key that unlocks the door to the mysteries of life and solves for you the mighty problems of the Twentieth Century!"

The second paper was read by Miss Nan Herbert, Directress of the Râja Yoga Academy at Santiago, who is spending a vacation at Point Loma and receiving instructions from Katherine Tingley as regards the necessary arrangements for the great enlargement of the educational work in Cuba by the establishment of the new Academy on San Juan Hill, Santiago, which is already in course of construction. The subject of Miss Herbert's address was *Theosophy and the Nations*. She drew a vivid picture of the unrest of the present day, but through it all, she declared, the student of Theosophy can recognize the first stage of a new order of life for the nations of the earth.

Conditions have so greatly changed in these latter days that we can easily follow the international waves of thought and feeling, and it is in their world-wide aspect that we can see a new hope for humanity. Asia is now invaded by the modern spirit, and the people are receiving constitutional rights. Africa is becoming opened up by the newest methods of transportation and it would seem as if there would soon be no more unexplored regions. Under the new conditions the whole world may rise to a higher degree in human life than has been known for ages, but there is also danger that the forces which can be used for the unification and uplifting of humanity may be seized upon by the evil-minded and used for the destruction of the hopes of a regenerated humanity. This is a time of choice. As Katherine Tingley has said, "Humanity has long wandered through the dark valley of bitter experience, but the mountain heights are again seen, suffused with the glow of dawn and the promise of the new golden age. The path is once more seen to that realm where the gods abide." The appeal is to the real man, the Soul, and so it was that Theosophy was brought into the world at the right time,

and in its branch department, the Râja Yoga educational work, lies a hope of redeeming the nations from the selfishness and weakness that threaten to bar humanity from participation in the gladness of the new life. For humanity is made up of Souls, a nation is only a group of souls, and it is only by individual self-conquest that the leaven of brotherhood can enter into the lives of nations. RECORDER

## Soul-Memories

HAS it occurred to many to regard aspirations as *memories*? We cannot aspire after a thing unless it already exists; it does not exist in our present world of action, but it exists elsewhere. Aspiration is the effort to bring things from the potential to the actual. But all ideals exist as ideals before they are realized.

The difference between memory and a prevision is not easily definable. Neither one is in the present; one is in what we call the past, the other in what we call the future. Both exist on some plane outside the ordinary space and time.

When we rise to an intuitive glimpse of what man may become, do we not glimpse what he actually is inwardly?

Life moves in cycles, and there have been times in man's past history when he was more in touch with his own spiritual life than he is now. Some of our aspirations towards perfection may be memories of such a state. The Soul preserves the memories of its own immortal life, though the brain can only store up the records of one incarnation. But the Soul may impress the brain with intuitions which the brain interprets as vague aspirations.

For the thoughtful, life is full of these vague memories, of which poets have sung. Faces suggest ideas which lead us into fathomless depths of introspection in the effort to trace the source of the impression. Landscapes suggest vague memories and seem to bring us to the verge of recollections which ever elude us. This does not necessarily mean that we have seen the faces or landscapes before, but that something in them awakens impressions that the Soul has received before. These impressions we cannot fix, because the memories lie stored in a region inaccessible to the ordinary mind.

If people would accept even on hypothesis the doctrine of pre-existence, they should soon begin to find evidences of it; for it is mainly our mental attitude which shuts us out from the gleams of light. It is also the vanity of people that hinders them; for instead of being satisfied with the knowledge that they have lived before, people want to be reincarnations of John the Baptist and Mary Stuart. If we could regard the subject seriously and without this silly vanity, we might indeed be in the way to learn something, for then the soul's great barrier to the re-awakening of the soul-memory would be overcome. STUDENT

### Theosophy and the Moral Code

THE following clipping will prove of interest to members of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY who are watching the growth and influence of the Society as a morally uplifting factor in modern life:

SAN DIEGO'S MORALITY IS ABOVE AVERAGE  
SUCH IS SHOWN IN STATISTICS COMPILED BY POLICE  
DEPARTMENT

That San Diego's morality is higher than that of the average American city is borne out by statistics recently compiled by the police department, which show the number of disreputable houses and people to be one-tenth of the number found in the average American city of between forty and fifty thousand inhabitants. The percentage is figured out on the basis of Detroit's morality, which is taken as an average American city in this respect. San Diego's report will be contained in a book known as *Social Evils in American Cities*, which is soon to be published, and in which San Diego will rank unusually high.—*San Diego Evening Tribune*, June 12.

This seems an unusual state of things when it is remembered that San Diego is a busy port of call for all sorts of vessels from the stately battleship to the humble Portuguese fishing-smack, and that port towns are not famous as a rule for a high state of morality. The question naturally arises why the conditions of public decency should be so considerably above the average in San Diego when compared with other towns of its size.

There are certainly not more churches here in proportion; and with respect to their activity there is nothing to suggest that it is greater here than elsewhere, even on the assumption—which we do not admit—that a high church membership means a higher state of public honor. As a matter of fact, the ascertained statistics are said to show that not quite ten per cent of the population of the city—now presumably between 40 and 50,000—attend the churches. The police force is small, and the city has not adopted the prohibition of alcohol.

Again, that there is something unique in the civic life of San Diego for which the city may be justly proud, was proved recently by the report of the sailors of the British warship *H. M. S. Shearwater*, who told the students at the International Theosophical Headquarters, when visiting the grounds at Point Loma, that this port was the one they preferred to all others, including those in British Columbia, because of the greater courtesy with which they were treated by the people!

Now there must be some cause for these singular facts, and even if we cannot be absolutely certain of it we may venture a suggestion which is perhaps not too wide of the mark.

Theosophy and its uplifting teachings have been prominently brought before the people of this city for over twenty years. Three branches of the Society were established, one the "Point Loma" (!) in 1888, and the others a little later, by persons who had the higher interest of the city in their hearts and who included such citizens of influence and public responsibility as Colonel Blackmer, who passed away recently, a leading Freemason and a staunch supporter of Katherine Tingley and Theosophy to the last. Then ever since 1897, when the corner stone of the School of Antiquity at Point Loma was laid, Katherine Tingley in addition to her world-wide Inter-

national work, has been striving ceaselessly, both personally and through the efforts of her students and the members of the Society resident in the city, to help in purifying the atmosphere of San Diego upon the highest lines of universal brotherhood, which includes a pure morality as its first and indispensable factor. Regular free weekly addresses of an inspiring and informing character upon crucial subjects affecting human life, accompanied by noble music—itsself an elevating influence of no mean order—have been given by Katherine Tingley and her students at the Isis Theater to large and attentive audiences for nearly eight years; a beginning has been made in the presentation of clean, wholesome dramatic representations; and three Raja Yoga Day Schools, in which the children get the highest moral teaching, have been flourishing under the care of the Theosophical organization, taught exclusively by members from Point Loma, for several years. All this is exclusive of the local and International work being done at the headquarters at Point Loma.

### Marine Signalling by Sound-Waves

BESIDES the experiments in communication by Hertzian waves, devices have been invented for communicating by sound-waves. Though this can be done to a considerable extent with the human ear as receiver, sound being so much more transmissible through water than through air, the idea is to construct an apparatus more sensitive as well as more watchful than the ear. Another point is to render the apparatus susceptible only to the waves which it is designed to perceive, and not to any others.

The receiver consists of a delicate reed fixed at both ends. To the center, where is the greatest amplitude of vibration, is fixed a carbon pencil so light as not to check the vibration. The vibrations of the reed cause this carbon to vary its distance from another carbon pencil, and thus is established a fluctuating resistance in an electric circuit. When the resistance reaches a certain fixed intensity it will, by an electro-magnetic device, close a relay circuit and thus set in motion the indicator—a bell or whatever it may be. Thus the operator at the receiving station gets a signal, and a succession of such signals can, by means of a pre-established code, convey a message.

The problem is to make the vibrating reed answer only to the impulses sent from the transmitting station. To effect this, it is tuned to a certain musical note; and the apparatus may be rendered still more exclusive by making it consist of a number of such reeds, each answering to a particular note, so that the signal can not come off unless all these notes are produced—either at once or successively, according to the arrangement of the apparatus. In the former case we may imagine a group of transmitters endeavoring to sing a chord in perfect tune; and in the latter, while one man would suffice, he would have to be able to yell a tune through a megaphone without ever getting flat.

This reminds one of old stories of magicians who moved mountains and did other feats by the power of song; and the spectacle of a man trying to sing a distant ship from out of

the path of a sunken rock or submarine mine is interesting. Perhaps he would fail and have to send for Caruso, or perhaps they would find it better to use a gramophone.

It is most interesting to note how we are approximating, by the aid of complicated apparatus, to certain power which the ancients are said to have been able to use without apparatus. But the path of progress goes in curves which tend to come back to the same point; and so we have already discarded our telegraphic wire. We have gone from the lyre, through the various mechanical string-striking machines, to the automatic piano-players; and lately someone has invented an electric organ that makes orchestral music out of the ether without any musical instruments at all. Tomorrow someone may find out how to do without the electricity also, and then we shall have music without any apparatus at all. We shall cook our food by fireless heat, and read our books by pure light without any illuminant. Or perhaps we shall be able to get our knowledge without reading at all, and thus eliminate the whole vast paraphernalia of literature and printing, and nourish our bodies by gazing at a corn-field.

There is more apparatus already in nature than we can construct by taking Nature to pieces and putting it together differently. E.

### North Pole on the Rampage Again!

THE statement, given on the authority of an explorer in Alaska, that the North Pole is shifting, appears to be going all over the world, judging from the number of times one encounters it. The last time is in an Indian paper. The change is said to be of such magnitude as to alter the climate and necessitate the re-marking of those territorial boundaries which are fixed by latitude. One hesitates to criticize statements authenticated by the diffusion of such a quantity of printer's ink; but it does seem as if the latitude could not change in Alaska without also changing at Greenwich and Washington; otherwise the earth would crumple. And we have not observed any great perturbation on the part of the official astronomers yet. Then why go to Alaska to find out whether the Pole is shifting, when you could do it just as well in your backyard? T.

### Incandescent Lamp Without a Vacuum

AN incandescent lamp has been invented which will work in air at ordinary pressure and requires no vacuum like the ordinary lamps. This will make it valuable in places where there is jarring, as at sea. The filament consists of a material called "helion" which seems to be largely silicon oxide and silicon nitride, both very stable and having a much longer life than the carbon filament. The resistance is also much higher, so that the filaments can be made thicker, and moreover fitted in several parallel threads, thus increasing the candle power and providing against fracture of any one thread. T.

CONSIDER the significance of silence: it is boundless, never by meditating to be exhausted; unspeakably profitable to thee! Cease that chaotic hubbub, wherein thy own soul runs to waste, to confused suicidal dislocation and stupor; out of silence comes thy strength. "Speech is silvern. Silence is golden. Speech is human. Silence is divine."—*Carlyle*

## Art Music Literature and the Drama

### Mr. Joseph Fussell—Lomaland's Oldest Student

**M**R. JOSEPH FUSSELL, SR., the oldest Student in Lomaland—for although he passed the allotted three-score years and ten more than two decades ago, he insists that he is still a Student—completed his ninetieth year on June 10th last. He was born in Birmingham, England, in 1818, but when two years of age his father and family removed to London and from that time for many years London was his home.

Both his father and grandfather were artists and it was to this profession that he was educated. His artistic gifts ripened very early and at the age of eleven he was earning more than the expenses of his own tuition by teaching drawing in the school, at times having as many as fifty pupils in his classes.

The boyhood days of Mr. Fussell were spent amidst unusually favoring circumstances, for at his father's house noted artists were frequently entertained and to know them, receive their criticisms upon his own efforts, and hear them converse upon that best-loved theme of all, art, was in itself a liberal education. A frequent visitor was the elder George Cruikshank, the celebrated caricaturist. It was during his early youth, also, that our Comrade met the great Turner, immortalized by Ruskin in one way and by the priceless bequest of his incomparable works, in another.

A portrait of Mr. Fussell when a boy of eight years now hangs in the Birmingham Art Museum. It was painted by Edward Coleman, celebrated for his portraits, and who was Mr. Fussell's lifelong friend. Indeed, the latter's pathway was eased and brightened by many of the famous men of the time. It was the famous William Etty, R. A., another great friend of his father and a frequent visitor at his home who, in 1830, gave him a letter of introduction as a student to the Royal Academy.

Among his own intimate friends were Richard Redgrave, Edward Cope and Mr. Herbert, all Royal Academicians, and Joseph Goodyear, one of the most accomplished of English copper-plate engravers. Mr. Fussell now has in Lomaland among his large and valuable collection of wood engravings and etchings, a large number of "artist's proof" engravings by Goodyear which the latter presented to him. It is interesting to know that during many years Mr. Fussell was largely occupied with engraving also and produced some notable plates.

Mr. Fussell and his older brother Alexander—who is yet living, by the way, at the age of ninety-four—were two of the first artists engaged on the *Illustrated London News*, and during the years of his work upon this paper Mr. Joseph Fussell did considerable book-illustrating.

When about thirty-five years of age he and another brother, Mr. Fred Fussell, went to Nottingham to reside, the latter having been appointed Headmaster of the Nottingham School of Art, and Mr. Joseph Fussell, Assistant. Later he confined his teaching

work to private pupils, finding in private class-work greater freedom and opportunity to carry out his ideals which were always of the soundest. While he painted and frequently exhibited for many years—chiefly in water colors—the great delight of his life was in his teaching, and a constant stream of pupils left almost no time for anything else.

In 1903, after the death of his wife, with whom he had maintained a most beautiful and ideal comradeship for nearly half a century, Mr. Fussell, in response to an invitation from Katherine Tingley, came to Lomaland to reside permanently with his son, Joseph H.

cactus in profuse bloom said that few metropolitan "flower shows" could have exhibited anything more remarkable.

From his early youth Mr. Fussell has always loved flowers and has taken what time he could from the duties of a busy life to spend in their care. It is doubtless largely to this interest, which has served as a relaxation and a means of keeping him more or less out of doors, that he owes the health and vigor of the present years. Add to this his warm interest in others, his never-failing helpfulness, particularly towards the young, his love for little children and his love of reading—

Lomaland Photo. and Engraving Dept.

MR. JOSEPH FUSSELL CARING FOR HIS FLOWERS—AT THE DOORWAY OF HIS LOMALAND TENT-BUNGALOW

Fussell, so well known to members throughout the world as Secretary first to Mr. Judge and then to the present Leader. He still works at his beloved art, although no longer continuously, and many of the most beautiful and fleeting aspects of Point Loma landscape and sea-view have been wonderfully translated by his facile and sympathetic brush.

As young in heart as ever, Mr. Fussell is a great lover of flowers and spends many hours daily in caring for them. He is an expert on the care and proper growing of certain varieties that do not always respond even in presumably skilful hands and which are likely to become obstreperous or discontented or both in the hands of the unskilful, among them the chrysanthemum, fuchsia, cactus, and dwarf hydrangea. The amount of bloom that this Comrade can coax out of an apparently insignificant little green plant in a pot is simply unbelievable. Those who saw one of his blossoming hydrangeas last winter, and later an unusually delicate variety of

for he is a devoted student of Theosophy not alone in its practical aspect but by means of its literature—and you have a recipe that will thoroughly frighten away old age and all the *malaise* and melancholy that so often go with it. He often says he is "good for another ten years at least" but we who know and love him think that twenty would be a more conservative estimate.

What a life his has been! What a panorama must pass before his vision when he looks backwards over sixty, seventy, eighty, even eighty-five years. London was by no means the London of today. Islington was meadow land, all about St. Pancras and King's Cross Stations were fields. There was no steam then, nor electricity—nor high finance. Many of the things that constitute the drawbacks and disadvantages of modern society were then undreamed of. And from London to Lomaland—what a step! We cannot wonder that optimism shines out of the face of this beloved and venerated Comrade. H. H.

In ancient days words were not needed. Teacher and disciples understood the Law and in silence worked in harmony with it.—Katherine Tingley

THE last words of the fourfold injunction invisibly written over that mystic doorway through which the seeker must pass ere he find knowledge and peace are these: *and to keep silence.*

There is a silence of lip and tongue, of which the buzzing world knows little enough, but certain types may possess all that and yet be continually slipping backwards. Ambition and a strong will can accomplish, have accomplished, more than that.

There is the silence of the grosser passions, but this, too, may be achieved by one who is firmly planted on the left-hand path, as occult history proves.

There is a silence of mind which is nearer the real thing, but yet is not that golden silence that comes when the personality is actually lost sight of. And the latter is never born except from a deep, unselfish love for others, an actual realization of the inner bond uniting all, a state of being which makes it easier to endure injustice for a millennium than to do injustice even for an hour. That is the real silence and it is of the heart, not of the mind, nor the will, nor emotions.

H. P. B. pointed out in the beginning the old old mystic truth that the Path was "for sinners, not saints," that is, for those who, though possessing faults, yet are struggling towards perfection. The very word, "Student," implies that the end of knowledge and self-effort has not been reached. And true students of Theosophy know that they all have much to learn about their own natures and the natures of others.

However, there is one "disease," so to speak, that is amazingly potent to keep all gateways closed and barred and it is what might be called a mania for self-justification. How it sets one a-suffering—and one's brain a-whirling! Let one's motives be questioned or suspected, let some half-truth (more damning often than a whole lie) be maliciously set afloat, and the one with this mania will drop

## The Higher Silence

his duties, tip over everything within reach and nearly unhinge his mind in the effort to justify himself. It never would do, you know, "for me to be misunderstood"! This is the picture of an extreme case, of course, but there are many stages or degrees, and perhaps no Student escapes the bacillus entirely.

TO the Disciple each Fellow-Disciple becomes a Brother or Sister, a portion of himself, for his interests and aspirations are interwoven with theirs, his progress helped or hindered by their intelligence, morality and behavior through the intimacy brought about by their co-discipleship.

... Gold in the crucible is he who stands the melting heat of trial and lets only the dross be burnt out of his heart; accused by Karmic action will find himself he who throws dross into the melting pot of discipleship for the debasement of his fellow-pupil. As the members to the body, so are disciples to each other, and to the Head and Heart which teach and nourish them with the life-stream of Truth.—From an ancient Book of Discipline

From the worldly standpoint there is every excuse and justification for such conduct. If I am slandered then why is it not clearly my duty to justify myself, providing I can do so by merely speaking the truth, by merely uncovering the motives of the slanderer? But from the standpoint of the teachings of Theosophy there is no such excuse. W. Q. Judge, in private instructions issued some years before his death, and which cannot be quoted here, made this very plain. In an ancient Eastern Book of Rules, known only to Students of Theosophy and to but a part of these, it is written: "Behold the Truth before you: a clean life, an open mind, a pure heart, an eager intellect, an unveiled spiritual perception, a brotherliness for one's co-disciple:...

a courageous endurance of personal injustice . . . these are the golden steps up which the learner may climb to the Temple of Divine Wisdom."

In a letter written to H. P. B. by one of her Teachers (in answer to one in which she had asked him to advise her as to her attitude towards a certain person who was outrageously slandering her, and thereby threatening to ruin the whole Society) we read these significant words: "You are personally threatened . . . your two Karmas (this enemy's and H. P. B.'s) run in two opposite directions. Shall you, out of abject fear of that which may come, blend the two, and become as she is?" And in quoting this in a private writing H. P. B. adds: "Since then I have acted more than ever on this principle of trying to help everyone *irrespective of what I personally may have to suffer for it.*" And what has been the example of Katherine Tingley? Never yet has she lifted voice or pen in defense of herself, only in defense of the Theosophical Movement and its concrete expression on Loma Hill. He who runs may read. Students should understand without commentary.

The sincere Student early finds that to take a different course ("in abject fear of that which may come" if I should be misunderstood (!) you know) will not only make it impossible for the Teacher to help him but will positively undo the results of previous help. And besides, there is the common sense view of it. Who expects to conquer the violin without practice—and practice not on a silken cushion but on the violin itself, harsh and unmusical as it always is in unskilled hands? How then are we going to learn the "Virtues of Perfection" without anything to practise on? What idiocy to expect to be able to learn forgiveness without ever anything to forgive! Or brotherliness without some knowledge of its opposite. Or "calmness under all trials" if nothing ever occurs that makes calmness

mean effort. Or virtue, without the chance to withstand the siege of passions within and temptations without. Or justice, if we are never permitted to know anything about its opposite. Or the majesty of the Higher Silence, if we meet with no temptations to "explain ourselves" in talk.

Ay—the majesty of the Law! The one who wrongs a brother has that within his nature, which, if not burned out by suffering, means nothing more nor less than failure on his part. He will suffer enough. Why should the one wronged add any weight to the Karma that will be heavy, too heavy, perhaps—"and become as he is," in addition? Let it go, let it go. Life is too short, time too precious, to be spent in running to the Leader to convince her that you are perfect—even if you are. She knows you much better than you know yourself and perhaps it is only because she has won the twin pearls of the Higher Silence and Compassion that she does not break your heart and break your spirit by *letting you know the truth*. None of us can bear much, and most of us very little.

Are you being misunderstood—slandered? Really! Then by all means complete the work of destroying yourself by worry and feelings of revenge! Is not such a course logical? What wonder that Theosophy, which condemns such an absurd course, is but another word for common sense!

Those who pass the gateway of the Higher Silence are never the same thereafter, nor can they ever again step backwards into the same old place. This door swings inward only. Those who have not passed it have no way of guessing who has or who has not found the strength to lift its heavy bar. Those who have passed through know all others who have—and are recognized by none other. What joy in life to *know* the Law, to feel its every pulsing beat, its every ebb and flow, to see its working as some great conscious Divine Power of Love in the little, *little*, usually unnoticed, occurrences in our own and our fellow-workers' lives! What peace to him who has the power to go steadily on, regardless of everything but his duty, serenely confident that there exists no power on earth, in heaven or in hell, strong enough to prevent his fulfilling it, if to fulfil it he is determined! And there are such, great brave Souls who pass quietly on through their duties unmoved, who would die at the stake with sealed lips rather than utter a word that would cast a reflection upon a brother, even though that word be a true one, even though that brother be wickedly crucifying them. And yet it is the easy way, the "way of least resistance" to quote the Leader's oft-used words, the only way that doesn't leave "that guilty feeling" in its trail. It is the only way that the rightly courageous and absolutely sincere Student will ever consent to follow, once he has found it, once he has tasted the sweetness of that spirit of sacrifice which placeth one's brother before oneself. H. H.

### Letter From an English Comrade

*Where Three Empires Meet*, by E. F. Knight, and *A Diplomatist's Wife in Japan—Letters from Home to Home*, by Mrs. Hugh Fraser.

THE two books dipped into and taken together appear to open out a way through which a peaceful understanding between the nations can be arrived at and ancient knowledge, of great future benefit to humanity, shared. The spot, the Pamirs, indicated in Central Asia, has also been written of as the "Roof of the World." Was the author thinking of mountains that tower into the sky or of aspirations that conduct to a life of finer, more ethereal existence?

The three empires are China, Russia, and England (Kashmir)—East, North and West.

A DAUGHTER OF IRELAND

England, representing most of the peoples speaking her language, is indissolubly linked to that other Island Empire so beautifully described by Mrs. Hugh Fraser. She is linked also to Italy, while her near neighbors, France, Greece, and Sweden, draw her towards Russia, as Japan draws her towards China. Russia's interesting empire, with that great, almost unbroken expanse of Siberia, may hold surprises and treasures as great as those that China can unfold, and will, at her leisure. Under favoring conditions the Yellow Race might well supply the action and alertness of intelligence needed to awaken all the old, Eastern races, while Chinese balance, or love of the "path of the mean,"—the middle way—would be a boon to numerous modern peoples who now consider themselves more advanced. China has a source of inspiration, shown through her philosophical pre-

cepts and maxims, that these newer races are just beginning to touch through Theosophy.

As one book recites, the experience and journey of the Soul of man is set forth every year in Ladak, at the Himis Festival or Fair; and in the so-called "Devil's Dance" of two days' duration, the spirits of evil to be encountered are symbolized by hideous masked figures, with intervals when Buddhas appear on the scene as protectors and helpers. Written in 1891, it is hoped that the author has by this time encountered in Theosophy the great unifier of all religions. All the world may read now, for knowing that humanity was in danger of losing the full practical meaning of the teachings of H. P. Blavatsky and W. Q. Judge, Katherine Tingley has brought them out and emphasized them before the eyes of all humanity. Let me close by quoting a bit of verse from *A Diplomatist's Wife in Japan*:

Two babes the mother bore at one rich birth,  
Twin hearts that beat to her low notes of love,  
Twin souls that leapt to each heroic call,  
As generous sword to snatch the Treasure-Trove  
Of hard-won honour. And our Mother Earth,  
Rocking the twain in the deep rise and fall  
Of her green bosom, sang proud litanies,  
Promised them beauty, conquest, empire, brain and heart,  
And woman's faith, and towering pride of race.  
Too great to rule together, worlds apart  
She set them, in the silver of the seas.  
Yet heart calls heart, as erst upon the breast  
That bore these glories, sovereign in their place,  
The Island Empires of the East and West.  
FANNY JANET BUSHBY  
On board R. M. S. *Adriatic*.

### Jottings and Doings

(From a Student's Note Book)

THE extremely large hat which milliners are now persuading a great many women to wear, threatens to become a factor in the problem of religion. Note the following:

THE DUNKARD BONNETS TO GO?  
MANY GIRLS IN THE CHURCH PREFER THE HATS WITH FLOWERS

DES MOINES, IA., June 8.—Unless men high in the councils of the German Baptist brethren are mistaken, a break is threatened in the conference now in progress at the fair grounds. While there are objections to several of the ironclad rules of the sect, the attention of the church and the chief discussion will center in the inclination of the girls to forsake the conventional bonnet which the Dunkard women are required to wear, for the more ornate hat of the lay woman.

The elders do not admit that the discussion threatens the peace of the conference. But they do admit that church heads in certain Ohio communities, who have relaxed their supervision of the girls in their charge, may be reprimanded. It is said that formal charges may be preferred against two churches in Ohio that may end in their withdrawal from the mother church or in their expulsion unless their pledge is given to carry out the laws of the organization to the letter.—*Kansas City Star*

Again doth fashion quarrel loud with creed!

# OUR YOUNG FOLK

## Glass Making

A GREAT many boys and girls in big cities are employed in glass factories. While with girls it is more often but a temporary means of earning a living, boys usually undertake it with a view to learning the business as their life-work. The training received at this work resembles Rāja Yoga in one respect, for to keep his place as a glass-blower's assistant a boy must learn first of all to pay the closest attention and to do his work not just "well enough," but *exactly right*. He must have a real interest in the work and determination to make it a success. At the start he is given to understand that only patience and long practice can develop skill at this art, which requires absolute accuracy and great dexterity. He knows, though, when once it is mastered he can take his place as peer among craftsmen.

The manufacture of glass is one of the oldest and most beautiful of the arts. Just when it commenced is not known, for as far back as history carries us not only is there evidence that glass existed, but that it was developed by the ancients to greater perfection than anything we have at the present day.

The Phoenicians claimed to be the inventors, and the legend runs that when certain of their merchants were returning home in a ship laden with natron, or soda, a storm drove them upon a sandy beach. They supported their cooking-pots on large lumps of the soda and built a fire. The heat dissolved soda and sand into a transparent substance and thus revealed to them the composition of glass. It has been found, however, that long before this period the Egyptians were expert at the art. They knew how to cut, grind and engrave it, and the tints of their stained glass, pieces of which are found among the most ancient ruins, are a marvel to this day. The Egyptians were the first to imitate precious stones in glass, and did so with a perfection far beyond anything attained in later times. We are told that these wonderful people had the secret of true malleable glass, which has since become a "lost art." They must also have made an unbreakable glass, for the story is told as a historic fact that a glass cup brought to Rome in the reign of Tiberius was dashed upon the marble pavement without being crushed or broken and the slight dent made in it by the fall was effaced with a hammer. It is stated that the Romans of the imperial period used glass more extensively and for more purposes than we do at the present time, and in some respects their productions excelled ours. Aside from the use of glass for domestic purposes, for decoration and for optical instruments, it was used in pavements

## A WET SHEET AND A FLOWING SEA

Allan Cunningham

A WET sheet and a flowing sea,  
A wind that follows fast,  
And fills the white and rustling sail,  
And bends the gallant mast;  
And bends the gallant mast, my boys,  
While, like the eagle free,  
Away the good ship flies, and leaves  
Old England on the lee.

Oh for a soft and gentle wind!  
I heard a fair one cry;  
But give to me the snoring breeze,  
And white waves heaving high;  
And white waves heaving high, my boys,  
The good ship tight and free—  
The world of waters is our home,  
And merry men are we.

There's tempest in yon horned moon,  
And lightning in yon cloud;  
And hark the music, mariners,  
The wind is piping loud;  
The wind is piping loud, my boys,  
The lightning flashing free,—  
While the hollow oak our palace is,  
Our heritage the sea.

and also in thin plates as a coating for walls.

Twentieth century glass manufacture has reached a high point of perfection. Each year extends its usefulness and records triumphs of art in beauty of design and coloring, placing us nearer the height attained in this line by civilizations which flourished before our history even begins. STUDENT

THE laws of the northern Europeans were usually committed to memory, and so were passed on orally. To make them easy to remember, they were put in verse form by the Skalds who played such an important part among the forest folk. Many of the alliterative phrases from the ancient laws have remained in the memory of people. Such expressions as: through thick and thin; in wind and weather; highways and byways; frank and free; heart and hand—are of this class.

## Grover Cleveland

GROVER CLEVELAND, the twenty-second President of the United States, who held office from 1885 to 1889 and again between 1893 and 1897, and who died in New Jersey on June 24, began life as the son of a poor clergyman. He wished to study law, but before he was able to do this he had to make his way by working at anything he could find to do. When at last his opportunity came and he got employment in a law firm, he one day got a copy of Blackstone and became so much interested in reading it that he was locked in the office over night. In the morning when the office was opened Grover was found still reading, so glad was he to have a chance to study the stand-

ard work on the subject most interesting to him. Grover Cleveland as a man had great moral courage. No mere party consideration could lead him to act contrary to his own convictions. The possibility of defeat in an election did not move him if he had made up his mind as to what was right. Of course this made people with motives of self-interest turn against him. But he was firm and fearless. One of his fellow-workers once said, "I love Grover Cleveland for the enemies he has made." Mr. Cleveland coined certain maxims which express his ideas of the responsibilities of those holding office in the State. One is, "Public office is a public trust"; and another is, "Public officers are the servants of the people." These ideas Mr. Cleveland himself faithfully put into practice. STUDENT

## Facts Worth Knowing

THE British Museum has a curious collection of books. They consist not only of paper and leather, but are also written on bones and stones, tiles and bricks, and even oyster shells. Some of the manuscripts are on bark and leaves, as well as on papyrus, ivory and various metals.

It is only a hundred years since envelopes were invented, and not much more than fifty since they began to be used generally. Before that time the paper on which the letter was written served also as an envelope, being folded in two, then in three, and having the address written on one of the sides.

AUTHORITY has been granted to the central junta of forests in the Republic of Mexico to carry out a system of reforestation throughout the country. The president of the junta recently returned from Europe where he studied the best methods of restoring the forests, finding the most valuable suggestions in Switzerland. The work of the junta has been begun by the establishment of a nursery for young trees in a suburb of the capital.

# THE CHILDREN'S HOUR

## Bees

How doth the little busy bee  
Improve each shining hour  
In gathering honey all the day  
From every opening flower.

SO runs the old song, but bees do so much more than simply gathering honey all day, that the lines tell us very little about the busy creatures.

It is surprising to find such a well-ordered government as that of the bee colonies. The queen bee is the ruler of the hive and is also the mother of all the other bees. She generally lives about four years. The drones are large bees with no stings. They do no work in the hives. The bees we see most frequently are the worker bees. They make the comb, gather the honey and store it away for food for the family during winter; and they gather also the pollen which they make into a kind of bread to feed the baby bees. Some of these worker bees keep the hive in order and give food to the baby bees, while others wait upon the queen bee; so you see it is no wonder that they always seem to be in a great hurry.

The workers know how to build the cells in the comb exactly the right size for each of the different kinds of bees, large cells for the queen, a smaller size for the drones, and a still smaller size for themselves. These cells are all six-sided and fit so perfectly together that there is no room wasted.

They know that they must feed the egg that hatches in the largest cell "royal jelly," so that they may raise a new queen bee when the old queen begins to grow feeble; and that the drone cells need special care in building; and that the baby worker bees need only ordinary food.

Where do you suppose they get all the wax to build the comb with? It comes out of their own bodies in slender strips between the rings that form the joints. The bees take these strips of wax in their mandibles or jaws and, bit by bit, build the delicate and beautiful comb. Sometimes the wax strips come loose before the bee reaches the hive, but it knows how to pick up the wax, tuck it under its chin and fly home to place it in the comb just where it is needed most. A worker bee has little pockets in its hind legs, and it has a way of scraping the pollen from its tongue with the forefeet and then with its next set of feet packing these pockets or baskets so full that sometimes it can scarcely fly because of the weight of the pollen sticking out in yellow bunches at its sides.

When a young bee first begins to work and comes home with its little pockets full of pollen it will move about the hive as if it were saying, "See me with my pockets full. I am a happy little worker now." Six or eight weeks is the length of the worker bee's life. At the end of that time the little wings wear out, and the bee crawls out of the hive to die, so as not to be in the way of the younger ones.

A lover of bees once said: "Bees are the pleasantest, most sociable, genial and good-natured little fellows one meets in all animated

Lomaland Photo. and Engraving Dept.

## YOUR BUSY FRIENDS, THE WORKER BEES

creation, when one understands them." It is seldom that they use their sharp weapons, their stings, except in self-defense. It is a fact that bees were always kept about the temples in ancient times. And in Lomaland where the temple life is being lived again, there are many bees. One of the students who is a great friend of the bees told me of a pretty custom they have. When the queen bee has entered the new hive, and the rest of the bees are flying around or are on the ground waiting, some signal is given that the bees understand, and immediately they gather on the ground near the hive, with heads lowered, facing the opening. There in a body, fanning their wings all the time, the bees utter a sound like a joyful greeting — just as if they were singing a song before entering the new home. The same thing happens when a hive has been cleansed of moth millers and their grubs. It shows what pleasure they take in their home.

STUDENT

## How Many Times a Day do You Say 'I'?

TWO little girls once decided to count how many times each of them said the word "I," in one day.

"I know that I must have said it a thousand times," said Hilda, "because even before I started for school in the morning I had said it so often that I got tired of counting."

"The same thing with me," confessed Elsa. "Is it not surprising? Why is it so, I wonder?"

"Let us ask Godmother," suggested Hilda. "It was she who gave us the idea in the first place, do you remember?"

"Yes," said Elsa, "perhaps there is some riddle or joke about it."

The girls told their godmother all about

their experiment, and the result of it, and then asked, "How is it that we say 'I' so many more times than any other word?"

"If you can correctly answer three questions, I will tell you," said she. "First, what comes before words?"

"Thoughts!" answered Elsa and Hilda in one voice.

"Right!" said Godmother. "The second question is: If thoughts are the foundation of words, what then are the words picturing?"

"The thoughts, of course!" answered both girls.

"Right! You have passed the second question also," said Godmother. "The third is: If the word 'I' most often runs over two little girls' lips, what are the two little girls most thinking of?"

A blush sprang up on Elsa's face, and a blush on Hilda's, but they answered not a word.

"Well," said Godmother after a pause, "you have failed to answer the last question, so I will not tell you any more; but if you should find the answer one of these days, you may come and tell me." AEA

FROM Nome on the Behring Sea to Sitka, or to places in Southern Alaska, the distance is as great as between Michigan and Florida. Winter at Nome lasts eight months — with no sun, and there are no trees, no birds to be seen. Imagine the joy of a little four-year-old girl, who was born at Nome and had lived there until last year when she visited the state of Michigan with her mother. She thought it must be heaven where there were trees and flowers and birds and grass. What do you think she would have thought if she had seen Lomaland, children? M. G.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis  
Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

## The Fulness of the Seeming Void

SCIENCE is more and more emphasizing the idea that there is no such thing in the universe as "empty space." People imagine that the universe is composed of solid bodies with "nothing" in between. And this "nothing" they imagine to have dimensions and to extend out in all directions. But it is surely a peculiar kind of "nothing," if it has size and can be measured—so many miles of nothing. The truth is that whatever has extension and measurability must be something, and cannot be nothing. Some centuries ago the air was shown to be a body; in the same way, when air is pumped out, there still remains the mysterious "ether," across which light and electricity can travel. It is not possible to remove the ether from the inside of a vessel. If it were possible, what would happen? The sides of the vessel, having now nothing between them would be in contact; perhaps the vessel would collapse.

So we must give up the idea of the universe as an immense expanse of nothingness, occupied by rolling worlds. Nothingness could not take up so much room, nor would there be room in it for the planets to revolve. The universe is absolutely filled with something. Where we do not perceive anything, we have merely reached the limits of our physical senses. The air appears nothing to the eye, but the skin feels it as wind, and we can weigh it and analyse it. The ether we cannot feel nor see, taste, smell, nor hear; we cannot analyse it nor weigh it. Yet it has the property of existing as a medium or substratum for the material architecture of the universe.

Emptiness is a figment of our senses. And so is what we call fulness. Science shows us how a solid body may soak up liquid without increasing in bulk; how it may then absorb a gas; and how finally it may be charged with electricity. Here are various grades of matter, of differing fineness, occupying the same room. According to the atonic theory, solid matter is a collection of separate atoms with relatively vast interspaces, being in fact strictly comparable to the stellar universe, though on a smaller scale. Now these atoms are far too small to be perceived by any of the physical senses; and, if floating loose, they would constitute a gas or nebula so thin that we might well know nothing of its existence. Through some mysterious faculty we are able to perceive and handle these mysterious group-

ings of atoms which we call matter. But a slight change in our senses, and the whole thing might vanish. Similarly there are in all probability kinds of matter in the universe which we cannot perceive at all, through which we pass without resistance, but which are as solid and real to other beings as our matter is to us. And our matter is absolutely imperceptible to these other beings.

Such a view is by no means opposed to science, is in fact suggested (and even necessitated) by science. And it is the teaching of Theosophy. The whole universe is composed of worlds within worlds, all interpenetrating each other (as it were) and co-existing without confusion.

An alteration in our faculties, and we might find ourselves in an entirely different universe; the atoms which we now see and feel being no longer perceptible, and other groupings of atoms having come into view.

How little we know about the universe! What a paltry idea it is to consider that universe as consisting of nothing but material worlds whirling in "empty space." And even if we say that the space is filled with ether, it is not much better so long as we picture that ether as a mere thin gas. Looked at from the material point of view, the universe seems a never-ending system of revolving globes. The atoms revolve in their tiny orbits and form what we call solid bodies. The planets revolve around the sun and form the solar system. The solar system, in company with countless other solar systems, revolves around some other center and forms a stellar system. The eye shows us in the firmament pale patches of light which we believe to be other stellar systems.

In fact, so long as we continue to regard the universe under the form of matter in space, we shall never get beyond this idea of an infinitely extended magnitude—infinitely vast in one direction, and infinitely small in the other.

But shutting out from the mind all ideas of spatial extension, we can imagine an infinite capacity in other directions. In the world of thoughts and feelings in which we all live there is no space of the kind we have been considering. We pass the greater part of our existence in a world where there are no solid bodies and no extended space. The idea that a thing cannot exist unless it has a definite size and takes up so much room, is a delusion. It is a mistake to suppose that when we have analysed anything down to a point or an atom,

Two Worlds

we have reduced it to nothing. The most important things in life are those which have no size nor dimensions at all.

Owing to our possession of senses, a small portion of the universe comes before us objectively under the form of extended bodies and apparently empty space. All the rest escapes our observation. But, if our senses were to become more developed, we might

be able to perceive objectively many more things than we now perceive.

#### A Different Universe

What is SPACE in reality?

Is it not an infinite capacity to contain? Do material objects with three dimensions fill it? No, they only limit it.

Thus far we have been considering "the fulness of the seeming void" in its physical bearings only. The expression has a deeper significance when applied to our inner life. The objects of sense, the interests and distractions of the mind, the pursuits of pleasure, all seem to fill a world which, without them, would be void. Yet, like the solid bodies in the universe, they are, from a higher point of view, so much emptiness. We cling to them because we lack the sense of that greater fulness that exists in their absence, but which to us *seems* a void. But in the silence that follows the hushing of the sensual attractions of the mind, there can grow a fuller life.

There are ascetic philosophies that teach the vanity of the outer life; but they often neglect to tell us of the fulness of the real life beyond. Hence they are too pessimistic. If we are to give up the delusions of the senses and mind, it is only that we may be thereby enabled to find the realities, which alone are worth having.

STUDENT

#### Hepatoscopy

**D**IVINATION by the liver is not a familiar subject, though the pages of Roman history tell us something about it. It will be a surprise, however, to most people to know what an important part it has played in antiquity.

In *Records of the Past* there recently appeared a synopsis of a book by Professor Jastrow, Jr., on this subject. Though many of the theories of the writer seem very far-fetched to a student of Theosophy, a good deal of interesting information is to be gleaned.

This method of divination had a persistent hold upon a civilization that extended for thousands of years. This fact needs emphasizing; a civilization of such duration is not to be looked down upon. The fact that it endured so long proves that it had the elements of stability; and what that implies concerning the character and attainments of the people may well be matter for serious consideration. Among the tablets from Nineveh we have specimens of omens dating from the days of Sargon (at least 3000 B. C., as conjectured), and going down to the conquest by Cyrus in 539 B. C. The Greek and Roman hepatoscopy rests on the example of the Etruscans; and a model of a liver in bronze, found at Piacenza in 1877, shows the same general characteristics as a clay model found near Bagdad.

But what is still more remarkable;—

Hepatoscopy is found also among people living in primitive conditions, like the natives of Borneo, who to this day, on all important occasions, when the future is to be divined, sacrifice a pig and in-

spect the liver, noting precisely the same phenomena, including the markings of the liver, that attracted the attention of the Babylonian priests.

More remarkable yet is the conclusion drawn from this.

The conclusion to be drawn, therefore, is that liver divination is a primitive rite that survived among highly civilized people like the Babylonians and Etruscans, *because* it was developed into a pseudo-science through the persistent efforts and the ingenuity of the priests.

Obviously the only theory that can account for the preservation of such a practice among a highly civilized people for thousands of years is the theory that the practice was based on sound principles, amply confirmed by experience, and of well-tried efficacy for the desired purpose. Nothing but the foregone determination to reject this obvious explanation could have driven anyone to avow such a theory as the one just quoted. Why should a civilized people adopt or perpetuate this primitive rite? Why should they adopt this particular one out of a host of primitive rites? How could the priests develop it into a pseudo-science and successfully impose it upon everybody from the king downwards throughout twenty-five centuries of high civilization?

But the author gives another reason for its persistence. He says that it rests upon the belief that *the liver is the seat of the soul*. This view, he adds, gave way to the later view that *the seat of life and of the soul is in the heart*. A third stage, he continues, is represented in the "more scientific view which assigned to the brain the most important functions connected with the consciousness of life."

This illustrates how our authorities in science and archaeology are limited by the enforced narrowness of their studies and their lack of a broad philosophical basis or key on which to rest their speculations. For want of a central thread of knowledge, they are unable to string together their ideas. This writer, for instance, shows no sign of knowing that there are several seats of life and mind and soul in the body; yet a very slight acquaintance with (say) Aryan Hindú philosophy would have told him that the heart was regarded as the physical center of one kind of consciousness, the head of another, the abdominal viscera of another, and so on; and a more extended reading would have sufficed to confirm this fact from many other sources.

It is what Theosophists know as *Kāma-Manas* that has its corresponding bodily center in the abdominal organs. Everybody knows the intimate connexion between emotions and the viscera, and the close relation between the lower mind and the state of the liver is proverbial. The ancients simply recognized the fact that the liver has this close connexion with the lower mind. But the heart was regarded as the seat of another mind. Again, the head is in its turn a part of the mechanism of consciousness. There is not the slightest doubt that the ancient Babylonians recognized all this and more; and the notion that they entertained these different ideas at different times is absurd.

It would be easy to elaborate this subject of the consciousness of man and its relation to the various bodily centers, but this is not the place.

The theory of hepatoscopy is explained by

the writer by comparing it with astrology, which, he says, rested on the belief that occurrences on earth were paralleled in the heavens. This is a crude and partial way of stating the belief in the unity of all life and in the interdependence of all natural phenomena. On this knowledge rests the whole science of divination in general. That science is but an extension of the science by which we read the signs of the weather in the barometer and thermometer, or assess the value of an insurance policy from a medical inspection. Uninstructed peoples regard our science as magic and our reading of barometers as divination. A more universal and comprehensive science recognizes the unity of *all* nature, not merely the visible and tangible part; and learns to read in the smaller details the signs which affect the larger plan.

Thus the human character (and hence the destiny) *could* be read from the hands, the the head, the writing—a variety of different indications. Again it is impossible to go into details here, and it must suffice to say that reading the signs in the liver of a slaughtered animal was one case of applying the knowledge that all natural phenomena are intimately connected.

The writer gives illustrations of models of livers, with the surface mapped out into areas and marked with figures, and of Babylonian brick inscriptions with delineations of the omens, which have been found in the ruins. The science was very elaborate, depending on the shape of the liver and all its attachments, the color and general appearance, the markings of its surface, etc., etc.

One word as to the attitude of Theosophists towards divination. Theosophists are strongly of opinion that all kinds of divination—phrenology, palmistry, astrology, or what not—are a serious waste of time and mentality *for the people of today*. Invariably they but minister to idle curiosity or the desire to obtain personal information. Pursued with such motives, and with the habitual haste and superficiality of modern methods, they inevitably side-track the student of life and lead him off into unprofitable channels. The students of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, with their interest centered on the great problems that affect human life in general, have little use for such scraps of odd information as may be gleaned from these byways of study. Without a wish to poke into the future, either of themselves or anyone else, they rely on an age-old philosophy and upon the merits of duty performed in the present; and the study of the signs of human nature as revealed in daily life more than fills their hours.

So much for divination today. With the divination of the past we have no immediate practical concern. But it can be understood that guarded by a sacred college, and kept from the profanation of vulgar use, divination might well have held a higher place than it would do if practised today. All sciences, however fallen from their high estate, have a true and legitimate use.

# Some Views on XXth Century Problems

## Unpracticalized Philosophy

WHAT does modern philosophy propose to do about its own conclusions? There is a modern philosophy, spinning about its comparatively simple idealistic nucleus an ever growing and already vast web of words.

Philosophies of every kind and color there are of course on the market. At one end they are purely materialistic; perhaps about half way along would be Herbert Spencer's school and its variants; at the other they are purely idealistic. It is at this other end that multiplication and cell-division is chiefly going on; here are the marks of vitality; the middle and the materialistic end are of the Nineteenth century; *this* is of the Twentieth.

This end has a philosophy by which it would be possible to live and grow, which could be simplified and made practical, which even presents conclusions that might be made sublime if translated into conduct. But he who would do so must first escape from the sea of words, resist the temptation to pass from one system to another differing by a shade—yet a shade that requires two volumes to manifest itself. He must tether his mind. At some early point in his reading he must ask himself: Well now, what am I going to do about it? What are the full implications of this fascinating conclusion? He must get them for himself; he will not find them in the volumes.

Here, for example, from Professor Royce, is what might perhaps be called the nucleus for practical purposes of the idealistic doctrine. In a lecture on "Implications of Self-Consciousness" he says:

Idealism of the post-Kantian type is distinguished by two especially noteworthy features. It first involves a criticism of the inner nature of finite self-consciousness. I, the finite thinker, it says, must be in far more organic and deep and wide relations to my own true selfhood than my ordinary consciousness easily makes clear to me. In essence, then, I am much more of a self than my immediate consciousness, as it exists under human limitations, ever lets me directly know. . . .

The idealistic view here is, that if on the one hand the self of finite consciousness is in any case, by implication, far more than it can directly know itself to be, on the other hand this self, in order to be in true relation to the outer objects which it actually thinks about, must be, by implication, so related to those outer objects that they are in reality, although external to this finite self, still not external to the true and complete Self of which this finite self is an organic part.

Then he speaks of the true Self as knowing my world of objects not only in the limited way in which I know them but also "their inner essence." This Self is God, "the world-possessor," "the one complete Self." This is good Vedānta.

Surely there is already here, without reading any further, the essential of a religion and guide. Each of us finite selves is in immediate relation with one great and all-containing Self. Evolution consists in opening up our consciousness to this greater consciousness about us.

These philosophies have found a golden

key; it fits that splendid door, they say. And then they go on to describe the key and the door and the perfection of the fit—volume after volume of it! One would imagine the practical reader would lay the books down at once, *put the key in the door* and open it. *Thought* has gone as far as it will; now is the time to make consciousness feel and *know* that over-presence of a greater consciousness.

Putting the key in the door also means the feeling and practice of brotherhood. For every other man must also be a partial incarnation of that great Self; it can only be fully known through an utterly sympathetic relationship with all of them. They are of one inner essence, the Divine essence, and each must reflect and respond to all the rest if it will near itself to the great Self. STUDENT

## New Ways With the Criminal

RECENTLY published criminal statistics for England, officially verified, show a total decline in indictable offenses since 1857, of nearly one half: more accurately, forty per cent. The total number of persons tried in 1906 was 59,000; in 1857 it was nearly 55,000. But the population has increased from 19 millions to 34 millions. In the main the reduction is in thefts, excluding burglary. Burglary indictments have increased with the population, but the commissioners attribute this in part to the shorter sentences now in vogue, enabling the same man to appear oftener. Crimes against the person—*of others*—are not increasing, but suicide is.

On the whole the picture is very gratifying and it remains to determine the cause of the betterment so as to make it do more work. The field is open for anyone to have his say and advance his plan. But those of the sayers who wish to speak to the point must not indicate as a cause anything—for example education or religion—equally operative in countries where the crime list is *not* diminishing. While the discussion pursues its facile way, it might be a good idea to make alcohol more and more difficult to get. Those who are not joining in it for the unusual reason that they do not think themselves possessed of data enough to form an opinion, might study what Theosophy has to say about the child nature, and how it has applied its views in the system of education called by Katherine Tingley "Rāja Yoga."

A Chicago judge has been practising with much success, apparently extraordinary success, a method for humanizing and reforming the criminal, especially the habitual criminal. He imposes the maximum penalty the law permits and then gives the man his liberty, pledged to do better. He can therefore at once seek work, and his wife and family, if he was supporting them, do not starve while he serves out a term. Ninety-two per cent, reports the judge, kept the terms of their pledge, many of them previously drunkards as well as criminals. Each man knows that should he offend again his delayed sentence falls instantly and automatically upon him. There is no trial for the new offense with its

possibilities of acquittal or a trifling punishment. The judge asked for, and obtained, the voluntary services of about 400 gentlemen who agreed to interest themselves in and visit at stated intervals all these men. Thus they felt that an entirely friendly eye was upon them; they were often helped to employment and tided over difficulties; they understood that the law was on their side, was a human thing that wished them no ill.

This judge has the secret—the heart touch without sentimentality. The application of it may have only begun, but it has begun.

STUDENT

## The Real Paul

SIR WILLIAM RAMSAY has been relieving his scientific studies with a survey of the wanderings and teachings of St. Paul and now presents us with a volume on the matter—*Cities of St. Paul*.

Paul, in his view, was more Greek philosopher than Hebrew theologian, though of course familiar with the best thought of the Hebrew prophets. Paul taught from the source of his own religious experience, initiated and illuminated by Greek thought and mysticism. Only by so considering him and reading him apart from common preconception, can we understand what he meant by such terms as The Christ and The Spirit.

Sir William Ramsay thus summarizes what he has found to be the essence of Paul's teaching concerning history: (1) The divine is alone real; all else is transitory or error. (2) A society or nation is progressive in so far as it hears and attends to the divine voice; otherwise it must degenerate. (3) All individuals and all peoples can hear the divine voice, but there must be co-operation on that basis.

Paul's views are thus taken right out of their accustomed settings and shown as his explanation of the rises and extinctions of civilizations and peoples. Sir William has succeeded in the disentanglement for himself. Those who would follow him must do the same, must try to read Paul as if they had never heard a sermon, remembering the while that *Christos* is a Greek term in use long before the time of Jesus, belonging to the religious Mysteries, and meaning *anyone* who had finally triumphed over the lower nature and attained union with his own soul and the soul of the world. Such a one was regarded as a helper or redeemer of men, clearing a path which others might travel with less pain. It was taught that anyone who conquered anything base in himself made easier for others that same conquest. But those others had to go the path, not be carried; had to achieve the conquest, not find it all done for them. Vicarious atonement, as we have it, is a merely theological chicken, perhaps the evillest of its brood. Sir William Ramsay must have our thanks for this perhaps first attempt to rescue Paul from the theologians. There is very much more to do, however, for Paul was not only subtle in his thought, but was guarded in his expression as well. STUDENT

THŪPĀRAMA DĀGOBA, ANURĀDHAPURA, CEYLON

## Thūpārama Dāgoba, Anurādhapura

**T**HIS is the oldest of all the great dāgobas of Anurādhapura and the most venerated dāgoba in Ceylon. It was built by King Devānāmpiya Tissa in B. C. 307 as a shrine for the right collar-bone of the Buddha. Its height is 63 feet and around it are three rows of pillars, 52, 36, and 40 in each row respectively, all the shafts being monoliths.

## Abode of Buddha Explored

**I**N *The Mahā-Bodhi and the United Buddhist World*, Journal of the Mahā-Bodhi Society, Colombo, Ceylon, there is an account of the archaeological excavations at Saranath, four miles from Benares.

It is of interest also in proving that the account of the ancient Chinese travelers is reliable. Modern historians often miss a great deal of valuable knowledge by their poor judgment in estimating the credibility of such witnesses; but archaeology is every day vindicating the ancient historians at the expense of the modern.

In the sixth century, says the account, Gautama, after his enlightenment under the Bodhi-tree at Gāyā, fixed upon Kāśī (Benares) as the center from

which his faith should be preached. He took up his abode in a park known as "Migadāya" or "Deer Park" at Isipatana which is now known as Saranath. For about 800 years this was the headquarters of Buddhism in India. About 300 years after the death of Buddha, Aśoka adopted Buddhism, and erected several stone columns and monasteries at various places made sacred by the Great Teacher; Saranath was the first place from which Nirvāna was preached and the neighborhood was covered with "Vihāras" and "Stūpas" or memorial mounds, built by devotees and kings in various ages.

Hiuen Tsang, the Chinese traveler, who visited India in the seventh century A. D. says that he arrived in Migadāya where there was a residential building built in eight sections within a walled enclosure. There were pavilions for the accommodation of the 1500 disciples who were studying the Hinayāna or "small vehicle" of the Law, the more ancient school of Buddhism. In the midst of the enclosure was a temple. To the southwest of this temple was a stone stūpa built by Aśoka, which had then become partly buried, though still 100 feet high. In front of it Aśoka had placed a memorial column about 70 feet high, polished like a mirror; and there were numerous sacred monuments and

water reservoirs and stūpas built all around it.

The explorations have confirmed this description, thus showing that ancient historians may tell the truth, even if belonging to "heathen" countries and "primitive" times. The Aśoka column described by Hiuen Tsang, a beautiful statue of the Buddha preaching, ruins of several buildings, miniature votive shrines, and many other objects of interest, have been unearthed.

The excavations are still in progress and are revealing other buildings as also jewels, vessels, etc. They are giving employment to hundreds of famine-stricken coolies and other workers. STUDENT

## The Rufus Stone

**I**N the New Forest, England, there stands a venerable memorial of a great historic event that took place, or is alleged to have taken place, there. This is the Rufus Stone. But though undoubtedly there, it is now no longer visible. It was rendered invisible in the interests of its protection; for tourists of light-fingered proclivities were transferring it piecemeal to sundry spots which they considered more sacred—their pockets. Hence the visitor has to solace himself with a cast-iron pillar wherein the remains of the stone repose. E.

# The Trend of Twentieth Century Science

## Permanent Disease Bearers

A MEDICAL journal points out that recent researches show the permanent infectivity of certain typhoid patients. Their own attack may have occurred many years previously; they may have long ago regained what they regard as perfect health; but they carry the germs and are sources of permanent danger to their community. The same fact has been demonstrated for some other germ diseases. The patient's blood has risen to the occasion, accustomed itself to live with the enemy, can permanently hold its own. But it has not been able to go so far as to destroy it. In the case of typhoid, it is the intestine which has learned to be tolerant of the typhoid germ. The condition of these people is important to others rather than themselves, for the germ which cannot hurt them has lost none of its powers to thrive elsewhere.

We cannot isolate or persecute, or even usually discover these people. We can only go on doing the necessary work of preventing the epidemics which give rise to them — and teach those larger and more intimate measures which will render everyone immune against anything. Clean blood need have no fears. But that means a clean life, clean for twenty-four hours a day, clean in body and mind. When the city has provided sanitary dwellings, pure water, and unadulterated food, it remains for the individual to do the rest. And until he is taught how to do it, and then does it, there will always be diseases of some sort. The causation of disease goes up through all the planes of life, and most often does not even begin where we end our precautions. The most malignant germ is merely taking advantage, according to the laws of his nature, of the conditions which he already finds there.

STUDENT

## The Violinist's Tone

THE whole secret of the violinist's tone, though known practically to the great performer, is not yet known to him scientifically. *The Physical Review* prints a study of the matter by Mr. Harvey Davis, in which the author takes exception to one of the views of Helmholtz.

Two elements are concerned, speed and pressure of the bow. Loudness of tone, according to Helmholtz, depends almost wholly on the former, not the latter. This is the view to which exception is taken.

The new view is that for any given volume of tone, pure and with its proper quantum of harmonics, there must be a given speed and pressure. To increase or lessen this tone, both speed and pressure must be almost proportionally increased or lessened *together*, the ratio being preserved. To increase the pressure without increasing the speed, does not increase the tone, that is does not pull the string into ampler vibrations but superadds the small irregular ones which constitute scratching. Diminishing the pressure without diminishing the speed, does not proportionally diminish the amplitude of the string's swing in its whole

length, that is, does not diminish proportionally the volume of the fundamental tone, but for some reason prevents the appearance of the overtones. These are vibrations of the various fractions of the string independently of the swing of the whole length. The tone is therefore poor and thin.

The perfect violinist knows, of course, by experience, the exact amount of pressure which belongs to each degree of speed. If the above theory is true he must be effecting the *double* change, of speed and pressure, far oftener than his external consciousness knows. In attempting such changes, the cruder performer continually gets the ratio a little wrong and thus produces less perfect tones.

STUDENT

## The Roots of Disease

TO the man who catches sight of a truth there comes the immediate danger of supposing it to be all the truth there is. And nowhere is this more visible than in the matter of diet. Professor Carrington, of the American Institute for Scientific Research, has like a good many other people of less knowledge, arrived at the view that the one final method for the cure of all diseases is by fasting.

According to this theory there is but one disease, though it has a thousand facets; and it is not a disease at all, but a curative process. The *real* disease is the antecedent accumulation of effete material and the manifest symptoms are the attempt to expel these. This accumulation is, practically, the result of universal overeating. There being but one disease, there is but one remedy, if it can be called that. Put no more food into the stomach until all the accumulation is excreted; fast and drink water.

But suppose there is more than one disease — say six or seven, and you apply to one of the others the treatment that is prescribed for the one; how then? Grant the accumulation theory; grant the universal overeating; grant that say pneumonia, typhoid and a dozen or fifty others are really nature's efforts to clean up the refuse. Could you say the same of such a disease of the spinal cord as Locomotor Ataxia, whose essence consists in progressive hardening of the nerve paths so that they refuse to conduct? How can that be conceived as burning up or eliminating anything?

Do we sin against the laws of health in no other way than by taking in too much food? Are there no other functions than the digestive which are habitually overused or even utterly misused? And does it not seem likely that each class of misuse will result in its own peculiar train of disease? This may of course also help other trains, but in treatment, surely the *root* must be looked for. Suppose a man has brought upon himself a certain train of symptoms or disabilities resulting from immorality, or from repeated and unrestrained outbreaks of rage. It may well be that such a train would be overlaid and masked by another, that due to accumulation of effete products. For the organs of excretion would be

weakened by the primary cause, as also all other organs. If now, such a case is treated by the universal starvation method, it is possible that the secondary train might be relieved. But how about the primary and radical train? Furthermore, the primary malady might have so weakened the system that the pursuance of the starvation method, at any rate beyond an extreme minimum, might be utterly disastrous.

No; disease is not so simple a matter. There are as many underlying keynotes of disease as there are radical errors committed by man in his daily life. Some of the notes in the scales may possibly correspond though their keynotes differ, just as the note G belongs to several scales.

Until we have more knowledge, those who are wise will not risk the absolute starvation method. Under careful medical supervision, food may be reduced and reduced, until a minimum is reached. In that way the troubles connected with retention of effete matter may be eliminated, and something else, if there is something else, unmasked. But in the present state of medical science, it would be pretty sure to be unrecognized even with its mask off. For medicine, in rushing insanely along the paths of vivisection, serums, and animal extracts, is spending time that if otherwise used might yield real knowledge of the roots of disease.

## The Cycle of Coal

RECENT researches make it clear why coal keeps so much better under water than when exposed to the air. A great nature process is involved. It is now known that carbon, lamp-black, peat, coal and so on, all forms of carbon, when damp and exposed to the air, become the food of bacteria, gaseous carbonic oxide resulting. Heat is also produced — to be carried off, of course, if the surface is exposed. But in the case of a pile of coal through which air cannot penetrate easily, the temperature may rise so much that spontaneous combustion occurs. The bacteria are then consumed by the heat which their own activities have caused.

It is therefore obvious that given enough time nature would finally disintegrate and return to the air whole coal beds, liberating the carbon for the use of new generations of plant life. The time for such a cycle would be very vast, but then she has no need to hurry.

Probably there are also other bacteria, slower in work, who can consume carbon that is covered with water. This may occur to the coal-fields of a continent between the submergence and the next re-appearance.

One is inclined to wonder whether there may not be orders of bacteria of whose actual nature we can as yet form no conception, doing for the inorganic, the metallic, worlds what these known ones do for the organic. May not metallic disintegration — of which that of radium is a famous example — be really effected by lives of this kind? But how to look for them? — with what microscope? STUDENT

## Cockroaches in Amber

At a recent meeting of the Entomological Society in London, there was exhibited a fine collection of prehistoric cockroaches preserved in amber. The amber in which they were entombed is from Eastern Prussia and is of middle Tertiary age; it was originally the gum from a species of pine tree. Another species of cockroach occurs in the Purbeck beds, and a related genus (*Palaeoblattina*) as far back as the Silurian. A.

## "Sterilized Flowers"

TWO or three methods are suggested in *La Nature* for what is called the sterilization of flowers or plants—the preservation of them in unaltered shape. Various firms have various processes, which they keep secret. As the author says:

As far as it is possible to collect data, some makers appear to spray the flowers with a thin coating of rubber dissolved in benzine. Others dip them in a bath whose base is glycerine, but the exact composition of which is still unknown.

Both color and form may, it is said, be preserved by putting the flowers in a vase containing a layer of fine washed filtered sand, carefully pouring in more sand to cover them, and then keeping them for a good many hours at a temperature of 45° C. (113° F.). The warm sand quickly extracts all the moisture.

But the petals and leaves are now crisply and very breakably dry.

We would suggest that *this* would be the stage at which to impregnate them with a solution which would sufficiently restore their flexibility. A benzine solution of rubber or of paraffin wax (*used in the open air*, never in presence of a flame) might give the result; or a solution of wax in gasoline (also very inflammable); or water-glass containing a little glycerin; or a strong solution of gelatin in glycerin.

THE SUEZ CANAL AT PORT SAID

## Flowering Trees in London Streets

THE love of Nature by those shut out from it is manifested by the attempt to bring Nature to them, and there is a growing tendency to beautify large cities not merely by architectural embellishments but by touches of Nature. In London success has attended the planting of flowering trees; and, though these have so far been confined to a few favored localities, such as parks and public gardens, there seems no reason why they should not be introduced into the streets. They will stand the London atmosphere so long as their chief enemy, which is not smoke but dust, is kept at bay; and in well-watered thoroughfares this is done. Indeed, after what one reads about the devastation of country gardens by automobile dust, one might almost expect to find the plants coming to town for protection!

The trees used are hawthorn, white and pink, double and single; laburnum, almond, wild cherry and crabapple; but the most beautiful of all are the double flowered white and crimson varieties of cherry and the double crimson flowered peach. E.

## Scale Insect and Ladybird

REGARDING the method of fighting the scale insect by a species of ladybird, it is recalled that this insect came from Australia, where it was kept in check by the ladybird, *novius cardinalis*; so the ladybird was imported also and saved the tree. But a nurseryman in Florida, who in 1891 tried the same remedy for another kind of scale, was less fortunate. He imported along with the ladybirds some scale insects to feed them on. The ladybirds died, but the scale insects did not, and they established themselves in Florida, until brought under by fresh importations of their enemy, the ladybird. T.

### Psychism and the Half-Educated

A NEWSPAPER gives an account of the proceedings of a "Psychical Research" party which went out to discover ancient cities with the divining rod and claims to have located, beneath the campus of the University of California, the foundations of an ancient metropolis of the period of Atlantis.

The scientists and archaeologists, however, remained skeptical; so the party, under its leader, undertook another expedition to convince them. This leader is

a student of the esoteric and the marvelous, a pupil of the adepts of the Brotherhood of the ancient wisdom of India, discoverer of platinum and gold deposits by means of his magic powers.

He went out with about 150 followers, mostly women armed with divining twigs, but including men armed with luncheon baskets. After a long hot tramp they located the city at the outcropping of some stones. At one place these stones formed an evidently artificial right angle; but a mining prospector declared that it was because they had been used as fences by the miners. The lines and angles of the buried city were defined by divining rods, which, as it is claimed, in their efforts to point to their quarry, blistered the hands that held them; but no excavations have yet been made.

About the divining twigs, or "psychic compasses" as they are called, it is said that—

By means of a psychic compass in tune with one's aura, the professor said, it is possible to locate an affinity without difficulty. The compass will always point at the affinity just as surely as it will locate a buried city. Experiments conducted by him have proved this to his satisfaction. The women among the explorers showed interest at this.

The boon of political liberty which we enjoy in this country has doubtless strengthened the fiber of the people to some extent emancipating them from leading strings; but the process of endowing them with an adequate mastery over their own actions is still in its incipience. And so we have an irresponsible mob of the foolish and half-educated, ready to be led by *anyone whatever* who has enough brass to advertize himself by high-sounding titles and wild pretensions. Our liberty is as yet to a large extent merely nominal, because it is impossible to bestow liberty on people who refuse to accept it, or who, in other words, carry about with them in their characters the conditions of slavery. Such people love tyranny; and if they cannot find it in official guise, they will create it for themselves by tying themselves on to any leading strings they may chance to see dangling. Thus it is an age of demagogism and of cults led by self-appointed leaders. The people has yet to evolve from itself a power sufficient to control itself.

We are waking up to the danger of license in manipulating the resources of industry; and we are obliged to impose many restrictions

in the interests of public hygiene. But there is much still to be done in other ways. In the CENTURY PATH a good deal has been said about the necessity for guarding against that far worse danger of moral and mental infection, by which the diseases of the mind and soul are disseminated by unsterilized literature. It is clear that in many ways, the public is in possession of more facilities than it is able to use wisely, and that a point will soon be reached when it will be necessary to limit license in these respects. As long as the resulting vagaries are mere matter for ridicule, comparatively little harm may be done; but every day we get more evidence that people are running on to dangerous lines in connexion with this so-called "psychism."

It must be accepted that throughout the whole period of currently accepted history, there has always been an irresponsible mob of the ignorant and half-educated, call it by what name one will. This mob is not composed of any particular class, but of such people as, by their character, have enrolled themselves in it; and its folly exceeds the bounds of satire and is revealed in fresh depths by daily record of its achievements.

It is small wonder that Theosophists, having human welfare at heart, should protest against the indiscriminate diffusion of ideas about occultism among such a crowd, and should insist so strongly on the necessity of self-discipline as the primary and indispensable condition of all knowledge. The policy of Theosophy in insisting on this condition, and the folly of those who ignore it, is being more strongly emphasized every day by the facts which come to light. When the public wakes up sufficiently to demand a general campaign against all these deleterious forms of crankism, it will have the hearty support of all true Theosophists; for they are only too anxious to clear the reputation of Theosophy from all possibility of association with influences so diametrically opposed to the spirit and aims of Theosophy. STUDENT

### "Ye are Gods"

THAT expression, "Ye are Gods," which, to our biblical students, is a mere abstraction, has for the kabalists a vital significance. Each immortal spirit that sheds its radiance upon a human being is a god—the Microcosmos of the Macrocosmos, part and parcel of the Unknown God, the First Cause, of which it is a direct emanation. It is possessed of all the attributes of its parent source. Among these attributes are omniscience and omnipotence. Endowed with these, but yet unable to fully manifest them while in the body, during which time they are obscured, veiled, limited by the capabilities of physical nature, the thus divinely-inhabited man may tower far above his kind, evince a god-like wisdom, and display deific powers; for while the rest of mortals around him are but *overshadowed* by their divine SELF, with every chance given them to become immortal hereafter, but no other security than their personal efforts to win the kingdom of heaven, the so chosen man has already become an immortal while yet on earth. His prize is secured. Henceforth he will live forever in eternal life. Not only may he have "dominion" over all the works of creation by employing the "excellence" of the NAME (the

ineffable one) but be higher in this life, not, as Paul is made to say, "a little lower than the angels."

The ancients never entertained the sacrilegious thought that such perfected entities were incarnations of the One Supreme and for ever invisible God. No such profanation of the awful Majesty ever entered into their conceptions. Moses and his antitypes and types were to them but complete men, gods on earth, for their *gods* (divine spirits) had entered into their hallowed tabernacles, the purified physical bodies.

The disembodied spirits of the heroes and sages were termed gods by the ancients. Hence the accusation of polytheism and idolatry on the part of those who were the first to anthropomorphize the holiest and purest abstractions of their forefathers.—H. P. Blavatsky, in *Isis Unveiled*, vol ii. p. 153.

### FRIENDS IN COUNSEL

#### Brotherhood and Dispatch

"HE doubly gives who gives at once"—we owe the Romans much for this condensed and pithy statement of a law of human life. Who does not know the long-drawn misery of waiting the fulfilment of a promise made in a spasm of benevolence, but whose performance is delayed through laziness? For very shame we cannot press our friend to carry out his promise, so that the weeks drag on, our plans are thrown into confusion by the long delay, and when at last with an apology he keeps his word, the memory of hope deferred quenches the flame of gratitude which we express more from a sense of duty, than as the free outpouring of the heart.

How much we may contribute to the sweetening and the purifying of our social life by letting others feel that they may rely upon us to fulfil our promises with promptness and dispatch! Some people fancy that in promising a favor they are doing something so extremely meritorious that they may be permitted to indulge themselves in procrastination to the utmost limit. Yet surely kindly services are not as works of supererogation; but rather obligatory social duties, to be done with just as much alacrity and vim as duties owed to one's employer.

The minds of many persons are like rubbish piles of withered buds of kindly actions that have never flowered; of seeds of lofty purposes that never sprouted into life. Congested heaps of mental rubbish such as this, must interrupt the friendly intercourse of man with man and overcloud the neighborhood with murky fogs depressing to the heart-life of brother souls.

Many an ardent youth burrs to go somewhere at a distance and devote his life to such heroic service for the race that the wide world shall ring again with his renown. But what humanity requires the most is faithful, prompt discharge of duties lying to our hand; so that among our circle of acquaintance there may grow a feeling of reliance in our common human nature, and thus strengthen ties of brotherhood among our fellow men. The records of such things may never find a place in newspapers; but living thus, we shall sustain a tone, sweet, resonant and strong, to counteract the discord of humanity's unending cry, and give new courage and hope. STUDENT

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** What explanation does Theosophy offer of the decadence and disappearance of races?

**Answer** I. A race is the expression of a mood of the world-mind, and ought to persist as long as the world-mind can find any advantage in casting itself into that mood or groove of thought. It would seem as if each race had been evolved tentatively; Nature saying to herself that maybe something excellent should be perfected there, something true and enduring, to be a monument of all she has in her own heart and mind of that color or species. For a while she does all for them that she may; gives them land and sea; mountains if she desires to have them close to herself; good seaports if she has an eye to a commercial people, and so forth: or maybe she hems them around with powerful enemies, to develop their power of resistance; or sets oceans and deserts between them and their nearest neighbors, that she may have a workshop and perfect quiet for her own designs.

But they must grow out of childhood, and the old protection, the old urge that brought them out from their first simplicity, must be withdrawn; then if their old ideals have died out and no new ones are forthcoming—no new ones, that is, of the kind that ennoble—vice fastens its tentacles upon the people, and either in a long or short time their primal virility is sapped and there is nothing for it, it would seem, if no opportunities to turn are taken, but some drastic cure, or else an ending. It is negativity that is the first step in the decline of all races. It is non-resistance to the forces of evil. Everywhere we are able to see, if we look a little closely, the activity of agents of unpatriotism who eternally are seeking to worm their way into the heart of each nation. Do not imagine that man is only held back by his own incompetence to advance; only by original sin, or inherent imperfectibility, and so on. It is a hard enough task for him, heaven knows, to push his way for any distance upward; do but discourage him a little; hang a few lion-skins on the monsters in his way and keep them from incontinentally braying as he approaches, and too often you shall frighten him back to take refuge in the old dank and miserable haunts. But that the path of every nation should be haunted by those whose business it is to deck up asses for their terrorizing, so to play upon their fear, their greed, their latent animalism, so to hedge and coax them on to the hellward road! And yet have not such forces always stepped in when a nation was about to fall, was yet in the balance? Traitors, stirrers up of rebellion, introducers of vice or of some spiritual drug—that is, some false doctrine—that would sap the manhood from a hero? The banks of time are strewn with the wrecks of empires, and there were scuttlers for every wreck; and one motive and spirit, one feels, behind them all.

What a work the nations have, set right out before them! What a cry there is, round and over the world, for anyone with a real

patriot's heart within him; anyone that will stand for a nation, and stand and stand: never mind for which nation, so he will only stand, and realize what is expected of him. The Mighty Mother must laugh sometimes, in her silent places, among her mountains and seas, at the exaltation of one of her daughter races above the others—she who loves all so well; who brought all into being that they might speak her heart and mind out, publish abroad the secrets that continually oppress her; that they may be her poems, her pictures; her power, her compassion, her gaiety, her wizardry, her prowess; that each might be utterly herself, perfect and whole, luminous, a glory and a wonder, an unmarred conception worked out at last. And how she must turn from one failure to another with infinite patience and pain; seeing the men elected (by divine right of their own) to be the guardians of this race or that, turning to their own pleasures, not alert, lacking wisdom, concerned with some personal matter, perhaps brought down by an arrow from vice—while the forces that destroy are insinuating themselves here and there, obtaining a hold, gathering influence in this quarter and that, using the prevalent weakness, fanning the besetting laxity or greed for dollars to flame and fever, so that men shall be absorbed and unheeded of the deadly invasion in their midst, so that no protest shall be made, no strong stand taken; so that no effective cry shall be raised as more and more men and women steal across the line that divides wholesome humanity from corruption.

Nations seem to be like individuals, and for lack of a right bent given to them in their youth fail to come through the danger period of life unscathed, and always fall short of their divine possibilities. So old age and decadence come upon them, and the advancing egos that first incarnated in them must go elsewhere, for that line is worn out and no further valid experience can be gained there. Karma has its own means then of wiping away the useless physical remnant; perhaps the women will become barren; perhaps some new disease will come in with settlers from another land, and sweep away thousands of a people not immune to it, as measles, mumps and chickenpox have swept away whole communities of the Redskins; perhaps the scavengers of civilization will come in and kill and kill, as Pizarro and his gang did in Peru. The main point is that no race can be destroyed that has preserved a living spark of its native purity within its soul, or that has remembered anything of the message from the gods that it was first sent forth to give to the world. It may be conquered, driven forth, oppressed, exiled in the desert or among the mountains; but so long as some spiritual word remains with it, it has the assurance of future blossom and reinstatement. On the other hand, those who tolerate corruption and vice, are inviting for their nation the fate of the Redskins or the Hottentots—extinction.

K. M.

**Answer** II. The following article by William Q. Judge, the second Leader of the Theosophical Movement, published by him in *The Path*, vol. vi, p. 211, is most instructive. It is entitled "Why Races Die Out—A Theosophist's Reason For It."

In our times we have instances of the disappearance of races, and very often it is attributed to the influence of civilized vices. The Hottentots have entirely gone, and the decimation of the Hawaiian Islanders is about complete. Similarly the Red Indians of the continents of North and South America have been surely if slowly, passing away, so that now there is only a remnant of them left, and soon after the Spanish conquest the great masses of the aboriginal inhabitants had faded away.

The Hottentots had reached almost the acme of decline when we knew them, but the Aztecs, Toltecs, and other South Americans had not reached such a pitch when they encountered the Spanish. The Red Indians had gone down between the two, while the Hawaiians were still below the Indians. It has always seemed to me that the claim that these races were destroyed by taking up our vices is not well founded. It is pleasant, perhaps, to the pessimist who dislikes this civilization, but it will not agree with all the facts. The decrease of population in the Hawaiian Islands cannot be justly attributed to rum and social evils taken over from us, although a great deal of injury no doubt arose from those abuses. About the Hottentots we may feel pretty sure, because their degradation was almost complete when they were discovered, and the Mexicans and South American people had no time to adopt Spanish vices, nor did such exist in a degree to kill off the inhabitants.

The theory outlined by H. P. Blavatsky is that when the Egos inhabiting any race have reached the limit of experience possible in it, they begin to desert that race environment and seek another, which, in the sure processes of Nature's evolution, is certain to be in existence elsewhere on the globe. The Egos then having left the old families, the latter begin to die out through sterility attacking the females, so that fewer and fewer bodies are made for inhabitancy. This goes on from century to century *pari passu* with mental decay. And this mental deterioration arises from the fact that the small stock of what we might call the retarded Egos who come in during the process have not had the experience and training in that particular environment, which had been gone through by those who have deserted to another race, and hence—on the Theosophical theory that brain is not the producer of mind—the whole *personnel* of the old race rushes down in the scale, sooner or later presenting the sad spectacle of a dying race. Final extinction is the result when the process has gone far enough.

At the time when the first step toward old age and decrepitude are taken by such a race, the eternal cyclic laws that always bring about a universal correspondence between the affairs of man and the operations of cosmos cause cataclysms to happen, and even in the seeming height of a nation's power great numbers of bodies are destroyed. Some indications of this may be seen in our own day in the great destruction of human life that has begun to overtake the older portions of the Chinese nation. These are finger posts that declare the beginning of the exodus of the Egos who have had such a long experience in that race environment that they have begun to emigrate elsewhere because their experience has wrought in their character changes which unfit them for dealing with the old bodies, and those are left for the starting of other less progressed men. After the lapse of more years the natural cataclysms will increase in violence and extent, engulfing more and more millions of bodies and preparing for other cycles. . . . And under the suggestion made above, the Egos untried in that environment only occupied the racial body for the sake of the experience which might be gained during the time that is left. Now our civilization with weapons and other means is completing the work, as it on its part fulfils the law by creating on the old soil an entirely new race in which the experience gained by the mind in prior cycles of existence may show itself forth.—William Q. Judge

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

Central Office Point Loma California

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unites the philosophic Orient with the practical West.

## "The Mind is Like a Mirror" Star and Crescent Symbol

IN the CENTURY PATH, No. 31 of this volume, was noticed an article in the *Scientific American*, on the origin of the Star and Crescent Symbol, in which article the writer, after showing the antiquity and wide diffusion of this symbol, indulged in some reflections of his own regarding "ancient superstition." And in the CENTURY PATH criticism of the article it was pointed out that the Star and Crescent symbol is far more ancient and far more wide-spread still; and that in common with many other symbols, it forms part of an ancient mystery-language the existence of which is well known to scholars, some of whom have been able to interpret it to a certain extent. In a recent number of the *Scientific American*, another writer gives some further facts about this same symbol, its use in heraldry, and as an emblem in England, Ireland, Palestine, etc.

But the mere academic discussion of its diffusion is a question of little more than antiquarian interest. Let us inquire a little into the meaning of the sign. The crescent or moon represents the Lower Mind or "brain-mind" of man; the star (which really stands for the sun, and is, in many cases actually replaced by the symbol of the sun) represents the Higher Mind, that which illuminates the lower mind, that from which the latter derives its reflected light.

Here, without going any further, we have at once ample food for reflection. The symbol was intended to perpetuate throughout the dark ages in imperishable form a certain great truth. And it has so perpetuated it; for what is more undying than these same symbols, not only the Star and Crescent, but the Svastika, the interlaced triangles, the Serpent, the Harp, the Heart, and many more, stamped all over the face of the globe, in every country, among every people, even the most apparently "primitive"? That ancient mystery-language was a language indeed; and they who engraved its symbols on the mighty stones they erected well knew how to stamp them not merely on the stones but on the consciousness of mankind so that they should endure through the ages a perpetual witness to the truth during ages of nescience.

That truth was that there exists in man a higher faculty than the mind.—or, let us say,

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

than what is at present generally understood by the word "mind." It was not because all antiquity was so struck by the fact that the moon receives light from the sun, that they recorded this interesting astronomical fact so effusively. It was because they knew of the intimate connexion between the great outer universe or *macrocosm* and the little universe or *microcosm*—that is man. The knowledge of this analogy between the universe and man is the key that opens the door to ancient wisdom, as the loss of that key locks the same door to modern speculation. The ancients knew that *in man there is a sun and a moon*, and that the moon reflects but a pale and fluctuating light from the sun. This moon is the brain—even nowadays admitted to have a strange connexion with the lunar phases.

It requires little skill to trace the analogy between the moon and the brain-mind. If there is one thing that especially characterizes the brain-mind it is its fluctuation, change, variability, inconstancy. This is the salient characteristic of the moon as a luminary. The moonlight is associated with illusions and with false colors. Similarly the brain-mind shows us things in false lights. It is not a faculty for perceiving the truth; it is a theory-making faculty; and it shows us different theories at different times. Doubt, speculation, conjecture, fanaticisms, prejudices—these are the productions of the brain-mind. Very brainy people, often mis-called "philosophers," are notoriously unpractical. The world of "imagination" and intellectual ideas in which they live is a lunar world.

But the faculty of perceiving the truth is another function altogether; it comes from a higher source than the lunar mind. Its function is not reasoning and analysing, but direct perception; it is like seeing compared with groping. This faculty may be described by the word "Wisdom" or "Intuition." Theosophy asserts the existence in man of a *principle higher than the mind*, and that this

faculty can be developed. The practical rules of life instilled by Theosophy are a direct encouragement to the development of higher faculties. Theosophy proclaims the eternal teaching of the Christs and Sages, that *Wisdom comes by Right Living*, that Knowledge is to the pure in heart. It declares that the uncertainty and confusion existing

in the intellectual world today, resulting in such an inability to deal with the serious problems of life, is due to the stunting of man's higher mental and spiritual development by his wrong methods of living. People pursue science with no regard to the fact that *self-preparation is a necessary preliminary*; and they are precisely in the same position as a biologist with a dirty microscope.

The worship of brain-mind intellectualism is a worship of the lunar crescent; and we need to be reminded of the star within that crescent.

Besides reflecting light from the sun to the earth, the moon also absorbs emanations from the earth and throws them back upon it. This pertains rather to forces with which science is as yet but little acquainted, and it accounts for the well-known baleful influence ascribed to the moon's beams. In the same way the imagination of man stores up images derived from passion, and is replete with delusions. In alchemical treatises, which were more often than not symbolical of the alchemy of the Soul rather than that of the crucible, we find a good deal about *cleansing the moon in a bath*, and so forth. This was not mere balderdash, as some wiseacres seem to think. It meant to show how we should cleanse the mirror of our mind that it may reflect wisdom from the sun of light.

The mind is like a mirror. It gathers dust while it reflects. It needs the gentle breezes of Soul-Wisdom to brush away the dust of our illusions. (Precept of a trans-Himalayan School translated by H. P. Blavatsky in *The Voice of the Silence*)

To purify the mind that it may perform its true function and reflect wisdom, transforming that which transcends thought into Thought—that is the alchemical process referred to. The Star and the Crescent is simply a page from the Book of Symbols preserving in the memory of mankind this most important step in the solving of the Mystery of the Sphinx. STUDENT.

## Electro-Atomic Physics

IN a lecture on "Modern Physics," delivered at Columbia University by Professor Ernest Fox Nichols, and abstracted in the *Popular Science Monthly*, we find some interesting particulars about the new discoveries in electro-atomic physics and the ideas to which they have given rise. As far as observation is concerned, great strides have been made; and great strides have been made in provisional theories to explain the phenomena observed and to be used as a basis of reasoning. But, of course, as to the question of ultimates, which the lecturer also discusses, there is the usual obfuscation due to the attempt to find causes in the world of effects and to define the rudiments of matter in terms of physical effectual matter.

### Space, Mass, Energy

The ideas which underlie all our thinking are space, time, and inertia or mass. With space and time as a background, the physicist must pursue inertia, and everything related to it, along every conceivable path. In this pursuit he comes upon four ultimate though related conceptions: matter, ether, electricity, and energy.

But it has often been shown that these so-called rudiments are not distinct from each other, but overlap. They have attributes in common, and the attributes of one are not properly eliminated from the others. For instance, "space" is usually imagined as a very large room, the walls perhaps at an invisible distance, but having the usual six directions. Thus this "space" is extended and dimensional, like matter, and is in fact a kind of thin gas.

Again, we cannot separate mass from energy. Energy cannot be conceived apart from mass. Nor can it be expressed mathematically apart from force. The formula is  $W = \frac{1}{2}mv^2$ , and that relating to force is  $F = ma$ . If  $m$  be regarded as infinitely small, then  $v$  or  $a$  must become infinitely great, and our force becomes reduced to an infinitely great acceleration in an infinitely small mass—that is, becomes reduced *ad absurdum*. Energy and force are compounded of mass and motion, and the ordinary intellectual faculties used in scientific and mathematical reflection cannot resolve the idea into more elementary forms. Neither mass nor motion can be conceived as existing alone. On the one hand it is impossible to imagine a body without mass having any energy, no matter how fast it may move; on the other, the only idea of mass which (reasoning along scientific lines) we can formulate, is that of a *resistance* due to an opposing *force* or *energy*. Therefore one must affirm that mass and energy (or force), in the scientific sense, are not realities but abstractions—that is, mental groupings of certain attributes which can not exist alone. Nevertheless these same words, "space," "force," and so on, may have a meaning as used by thinkers along other lines; as, for instance, they have when used by

H. P. Blavatsky in *The Secret Doctrine* and by certain ancient philosophers from whom she quotes.

To illustrate. Consider a picture. Let us separate it into two things: the pigments and the design. The pigments can exist separately; but the design can not, in the scientific sense, exist separately. Nevertheless, from the metaphysician's point of view, the design *does* exist separately—but in the mind of the artist. Suppose science were to say that the picture was the result of a certain force called "Design" acting on a certain inert thing called "Paint." We should be justified in saying that this force called "Design" had no real existence in the scientific sense, but was an abstraction; yet, in another sense, and admitting the existence of a higher place of existence, Design *does* exist in the mental world.

Thus force, divorced from mass, quits the physical plane altogether, and we must seek it on a higher plane; for physically it can only exist as a quality of something else. In like manner, we cannot reduce mass to a fundamental conception without passing on to a higher plane. It becomes mere resistance, which is either an abstraction or an attribute of mind, according as we argue physically or metaphysically. So the physicists have the choice of either seeking their elements on a plane outside that of physical matter and physical space, or else of being content with mere fallacious representatives of those elements. When one reads that—

A small school of physicists . . . have frankly set energy before inertia, and have endeavored to deduce matter and all else from it—

one feels inclined to ask them for a definition of energy, a definition which of course must not include or involve a single one of the attributes to be explained by it. We defy them to give any definition other than a metaphysical one. In what can this energy inhere? There is no matter for it to inhere in, for matter is, by the proposition, a consequence of the energy. Fancy a particle of energy, a grain of energy, a center of energy—what you will—floating about in space all unhitched! Having no mass to check it, will it not run wild? Having no mass to back it up, can it accomplish anything? Is it even conceivable?

In the researches about electrons, described below, we see that, even in the electron, which is regarded as the atom of the atom, the ideas of mass and motion are still indissolubly blended in the irresolvable notion of force or energy. There is the attempt to define the mass of the electrons as such and such, and their velocity as so and so. The mass is made very small and the velocity very great. But we still have no conception of the one apart from the other, nor can we have so long as we try to give that conception objectivity in the physical sense.

## Ether

The ether which surrounds and incloses all our universe we came first to know as the bearer of waves of light and heat. Ever since that time we have known it to possess inertia; for no medium devoid of inertia can carry forward a wave motion.

When, one is tempted to ask, did we come to know of the ether? The general impression is that we *invented* it. The idea which the above words seem to convey is that we *discovered* an ether and observed waves in it. The fact is that we observed something resembling waves in light and then invented the ether, because we needed something for the waves to be in. And so of the inertia; we had to suppose that the ether must have inertia because, as said, otherwise it could not carry forward wave motion. (An admission, by the way, that force can not be thought of apart from mass.)

## Gravitation

Of gravitation we read that we have gotten no farther than where Newton left it. We have not the slightest valid conception of how the pull of one mass upon another is conducted across the intervening space. We have been unable to detect any quantity representing a speed of propagation of gravity. In this respect it differs from electricity, as it also does in the fact that no intervening screen makes any difference to it. Consequently we have not been able to refer gravitational force to the ether.

Gravitation is still unconnected, unattached to anything else in nature. . . . It is still the stumbling-block to the physicist. . . . How can he explain a universe when he is unable to give a reasonable account of the cement which holds it together?

## Electrons and Atoms

In electrolysis the products of the decomposition appear in definite proportions at the points where the current enters and leaves the liquid. The current in the liquid consists of two oppositely moving processions of single charged atoms. These charged atoms are called *ions*. No smaller charge than that carried by an atom of the hydrogen valence has yet been found, and all other small charges are exact multiples of this value.

Thus we have found something very like an atom of electricity; and, while we know of eighty different kinds of material atoms, we know only two of electricity—positive and negative. Thus these electric atoms have the claim to greater simplicity; we call them *electrons*. When a molecule is broken in two, the parts are always found equally and oppositely charged; and it is inferred that though they held these charges while in combination, the forces then neutralized each other and no force strayed beyond the molecule. It seems probable that the electric force between the atoms is the cement of affinity which binds them into molecules.

In studying the conduction of electricity through gases, we find that gases are bad conductors, the reason given being that they con-

tain so few broken molecules in proportion to the number of unbroken neutral molecules. But gases may be made conducting by acting on them in such a way as to produce ions, *e g.*, by x-rays, radium rays, etc. Another way of making gases conducting is to exhaust them, thus reducing the number of obstructive neutral molecules and leaving the ions a free path. This can be done in a glass tube having sealed into each end a metal conducting rod ending in a small metal disk. When the air is rarefied the current will pass. If, however, the exhaustion be carried beyond a certain point, the gas becomes a bad conductor again, there not being now enough ions to carry the current. At this point the *cathode rays* appear. These rays depart from the negative end of the tube. They are invisible, but their presence can be detected and their behavior studied by the fact that many substances, including glass, when placed in their path, shine with a brilliant phosphorescence.

By this means it was discovered that they travel in straight lines. If focussed upon a delicate paddle wheel, they make it rotate, as if struck by a stream of moving matter. They can penetrate opaque substances. There is a field of magnetic force about them; a magnet deflects them. Hence they are not like light-rays and they have inertia; and the action of the magnet on them proves them to be *a stream of negative electricity*. Speeds as high as one-tenth the velocity of light have been calculated for them, and the ratio of electric charge to mass comes out at one thousand times that found in the hydrogen atom in electrolysis.

Ingenious experiments have been made to estimate the size of these electric atoms. The bodies flying in the cathode stream appear to be masses no greater than the one-thousandth part of the hydrogen atom, and to be *minute portions of pure negative electricity wholly free from (so-called) matter*. All attempts to get an atom of positive electricity have so far failed.

The extreme complexity of the material atom is shown by spectroscopic examination. Iron gives hundreds of definitely placed bright lines, indicating that number of distinct modes or rates of vibration.

Before the evidence of the spectroscope the older idea of the atom as a simple structureless body falls to the ground. The complexity of a grand piano seems simple in comparison with the iron atom.

Atoms are now regarded as systems of electrons that revolve around their center like planets around a sun; and the difference between the atoms of different elements may be merely a difference of number and configuration in the electrons of the system. The experiments in radio-activity seem to indicate that these planetary systems may lose energy and become unstable, and that then a readjustment takes place, electrons are hurled out, and the system settles down into a new arrangement. This is the explanation given for the transmutations of one radio-active substance into another and of the large amount of energy liberated by the change.

One remark made is that the electron, when revolving briskly enough in an orbit within the atom, gives us colored light of highest purity; and that when violently and irregularly agitated, it gives white light. "Without it, all light would be impossible."

Another remark is that the idea is gaining ground that *matter is undergoing a slow evolution*.

Clearly nothing is fixed. The atoms are stable, relatively but not absolutely; their atomic weights are more like general averages than fixed quantities. Underlying all physical manifestation are the two elements or rudiments answering to inertia and force, positive and negative, matter and motion, or however one may denominate this necessary duality. So far as our perceptions are able to penetrate we always find these in combination. The ordinary mind is incapable of forming a conception of what those elements are which constitute the first beginnings of manifestation on the physical plane. What is the primal undifferentiated physical matter? What is the most elementary manifestation of energy in this matter? These questions carry us beyond the bounds of physics.

Occultism, however, not limited to the means of information afforded by the physical senses, nor by the mental forms derived therefrom, avails itself of subtler means of investigation. Making first a study of human faculty itself, it busies itself, as all good scientists should, in perfecting its instruments. Thus Occultism studies Nature through Man, and the external through the internal. May it not be possible for the purified mind of the Occultist to transcend the barriers of ordinary space and time (which are limitations of our senses and conceptions), and thus to grasp things inconceivable to the ordinary mind? We know that there are limitations to the faculties which we ordinarily use; but we know these limitations do not mark the limits of Nature. Surely there are faculties of perception corresponding to the further regions of the objective world; as we have *physical* senses for *physical* observation, so we have *higher* (not physical) senses for *higher* observation.

STUDENT

#### Pinchbeck Vedântism

AFTER an all too brief sojourn, the "Tiger Mahatma" (!) departed, lamented on all hands. As a fine comedian the public liked to feel that he was in their midst. His disciples lament him because the spiritual feast of wisdom to which he invited them has left them as hungry as when they came. Worse still, an impending lawsuit seems likely to raise the curtain upon the feast and make it one of the scenes of the comedy.

A number of impressive names are on the list of disciples, one that of an ex-secretary of the navy, now president of an insurance society; a large railroad director, a noted actress, and many lesser people.

The "Mahatma" was omniscient: he admitted that himself. So it was natural that he should give to his band of financing (and largely financier) disciples the impressive name of "Parliament of Infinite Wisdom." But the ex-secretary, either because his own sense of humor was not quite dead, or because he feared that that of the public was not, stipulated in becoming president that this great name should read "Association for the Study of Ancient Wisdom." Their guarantee that the "Mahatma" could impart this wisdom consisted in his own frank admission that he could. But they would naturally see

the necessity of supporting him during the impartation and so they housed him at a rental of \$138 a month. He appears to have remained in the house about three months, then for good reasons of his own, winging his way to India. But the feast had only got as far as the mere preliminaries; the Infinite Wisdom course, the roast, as it were, was yet to appear.

The Society nevertheless survived in its expectation. But it dwindled; the president resigned; the house became a mere floor—we do not like to use the word flat because of other meanings. And now the treasurer brings action against it for the miserable sum of \$658, which, he says, he disbursed from his own pocket. Service was sought on the two chief financiers, but, say the process servers, these gentlemen cannot be found. They did, it seems, imbibe a *little* Infinite Wisdom.

We have it on authority no less than the "Mahatma's" own, that he was omniscient: "I am a god; I know everything." By way of specifying for our poor intelligence, he told a Mr. Creelman that he could see all America without going outside his own room. But there seem to have been times when the omniscience took a rest, for he subscribed to a press-cutting agency, took in a number of journals, and at any rate once went on an auto ride. All these items figure in the bill of expenditures, along with others; for example a \$6 snuff-box, a \$7.75 ladies' bag, and a \$4 fountain pen.

The public, as we have said, will regard the whole business as a comedy. It is, in a way; but it is much more.

This man was only one of many, all of whom know well to what market to bring their wares, where, thicker than anywhere else on earth, the eager gullible do crowd.

From time to time a true intuition makes itself felt in human consciousness that life has in it more than has ever yet been sounded, that man can know more and be and do more than ever yet he has figured.

But the *consciousness* into which this intuition comes is almost wholly selfish. It stirs to the message, but its instant question is, How can such knowledge and such new powers serve *my interests*? Is there money in them? Will the "*powers*" give me *power*?

Again, there is a class of men asking these questions who cannot be satisfied with the facile emptiness of the "New Thought" philosophy, who are not primarily anxious to cure their diseases, who know the chatter about the "All-embracing Good" for the nonsense it is, whose live and cultured intellects cannot be stayed on the formula that "God is All" even when demonstrated by backward reading of it.

But the test is simple enough. *The* thread, the only one that leads straight on to light and wisdom and the "*powers*"—is altruism, compassion. The moment that thread is let drop, the true path is departed from and another entered. *With* that thread, errors can be redeemed, stumbles recovered from; without it the final wreck of mind and body, if the course is pursued, is certain.

Fortunately, as in this case, few persist. The kindly divine Law steps in to save, not seldom steps into the human law-courts, lets in the light of human ridicule—and the danger is over.

## Art Music Literature and the Drama

ISLAND AND HARBOR OF CORFU

### Corfu, the Beautiful—Immortalized by Homer

THE island of Corfu, so full of historic and legendary interest, is the first of the Grecian isles to burst on the view and enchant the heart of the traveler who has taken ship at Brindisi in Italy to visit the shores of Greece.

Corfu, the largest and most northerly of the Ionian Islands, lies just off the coast of ancient Epirus, now the Albanian coast of Turkey. The name "Corfu" has only belonged to the island since the Middle Ages. To students of ancient history it is still known as Corcyra, that colony planted by Corinth in the eighth century B. C., which in less than a century had opposed and defeated its mother city in a great naval battle, this being the immediate cause of the Peloponnesian War. It was from the old and now abandoned harbor of Corfu that the fleets of Alcibiades and Nicias set sail on their ill-fated mission to Syracuse.

Since the fall of Greece, Corfu has been ruled by Rome, Byzantium, Naples, Venice, and England, and is now part of the modern kingdom of Greece. However, it is not as Corfu of medieval times nor as Corcyra of ancient Hellas but as Phaeacia of legendary days that this gem of European islands stirs the heart and stimulates the imagination.

From the ship's deck at dawn we watch the approach to the island, the pearly tints of

earth, sky, and water soon deepening into the glory of an autumn morning. What scenes of the hero-days of Greece come thronging into the mind as we draw nearer the old island home of the Phaeacians, immortalized in the *Odyssey*. One thinks of Odysseus, his raft gone, battling with the waves in his long and desperate struggle to reach the island, and having gained it, sinking into the deep sleep of exhaustion to be awakened by the happy laughter of Nausicaä and her maidens playing at ball on the yellow sands of the beach. Nausicaä! perhaps the most admired character in all literature—so simple and direct, so fresh and lovable, yet with all the dignity and bearing of a king's daughter. In fancy we see their meeting and follow them from the beach, up through the town where Odysseus meets the goddess Athena in the guise of a young girl carrying a pitcher; then on to the gardens and palace of the wise and good king Alcinöus. After partaking of the hospitality of the king's house, sitting in the great hall listening to Odysseus recounting the wonderful adventures of his wanderings and the perils that have beset his way, we watch his departure for Ithaca in a ship furnished by his host and manned by Phaeacian sailors. The "Ship of Ulysses" turned to stone is still seen in the harbor of Corfu in the shape of a tiny island which is now occupied by a monastery.

Corfu is covered with vineyards, forests of

cactus, dark cypresses and groves of olives. We see millions of olive trees so gnarled and twisted and ancient that they seem to have come down with the legends of Homeric days. In the streets of the town many nationalities and a variety of costume are to be seen; conspicuous among the crowd always are the men of Albania with their absurdly short accordion-pleated white skirts worn over long white woolen tights, and the Greek priests in black gowns and brimless stovepipe hats, their long hair coiled like a woman's low on the back of the head. The professional beggar manages to exist, that is, to ward off actual want, but among the better classes there is often real poverty. Some of these work at pillow lace-making but most are owners of orange or olive groves although through poverty or lack of industry they neglect their estates and have poor crops. A few own small yachts or miniature house-boats which winter visitors hire for their shooting expeditions to the Albanian hills. The most picturesque worker is the sponge-fisher in his little sailing skiff.

There are two royal villas on the island; one, *Mon Repos*, the summer residence of King George of Greece, is situated on the supposed site of the palace and gardens of Alcinöus; the other, *Achilleion*, was the home of the unhappy Elisabeth of Austria. This forsaken palace had a strangely quiet, restful lifelessness about it. STUDENT TRAVELER

All the interpretations that we give must be to a degree imperfect, for the reason that language always fails in its effort to translate the real utterances of the Law.—Katherine Tingley

OUR knowledge of modern times came from the ancients; so practically "there is nothing new under the sun," as one wise Teacher said. All is really from the past. The elements of geometry we have from Euclid. Why did not Tom Jones, an Englishman, compile them? Euclid received his knowledge from others still more ancient. To prove this, the remains, recently discovered, of some of the greatest of the Egyptian Kings and Queens, still surrounded by objects of art which had fortunately not been disturbed, show, in these remote times, that the farther back we go the more perfect the work is because in the most ancient times man had perfect Teachers.

In proof of this examine the great pyramid of Egypt. It exhibits in its construction wonderful accuracy of knowledge in mathematics and mechanics, and Theosophy says in true spiritual knowledge. Its method of construction and accuracy is so marvelous that in spite of all our cleverness in modern times, and we have very clever scientific men, we can grasp but a very little of what is contained in that pyramid. Professor Flinders Petrie, who is an expert among experts in Egyptian archaeology, says that in the base upon which the great pyramid is built there are very large stones which are so closely fitted together that they are only from one fiftieth to one two-hundredth of an inch apart. In spite of all our skilled science it probably would be impossible to find any workmen on the face of the earth who could do this feat.

Yet Dr. Flinders Petrie found even more marvelous things. We pride ourselves on our mechanics and in modern times we certainly have done some very wonderful things and built some astonishing buildings. In drilling rocks we use a drill and sledge hammer, but the Egyptians used a circular saw, and every turn the saw made in the stone is so deep, that Dr. Petrie estimates that if diamonds were set in the hardest steel, at the

## The Pyramid Builders

first turn of that saw the diamonds would be torn from their sockets. What did they make that machine out of?

Here is another most marvelous thing: the great stones forming the base of the pyramid are not laid in a straight line but form a curve, and when the center of this curve was calculated, it was found to be the same as the center of the earth, showing that the diameter of the earth was known exactly. In the interior of the pyramid is a certain long passage which at the time it was constructed faced the

**T**HE office of Teacher was always considered as a very solemn and responsible one among our Asiatic ancestors, and the pupil was always enjoined to obedience and loyalty. This is what you have to tell them, advising them to study Manu.—From a letter to H. P. B. written by her Teacher

then Pole Star. The pyramid is set North, South, East and West, which is called its orientation, and this is done with such marvelous accuracy that Dr. Petrie, though he had the most delicate instruments it was possible to obtain, could not tell whether this work was absolutely perfect or not; because if there were any difference it was within the limit of his personal error. That is to say, each observer when making these very delicate mathematical observations looks a little differently. It may be very little, but there is always a slight personal difference even with the best observers. We have no people on the face of the earth that could put up such a building now. No ordinary man could do it. The leveling of this building is also more perfect than that of any modern construction. There are many wonderful things in regard to astronomy contained in this pyramid, showing that those who built it had marvelous knowledge.

Some thought from what they could make out of ancient references to the building of these pyramids, that slaves built them; but as one of the Students at Point Loma very truly says: no slaves could do such perfect work, only the freest of free men could do it, men who put their whole heart, mind and soul in their work; for it is only then that such accuracy is possible.

These Pyramid Builders were divine workers, and the Great Teachers we call Saviors were of the same great Brotherhood. We are accustomed to hear of only one Savior, but from these quotations you will find that many taught the same truths. Now we know that in the "Sermon on the Mount" the whole teaching breathes of brotherhood, and Jesus pointed out that like unto the greatest commandment of all was the one of brotherhood, to love your neighbor as yourself, and to do unto others as you would they should do unto you. 500 years before Jesus Confucius lived in China, and he said: "Do unto another what you would have him do unto you. Thou needest this law alone; it is the foundation of all the rest."

In Greece Aristotle, who lived 385 years B. C., said: "We should conduct ourselves towards others as we would have them act towards us."

Thales, who lived 464 years B. C., said: "Avoid doing what you would blame others for doing."

Sextus, a Roman who lived 406 B. C., said: "What you wish your neighbors to be to you, such be to them."

And the great Gautama Buddha gave out these divinely compassionate words: "A man who foolishly does me wrong, I will return to him the protection of my ungrudging love: the more evil comes from him, the more good shall go from me. Hatred does not cease by hatred at any time: hatred ceases by love: this is an old rule." For this rule was old in his time, which was about 600 years B. C.

Lao-Tse, an ancient Chinese sage, said: "The good I would meet with goodness. The not good I would meet with goodness also. The faithful I would meet with faith. The not faithful I would meet with faith also. Virtue is faithful. Recompense injury with kindness."

Manu, the great Hindû lawgiver, who lived thousands of years B. C., said: "By forgiveness of injuries the learned are purified."

Kwan-Yin, the great "Mother-Savior" of China, (and this is the place we send missionaries to!) said: "Never will I seek or receive private, individual salvation; never enter into final peace alone; but forever and everywhere will I live and strive for the universal redemption of every creature throughout the world."

And Socrates, the well-known old Greek philosopher, said: "It is not permitted to return evil for evil."

Does not this show that these teachings had a common source? This common source was the most ancient of ancient knowledge, the Wisdom-Religion taught in all the great schools of the past. The great Pyramid was one of the buildings of the Initiates in the wisdom of those schools, as our great Teacher, H. P. Blavatsky, has said. Their disciples were initiated into the Mysteries, or what is not commonly known of the wisdom of life, and then came before the world as Teachers. These Pyramid Builders were among the great Divine Instructors of the very early days. STUDENT

### The Viking Skald

GUTHRUD, the Viking-Skald of the deep gentle eyes, the long white beard and the robust champion-stature, sat resting on a stone below the roaring waterfall and played, lost in reverie, on his harp. For a time he had retired from the halls of the kings, had wandered apart from the games of the champions and the banquet, to seek the wisdom and power of his soul out in the heart of nature. In seclusion he hoped to gather inspiration for more sublime songs, in order to fire the heart to heroic achievements and noble exploits. For in the prevailing peace the kings had dozed off into a deadening quiet, forgetting that power so quickly kindled in the tumult of war can and should be kindled in the deepest peace and be used to further the public weal.

The look, when Guthrud at last lifted his eyes, was full of sadness, but it changed at once and became strong and beaming in passing over the wild bold play of the water. The Viking rose, turned toward the sun, and, seeming to behold something far, far distant, began once more to play on his harp and soon even to sing with his warm expressive voice, which always went straight to the heart:

Long I wandered, longer still I have to wander,  
Deep in the nightfall and dusky night.  
Glorious it was in the days of old  
To stand by Oden, the mighty God,  
The earth freely giving its deepest secrets.  
Glorious it was, encircled by light,  
Deep into All-Father's world to look.  
Glorious it was, when the Song of Life  
Welled forth in mighty harmonies.  
But the oath took Oden: Never to rest  
In constant wandering among the races of earth;  
Never to tire in expounding the wisdom  
In words and tones and warming song;  
Always to help a suffering brother,  
Always to guard the truth, liberty and right;  
Until the Sun once more should enwrap the earth  
And the people of earth in welcome should lift  
To the regions of Oden the sacred song,  
Calling the mighty God again to their midst.

Long I wandered; longer still I have to wander,  
Deep in the nightfall and dusky night.

Deep in the nightfall and dusky night.  
Yet can I sing of olden memories,  
Sing of the coming happier days,  
Waking gentleness in too fierce champions,  
Strength and activity among the weaklings.

Then the people, the glorious, fair, and strong,  
Ever shall remember the light of the Sun,  
So shall it follow, when the purple skies  
Usher the day of the coming Master.

The noble old champion stood tall in the mystical light of the setting sun. The chords of the harp became more and more dreamy; the eye seemed to pierce the distant future.

At once he was silent, listened yet for a while to the roaring water—then once more he was Guthrud the Viking-Skald, and once more he turned his steps to the halls of the kings.

A SWEDISH STUDENT

SUMMER PALACE OF KING OF GREECE: CORFU

Seldom the voice of the mighty God  
Reaches the heart of his listening champion;  
Seldom the light from All-Father's throne  
Sends a ray through the misty clouds,  
Waking memories, glorious, beauteous,  
Leaping like fire from the strings of my harp  
To listening crowds of the Northland people.

The night is here, and the golden Light  
Yields to shadows from Southern lands.  
Hard is to breathe for the champion of light,  
Hard the sacred fire to guard.  
Force and wrong-doing, strife and discord  
Shall ravage the races of men.  
The night is here, the Northern Light  
Yields to shadows from Southern lands.

Yet, Oden, I see it, the night shall pass,  
The dawn shall come of a greater day.  
A mighty champion with power from on high  
Once more shall reveal the radiant Sun.  
The Light shall prevail and the champions awake  
To new achievements and noble games.  
The song shall sound in thousand tones,  
The skalds shall picture the worlds of the gods.  
In purple shimmer thus rises the hymn,  
Calling Thee, Thou mighty Oden,  
Down amidst worthy descendants.

Long I wandered; longer still I have to wander,

the sake of one's country! It is a true note of higher patriotism, such as one does hear now and then ringing out clear and strong above the din and jangle of the bedlam of unbrotherliness through which humanity is passing. It is events like this that make one know that the bitterness, turmoil, wearying wrong and pain now hanging like a cloud over Russia shall yet be dispelled, and that the sun of brotherliness shall one day shine forth.

IN far away New Jersey there are now signs of an approaching storm. The pastor of the Philip Neri church, (Romanist), Newark, N. J., has issued an edict against the wearing of the now fashionable hat by the members of his flock, and from his own words (recently quoted in several papers) one can see that the very foundations of his religious body may be threatened if something is not done. He says:

The hats are so large, that in some cases the persons wearing them have to stand outside the confessional. In others the brims necessitate the penitent kneeling so far from the confessional that the secrecy of the confessional is partly destroyed because the priest and penitent have to speak so loud that those outside the confessional can hear them.

### Jottings and Doings

(From a Student's Note Book)

A DESPATCH from St. Petersburg says that the women students of the Young Ladies' College in Perm have made a definite moral appeal to the members of the Boys' College in the same town, begging the latter, for the sake of their own souls and for the future, to do their part "to help maintain the high moral standard we, the young women students, have set ourselves." Their letter of appeal ends with the following significant sentence, "We can not do Russia a greater service."

Something is surely working in Russia, something far removed from the bacteria of nihilism. To live a pure life—for

# OUR YOUNG FOLK

## A Trip On the Bay

Excursion of the San Diego Râja Yoga Day School on June 26

A PERFECT morning with just enough breeze to make the blue waters of lovely San Diego harbor sparkle in the sunlight, but not enough to cause any anxiety or inconvenience. A large and merry party of the pupils of the San Diego Râja Yoga Day School is waiting at the School, bright and early, to set out for the much-desired excursion on the water, and soon teachers and children are comfortably seated on the big gasoline launch *Fortuna*. Now we are off with great shouting and waving of handkerchiefs, and soon the city and the great wharves where the ocean steamers are lying are left behind us and we are heading straight for Point Loma.

Now is the time to keep a bright look-out for any strange monsters of the deep that may venture into the harbor. Perhaps we may see a mermaid or the great sea-serpent! But if nothing else appears we shall be quite content with the amusing antics of the big pelicans who live on North Coronado Island which forms one side of the harbor, and whose fishing-ground is about here. Look, how they dive! rising high into the air, and then down, down, like a flash of lightning, cleaving the water with their huge beaks, nearly as large as themselves! See, that one has brought up a big fish!

But now we are at Roseville wharf, which is the landing-place for Point Loma Homestead. We touch for a moment at the wharf and then are off again towards the wide ocean, of which we can just get a glimpse in the far distance. By this time every one has developed a tremendous appetite, no doubt from the sea air, and lunches appear on deck only to disappear in double quick time.

The next feature of interest is the Government Naval Coaling Station, now being built near the end of Point Loma, which is going to help the prosperity of our city greatly. The huge caissons and the different works and machines are very attractive to the children, but look, look, what is that? Yes, it is a seal. How its black coat shines in the sunshine as the wavelets dash over it! It does not seem a bit afraid but sits and watches our boat go by. The captain tells us it came to see what was going on soon after the works were begun, and finding all friendly it decided to stay. It is a pretty creature with soft, doglike eyes.

Now we are passing the barracks and Fort Rosecrans, where the soldiers heartily return our shouts of greeting by waving their handkerchiefs, and now comes Ballast Point and the narrow but deep opening of the harbor, which is protected by the great cannons at the fort. We cannot see the guns because they are always hidden except just when they are

## SONNET TO INDUSTRY

**T**HROUGH work we learn. It helps us to unfold skill, and reveals hidden ability. We love it in all forms.

Work is good for everybody. It teaches us life's lessons. It awakens conscience and compassion, a love of greatness and deepest peace.

When anyone finds himself moving away from his happiness, then quickly—to work! With hand and mind let us work, not losing any time, but using it well, thus gaining light to see more clearly.

going to fire. At last we are out on the broad Pacific and feel the increasing breeze and see the white surf rolling against the precipitous cliffs at the extremity of Point Loma. What a beautiful scene! Someone says it is just like the Rock of Gibraltar; but it is not so high and is very much longer. We can see the old lighthouse high up on the summit, five

hundred feet above the ocean. It is not used now, for its place is taken by the new one at the base of the cliff, where there is less mist.

All things must come to an end and it is now time for us to turn around and make for the city, where we arrive in great spirits and full of delight in the interesting things we have seen and wishing the voyage twice as long. Then with a hearty cheer for Captain Hall, who has taken such good care of us, we set off for our homes feeling that the summer vacation has really begun. Hurrah for Râja Yoga! ONE OF THE PARTY

## The Value of Camping Out

**O**NE of the best known American nature-lovers, John Muir, calls attention to the absolute need for everyone to return, at least occasionally, to the fields and forests for a plunge into primitive, natural wildness. This is the great joy and benefit of "going camping"—to return as nearly as possible to free savagery in all material things, and then deliberately, thoughtfully, by the resources of our own wits, construct our own

civilization from whatever may be available. It is scarcely possible to imagine a better course of study in social economy, and personal economy also, than to go empty-handed into some reasonably friendly forest and secure one's own necessities, create one's own comforts and enjoy the forest luxuries. So many things change their perspective when seen from such a retreat; so many "necessities" are found to be at the utmost merely luxuries; and the real needs of life are found to be so few and simple that when one comes back to the paved streets, the wooden or stone floors with carpets on them, and all the other artificialities of civilized life, they seem like fetters and chains.

But the trouble is that we are too far gone to be able to endure the remedy. If we go to the forest we take an oil-stove and eat potted meats beside a mudflat full of clams. Corn parched on a flat stone and water from the brook are not sufficient for palates accustomed to bread made from "XXXX best white" flour, and tea or coffee at every meal. One party was known to bring back the nuts taken for lunch, "because they forgot the nut-crackers," and had not enough wit to use two stones. For what reason should we spend the strength of our lives in accumulating the "comforts of home" when proper living would give us such vigor and hardihood that most of those "comforts" would become irksome? It is an old saying that the best place for a library is in one's head, and it is true also that in the body the nerves might be so energetic and the muscles so firm that soft couches and padded chairs would be quite disdained.

# THE CHILDREN'S HOUR

Lomaland Photo. and Engraving Dept.

A GROUP OF THE YOUNGER RÂJA YOGA BOYS IN LOMALAND

## On, Gallant Company!

**T**HESE are young Lomaland warriors. Even in the dazzling sunshine you can read in their faces that they are drawn up in line to do battle for the Right.

The flag, the trumpet, the drum, the sword and the helmet mean a great deal to these little warriors. The flag makes them remember the Higher Patriotism and the ideal of Brotherhood they hold. The trumpet and the drum sound the call to duty and they arouse in every one of these stout hearts and strong little bodies a ready obedience. The sword to them means that they have found the knowledge of right and wrong. They know that if they always *do* the right when they see it they are forging a keen, bright sword that will cut them off from ever wishing to do wrong. Young as they are they have learned about the duality in their natures and their power to choose the good and let it rule. They are all working hard to polish their swords of right seeing and of will, and trying to use them promptly when evil is at hand so as to give the enemy no advantage. They are learning to be *ready*, and to use their swords with strength and skill. When they don their helmets these little warriors feel all the power to endure, and the protection of mighty unseen helpers that belong to Warriors for the Right.

Very happy hearts have these little Lomaland warriors. Music and sunshine and comradeship fill their lives with joy. Such a glad performance of little duties, such games and romps and telling of stories and singing of

songs as fill their days, would take a long time to tell all about. The new comrades from far-off lands must learn all the Râja Yoga songs, and then of course it is only courteous for the other boys to learn some of the songs of other lands, so the odd minutes are filled with this delightful sharing.

Then there are the long walks for the bigger little boys, sometimes in the sweet, cool mornings, before breakfast — there are no sluggards in this school. And the visits to the older boys' homes, where there are pets to see — doves, mice, and many others from time to time. These little Lomaland warriors wear the sword and helmet, and know their meaning too; but they have never seen anyone do anything cruel to man or beast, and their hearts are tender and loving. They know what Brotherhood is. As they stand there they are challenging all the other boys in the world to be Warriors for the Right.

GENTIAN

## Phosphorescence on the Pacific Ocean

**O**N the summer evenings in Lomaland the beautiful curving beach for miles and miles, as far as the eye can see, is lighted up by magic fire. Every wave as it comes rolling in is shining with wonderful light, blue, pale green, and white, as if millions of fairy lamps were burning inside. The line of the beach fairly glistens as the waves break on the shore.

In June the sun is highest in the heavens. Its rays fall straight down upon the earth. They are full of powerful magic. The mil-

lions and millions of tiny creatures who live on the surface of the sea feel this magic. At its touch they try to send forth again all that they may have caught from the sun's bright rays. Although each one of the tiny creatures is tinier than a pin's point, together they have caught so much from the sun that when it streams from them it lights up the ocean more brightly than the moon does. It is just as if at midsummer time all these tiny lives in the sea wished to show the great golden sun how much they love him by shining out in the darkness in this beautiful phosphorescent glow. For this is what the great ones love to see — every life, however tiny, giving forth the light it has.

## Three Friends of the Horse

**T**HERE is a man in New York who has been working fifty-four years in the cause of mercy to animals. He is the driver of a team. He began in the right way — by being kind himself, and never found it necessary to use a whip. At fourteen years old he began to drive a team for his father, who owned a large stable full of horses, but who never used a whip either! This kind old driver says that temper has much to do with a long life; that people who get into a rage with animals lose their health. It is an interesting fact that this driver, Daniel Collier, has a son John, who also began to drive a team when he was a boy. We can all guess what his training has been, with such a merciful father and grandfather.

### The True Key to the Bible

AMONG some critics of the Bible, of Jesus, and of Christianity, there is a tendency to swing from the extreme of implicit faith to that of complete skepticism. Neither attitude is that of calm judgment; the one is superstition or fanaticism, and the other is the first reaction therefrom. The Bible and the religious traditions connected therewith have come down to us through a multitude of human hands; and whatever their origin, it is but to be expected that in their present state they contain a mixture of truth and falsehood not easy to sift.

In the *Open Court* for March, in one of a series of articles on "What We Know About Jesus," the writer considers what he calls the "two kinds of teaching" in the Gospels. He begins:

The chief mode of approach to the personality of Jesus has always been, and must remain, through his teachings. Would that we certainly knew which, and which only, are his own!

He traces two kinds of teaching: the one being noble truths which, however, are by no means original with Jesus, but to be found in many an ancient source; and the other being teachings which reveal a strong tinge of current dogmas and beliefs. He thinks that, even if some of these latter passages were subsequently interpolated, still we cannot acquit Jesus, because he shows no dissent from them and even favors them. The idea of the Fatherhood of God, often credited to Jesus, was adopted by him from the thought of the time. But here,

We are obliged to notice the mixture of thought. It is a father up in heaven, a father who tempts his children, a father set over against "the evil one."

Along with many passages illustrating the beauty of the teachings of forgiveness, seeking perfection within, human solidarity, etc., are quoted many evincing a spirit of threatening and severity, like those about hell-fire and damnation. The conclusion seems to be that Jesus was a teacher who presented anew many sublime truths and maxims familiar to ancient thought, but who was deeply imbued with prejudices and dogmas about damnation, cataclysms, and Messianic eras.

### Dangers of Dead-letter Interpretation

Now this results from taking the Bible in a dead-letter sense. The Bible, in common with many other Scriptures, is an allegoric record of ancient wisdom which has come down to us in an altered form, until, as H. P. Blavatsky says, it requires a Daniel to interpret it. To quote from H. P. Blavatsky:

The primitive writers of the *Logia* (now the Gospels) knew certainly the truth, and the whole truth; but their successors had, as certainly, only dogma and form, which lead to hierarchical power at heart, rather than the spirit of the so-called Christ's teachings. Hence the gradual perversion. . . .

Mr. Gerald Massey's belief with regard to the spurious character of Bible and New Testament, as now edited, is also the belief of the present writer. In view of the recent revision of the Bible, and its many thousands of mistakes, mistranslations, and interpolations (some confessed to, and others withheld) it would ill become an opponent to take any one to task for refusing to believe in the authorized texts.\*

Gerald Massey having called the Bible a "magazine of falsehoods," H. P. Blavatsky continues:

### All World-Scriptures Symbolic

Surely it is not a symbolologist of Mr. G. Massey's powers and learning who would call the *Book of the Dead*, or the *Vedas*, or any other ancient Scripture, a "magazine of falsehoods." ( . . . Mr. Massey knows the difference between the spiritual, divine, and purely metaphysical Christos, and the made-up "lay figure" of the carnalized Jesus. He knows also that the Christian canon, especially the *Gospels*, *Acts*, and *Epistles*, are made up of fragments of gnostic wisdom, the groundwork of which is pre-Christian and built on the MYSTERIES of Initiation. It is the mode of theological presentation, and the interpolated passages—such as in *Mark* xvi, from verse 9 to the end—which make of the *Gospels* a "magazine of (wicked) falsehoods," and throw a slur on CHRISTOS . . . ) Why not regard it in the same light as all the others, the Old, and, in a still greater measure, the New Testament?

All of these are "magazines of falsehoods," if accepted in the exoteric dead-letter interpretations of their ancient, and especially of their modern theological glossarists. Each of these records has served in its turn as a means for securing power and of supporting the ambitious policy of an unscrupulous priesthood. All have promoted superstition, all made of their gods bloodthirsty and ever-

damning Molochs and fiends, as all have made nations to serve the latter more than the God of Truth. But while cunningly-devised dogmas and intentional misinterpretations by scholiasts are beyond any doubt, "falsehoods already exploded," the texts themselves are mines of universal truths.\* [The last italics are the present writer's.]

To interpret them, it is necessary to widen the field of view and study religion and religious symbology generally. Otherwise we shall continually revolve in the same narrow circle. As H. P. Blavatsky says in the work quoted above, there are students of *archaic esotericism* who have studied world-religions; and though none of them has yet mastered all

\* *The Esoteric Character of the Gospels*, "Studies in Occultism," No. 5.

the "seven keys" that open the great problem, they have discovered enough to be able to say:

There was a universal mystery-language, in which all the World-Scriptures were written, from *Vedas* to *Revelation*, from the *Book of the Dead* to the *Acts*.

**A Universal Mystery-Language** The groundwork of the New Testament is the same as that of the *Vedas*, of the Egyptian theogony, and of the Mazdean allegories.

The atonements by blood—blood-covenants and blood-transferences from gods to men, and by men as sacrifices to the gods—are the first key-note struck in every cosmogony and theogony. The words, "Verily, verily, I say unto you, except ye eat the flesh of the Son of man and drink his blood, ye have no life in you,"\* whether said by Jesus of Nazareth or Jeshua Ben-Panthera, are the words of an INITIATE.

We have therefore to study the ANCIENT WISDOM-RELIGION and its symbolical language; and we have for sources a great variety of ancient Scriptures of various peoples. If the passages about flesh and blood and sacrifices and fire are to be taken *literally*, we must either repudiate them or build on them savage and foolish doctrines. When we find the same kind of passages in Hindû books, we are shocked at the superstition of the "heathen." It is the same with matters not generally classed as religious; and,

**The Conceit of Modern Ignorance**

with a truly marvelous lack of the sense of humor, modern history books still jeer at Pythagoras for having, as alleged, "persuaded an ox not to eat beans." We ourselves have many metaphors both from animals and from food, and it would be only too easy to make up ridiculous anecdotes based on the literal interpretation of some of them. It is not worth while to spend so much labor in verbal analysis of passages while ignoring the obvious light which a wider range of study can throw on the whole question.

The Theosophical teachings of Kâmaloka, Reincarnation, the Seven Principles of Man, etc., teachings that can easily be discovered by sifting the various World-Religions, throw an entirely new light on the Gospels. Purification by "fire" becomes a necessary ordeal undergone by the Pilgrim on his path to the Light—not a horrible threat of divine vengeance. And so with many other teachings.

STUDENT

### The Bond of Masonry

A CONTEMPORARY recently had a well-written article on "The Attraction of Masonry." Taking the average Lodge life of a Mason as seven years, it traces the influences that tend to draw him out of working touch with his brethren, or that keep him at their side.

There is the social aspect of the Organization, the good-fellowship, even the conviviality. This is certainly one of the casual and temporary influences. It will wane as soon as the man finds himself in some other circle of friends and acquaintances that offers equal opportunity for social intercourse.

So too, is that tie casual, though more lasting, which consists in regard for the benevolent institutions under the control of the Fra-

ternity. For similar institutions exist outside its borders; they are not specific.

Ambition is in some cases the secret of apparent loyalty. But it has its limit of attainment, and when that has been reached and the period of office closes, the pseudo-interest in the Order will quickly wane.

There are other minor motives:

The Masonic critic is attracted to Masonry because it affords an opportunity for the exercise of his "critical" powers. He goes from lodge to lodge to see the "perfectness" with which an officer does his work. . . . He does not behold the beauties of the degrees, but is attracted solely by the desire to criticize.

All these and others belong to a man's casual ties with Masonry. They are not specific to Masonry itself. What is that, asks the writer, which keeps a man year after year a regular attendant at all the work of his lodge, work which, to one whose tie is not real, must become utterly monotonous?

It is because

There is an inexhaustible mine of truth beneath the veil of Masonic symbolism, and it is by patient investigation that it is explored. There is no gain-saying the fact that the degrees are full of seed-thoughts that make the reflective mind hunger and thirst after more.

As Grand Master Day pointed out in an address some years ago, the roots of Masonry and its ritual go back through the crafts and sodalities of the Middle Ages to the Mysteries of all the ancient nations. The ritual is therefore the pictorial embodiment of the highest thought of antiquity as to man and his destiny, his soul and his God. It is infinitely rich in suggestion, appealing to the student of religion, of philosophy, of mysticism, of psychology; to the antiquarian and historian. And an Order whose roots reach so far back, and into so many strata of time and thought, possesses an indefinable something to which nothing of more modern origin can lay claim. The thought and aspiration of the past has a living and protective and inspiring influence about it, an influence felt by many who perhaps hardly grasp in its fulness the meaning of the devotion that touches and elevates them. This is the specific tie to Masonry, and those who have and develop it are those that remain with it, and add the force of their thoughts and will and devotion to the accumulated forces of the past. Masonry is therefore essentially indestructible, for it arises out of the very constitution of man and is permanently capable of answering his spiritual and mental needs. It is the universal pictorial language of religions as music is the universal language of feeling. And as time goes on, music will doubtless take a fuller part in its work. R. A. M.

### Physics and Metaphysics

THE following are suggested as definitions to preface a text-book on popular scientific conceptions. They are warranted free from cant.

What is space? Space is a spherical room, about half a mile in diameter, and filled with a semi-transparent gas.

What occupies this space? Stars, planets, material objects, and atoms.

What is an atom? An atom is a spherical particle of greyish-brown stone, about as large as a small pin's head.

What do the atoms do? The atoms move about.

What moves them? Motion. (Please do not stare so.)

What is attraction? Attraction is when two atoms get closer together; when they get farther apart it is called repulsion.

What is heat? It is the effect produced when the atoms move about very rapidly.

What makes them move about in this way? Heat.

Then heat is both the cause and the effect? This is a metaphysical question and science has no concern with it.

What are the other forces which we see manifested in matter? They are the effect of various kinds of motion in the atoms.

What makes the atoms move in these various ways? Affinity, inertia, and so on.

What are affinity and inertia? They are those properties in virtue of which atoms attract each other and offer resistance to forces.

What is force? That which induces motion in mass.

What is mass? That which offers resistance to force.

Of what components is force made up? Motion and mass.

Humph! Thank you!

The word "Metaphysics" appears to be used in two senses: first, it is the science of real existences as opposed to phenomenal existences; second, it is the science of mental processes. Taking it in the former sense, we infer that the science of physics deals with phenomenal existences, which, being opposed to real existences, must be unreal. It is sufficiently evident that the phenomena studied by science are unreal, since they are reducible only to elements which are outside the scientific sphere altogether. "Mass" and "motion" are undiscoverable by the eye of physics. They exist on another plane.

That which moves matter is *will*. Physical force is manifested only when the matter has been moved. It is the result, not the cause. For the physical definition and conception of force necessarily include the idea of mass. Without mass there can be no physical force. How, then, can force be said to move mass?

It is important to bear in mind that science, so far from vindicating materialistic views, actually demonstrates the reverse. For it analyses the universe down to a point where it is absolutely essential to postulate mind and will. When we have got things reduced to a swarm of atoms floating in space, and every known physical force has been used up by being explained as a *result* of the motion of these atoms, what is left to explain the motions of the atoms? Nothing but mind and will. The All-Father may be ultimately responsible for the whole, but he does not poke up every individual atom with his own almighty finger any more than he *personally* instructs every bird how to build its nest. These mysterious atoms, upon whose tiny rounded shoulders science has finally heaped up the whole weight of responsibility, have been endowed with their share of the universal will and intelligence. They are the little gods of the physical world. But are they so little? Only in a physical sense, and perhaps all the greater for that; for there are dimensions other than physical; how large is a purpose or an idea? And the "space" of physicists is really no more than a diagram on which to plot out plans and designs. How much room have we got in our minds? Can that be measured in inches and miles, whether linear, square, or cubic, or be plotted in diagrams? STUDENT

# Some Views on XXth Century Problems

## Down to Pragmatism

PROFESSOR HÖFFDING, of the University of Copenhagen, has been giving a sketch of the progress of Christianity—downwards or upwards it would be hard for the reader to say—from the “earliest” Christian times to now, or nearly now. The gap expressed by the *nearly* is equally interestingly filled by Dr. David Starr Jordan. Says the former:

The morality of primitive Christianity was determined by the ardent awaiting of the second and immediate coming of Jesus. . . . The result was that men ceased to consider terrestrial and human conditions. . . . A state of expectation, inert but intense, was the essential condition of the soul. . . . The only important thing was to be ready to receive him (Jesus) when he should appear in a supernatural manner in the heavens. Such preparation was all that mattered.

That was the first stage. But men had to live in the common world and get an occasional slice of physical bread and butter. The Church came to the rescue. She provided in the monks and nuns, a class who should pursue the intense expectancy business; the priests, who stood midway between these and the common people; and the latter, who had just to believe what they were told and expect nothing particular.

The next stage consisted in the appearance of Protestantism, which arranged for the “emancipation of life in general in regard to the authority of the Church. Life in the world was no longer to be considered inferior to life in the cloister.” And within the limits of Christianity, anyone could believe what he liked.

The last, and present, stage is depicted for us by Dr. Jordan:

Religious philosophy . . . has long tended in the direction ticketed by philosophers as Pragmatism. Whatever will work in the conduct of life, strengthening it, enriching it, giving it a higher trend, must, so far as it goes, have elements of truth. To the average American the creeds are mostly harmless.

We are not obliged to read them, and if we do we cannot understand them without an understanding of their historic background. They are, in fact, only interesting to the scientist, to the student of religious fossils. You believe, if anything, what you like; and if your conduct, influenced by such belief, appears to you satisfactory, it follows that your belief was a “true” one. Pragmatists usually write the words *true* and *truth* within quotation marks. They are concessions to the vulgar, for “nothing is essentially true or untrue.” If a man finds himself inspired to conduct which appears to him good by the belief that the moon is made of green cheese, the moon is so constructed; his belief is true—for him. Everything has taken St. Paul’s advice, and is all things to all men.

Thus we get the steps from “early Christian” rapt expectancy to modern Pragmatism.

If it had not been for the man who wrote *The Acts*, and especially the first chapter, Christ’s “second coming” would have been interpreted as he taught it. Paul had the right

of the matter when he spoke of the birth of the Christ in the hearts of all who live the life; that is the “second coming,” the coming of the Christos, of illumination. Readers of the first chapter of *The Acts* with its account of the ascension and the statements of the two “men in white apparel,” have read this back on to the words of Christ and lit these up with a wholly false light. Those who had really understood Christ must have originated a stream altogether distinct from that which has led onward inevitably to modern-day Pragmatism, a stream which possibly never bore the name of Christian at all. And if we, in our turn, would understand him we must take the gospel pictures and place them in the series of pictures of all the other world-redeemers and teachers. Every nation has had its Christ, its incarnate Light, and all these have taught one doctrine under many forms. For the Light is one and the Truth is one.

And the object they all had in view was to teach man how to live this life in purity and joy. When we find a creed teaching men to look away to another sphere, away from that into which Divine Law has drawn them, we can be certain of interpolating foreign hands, of addition and distortion. This is the first step in the degradation of the doctrine of that teacher; the other steps, down to Pragmatism, we have seen.

STUDENT

## Mysticism

AN earnest little book on Mysticism—entitled, however, *Quakerism*, and by a Quaker of Pennsylvania—provokes even the London *Spectator* to admit that

Men long eagerly to know . . . whether in this world even it is possible to pass from death into life, and their longing will not be appeased or quenched by the settlement of the Johannine authorship or the date at which the story of Lazarus was first committed to paper.

The mystical current must have grown pretty strong to have passed into the respectful cognizance of the *Spectator*. It is a current bearing the seeds, if not of a new religion, at least of religion anew. And if that reborn religion is to bear the name of Christianity, Christians must awake to what is in the air. For the air now holds the *answers* to the questions men are asking. But it blows not inside the churches.

God is to be known, says Theosophy; it is possible and easy to pass *in this world* “from death into life.” But the path to God is through humanity; the divine can occupy that place only in the heart which is left vacant by the dispossession of selfishness, even spiritual selfishness, the desire for personal salvation and immortality and illumination. Here is the Theosophical statement from H. P. Blavatsky:

In order that one should fully comprehend individual life with its mysteries, he has to devote himself with all the fervor of unselfish philanthropy and love for his brother men, to studying and knowing collective life or Mankind. He has to decipher, understand, and remember the deep and innermost feelings and the aspirations of the poor

people’s great and suffering heart. To do this he has first to attune his soul with that of Humanity, as the old philosophy teaches; to thoroughly master the correct meaning of every line and word in the rapidly turning pages of the Book of Life of Mankind and to be thoroughly saturated with the truism that the latter is a whole inseparable from his own *Self*.

How is God to be conceived? Never, of course, as a person. The attempts at a conception usually start with the *mind*, with thought, and afterwards give birth if they can to a feeling. Let us do it the other way. The knowledge of God begins in an immense friendliness, compassion, love, for humanity, the *n/ith* power, as it were, of the state when for a few moments a few gathered together, feel themselves in perfect unity, a unity so deep as to compel silence. Waves of such inner unity, spreading from various centers, are even now making hidden groups among the inner selves of men though they may never have met and though their outer or mental selves know nothing about it—save perhaps as an inexplicable added goodwill to their fellows. It is these waves that constitute the cause of the rising vitality of mysticism.

It may not seem to mean much to call them the Spirit of God in man; but that is nearly as much as mind is now entitled to say about them. Originating them and letting them go through him, is a man’s one possible path to God, and also his one possible means of eliminating selfishness, and his one means of gaining real knowledge about life and real self-consciousness.

## Public Hypnotism

SOME German towns have recently made public exhibitions of hypnotism illegal.

One would think that even in this country a few minutes of Congressional time might be spared for a one-clause Act of the same sort. There can hardly be as yet a vested “interest” involved. Even if there were, no single voice would venture to raise itself in defense of these debasing exhibitions.

In some cases the performers take about with them a victim whom their repeated operations have almost robbed of the last gleams of human initiative and will. For his sake alone the prohibitory Act would be worth while. Idiocy or complete mental decay is no infrequent sequence.

But what proportion of the audience proceed forthwith to imitate the demonstration in their own private circles of acquaintance? How many fathers among their children? How many young men “just try it” upon their sweetheart? And with what sequence? In mere self-defense society should arouse itself to the danger.

Except on the children the attempts are fortunately mostly failures. But a proportion are successful. The successful operator pursues and widens his field of work, weakening, however slightly, the will and moral nature of each of his patients. The ripple of cause and effect widens beyond all measurement. C.

## The Illustration

THIS fine statue, which is said to be that of King Parakkama Bâhu, is near Polonnaruwa, southeast of Galvihâra, Ceylon. It is 11 ft. 6 in. in height, carved out of the solid rock. H. W. Cave, in *The Ruined Cities of Ceylon*, says:

"The monarch, who raised most of the temples and monuments of the city, stands with his back to his great works holding an olla, or palm leaf book in his hands, as if at the end of his glorious reign he had found in the study of the Buddhist scriptures his final consolation." B.

## Christian Doctrines Borrowed from Egypt.

THE sarcophagus of translucent pink alabaster, of Seti I, found in 1815 by Belzoni in the great Royal Tomb in the Valley of the Kings, Thebes, is preserved in the Soane Museum, London. This Museum was bequeathed to the nation in 1837 by Sir John Soane, and is but little known even to foreign visitors, much less to Londoners.

The corridors and walls of the Theban tomb penetrate 350 feet into the mountain and to a depth of 180 feet; being painted with figures and scenes by the best artists of the Theban school. The chamber of the sarcophagus is 58 feet by 27. The sarcophagus is cut out of a block of golden pink alabaster from the quarry of Het Nub near Tel-el-Amarna, and measures 9 feet by 3 feet 8. The cover has been broken by tomb robbers and the jewels probably stolen. There was no mummy in the coffin, but in 1872 the mummy was found, together with those of Ramessu II and many others, at Deir-el-Bâhari. They had been hidden, it is said, by Prince Anu-peth, son of Shasank I, in B.C. 970. The coffin is covered inside and out with scenes from a ritual, the same as is inscribed on the walls of the tombs, and called "The Book of Tûat," and the "Book of Gates."

This record has been described in a booklet issued in connexion with the museum; and (as one gathers from an article in the *London Globe*) Tûat has been called the Egyptian Hell or Hades. It was dark and filled with fiery rivers, pits, and lakes; the wicked were tortured, the good rewarded, and it was not underground. It was an "imaginary" region through which the Sun-God passed during the hours of the night; hence its division into twelve sections, each of which had its gates guarded by serpents. The Sun-God "weighed words and deeds, and made a distinction between great and little gods, and assigned seats of honor to the spirits, and dismissed the damned to the place which was set apart for them, and destroyed their bodies there." As he passed along, the good who had worshiped Ra on earth stood at his right hand and were fed with celestial food. So also those who had lived justly were fed on truth, and ate the bread of everlastingness, and drank pure cool water. The wicked are

Lomaland Photo. and Engraving Dept.

depicted bound or beheaded, cast into lakes of fire, or devoured by the serpent Kheti.

*The bread of everlastingness, on which the spirits fed daily was the body of Osiris, and they thereby became united to him and were called to the "Land of Enjoyment" in the "House of Life and Righteousness."*

Christians will not fail to notice the strange similarity between the symbolism of their religion and that of this far more ancient ritual. It has often been pointed out that the sacrament of the "Lord's Supper," whether ever actually celebrated in Judaea

by Jesus or not, was not invented by him as the Church afterwards claimed. The fact of its "pagan" origin was known and even admitted by some of the early Fathers, but conveniently forgotten afterwards, though we continually come across reminders like the above.

But we are *not* saying that the Egyptians invented it either. For it would be easy to trace the same symbolic ritual to other nations of antiquity. It is indeed part of the ancient and once universal Wisdom-Religion.

The doctrine of Heaven and Hell also finds its explanation here; and that again is no more exclusively Egyptian than it is Christian, but universal. But in the older times the real meaning of the teaching was understood, and it was only later ignorance that transformed it into a doctrine of damnation for the bulk of humanity and of undeserved reward for the few.

At death, the Soul passes through purifications, during which the dross of the lower nature is purged away and consumed, and the Soul passes to its place of rest and refreshment between incarnations. If there be any who have so given themselves up to evil that they have severed the connexion with their immortal Self, then they are destroyed with the destruction of the lower elements with which they have become identified.

The law of Karma is depicted in the judgment by the "Sun-God" who weighs words and deeds. The passage of the Sun-God through these twelve regions of the underworld during the hours of night evidently refers to the day and night of a whole human life, not to the lesser cycle of a natural day and night. When the sun of a man's life sets, the earthly life ceases; and, as in sleep, there is a separation between the animal life and the consciousness within; the grosser elements are purged away and the Soul is refreshed—until the night is over and a new day begins.

This beautiful and rational teaching, so full of hope and mercy, has been corrupted by the dark imaginings of unenlightened minds into the fearful and irrational dogmas of eternal damnation and eternal heaven; doctrines invented by the people who destroyed all they could of this ancient civilization. But many of its buildings were too truly laid for them to destroy; and

its teachings, though forgotten, are no more dead than the Souls which tenanted the bodies we unearth.

Ancient beliefs sound superstitious as interpreted by modern scholiasts, who alone are responsible for the words in which the pictures are described. They suffer by the attempt to reduce them to our own comprehension; for what superstition could be greater than that of people who cling so fondly to that strange compost of mutilated fragments which is all that has been allowed them by the destroyers of Religion! Little do they know of the heritage that has been kept back from them. STUDENT

# ✻ The Trend of Twentieth Century Science ✻

## Mystical Materialism

TO have materialistic formulas and pictures of the universe, is not necessarily to be a materialist. Nor does any amount of talk of the soul and of spiritual things guarantee your spirituality.

The old naturalist John Burroughs contributes to a contemporary article which is a curious example of a spiritual mind doing its best to be materialistic. But it fails almost amusingly; the man's fine soul gets its touch on every word.

In time, he says, we shall all have to accept the theory of the mechanico-chemical origin of life:

It is at first an unpalatable truth, like the discovery of the animal origin of man, or that consciousness and all our fine thoughts and aspirations are the result of molecular action in the brain; . . . We shall probably be brought, sooner or later, to accept another unpalatable theory, that of the physical origin of the soul, that it is not of celestial birth except as the celestial and terrestrial are one.

Words that might have come from the most progressive biologist that ever dissected a tadpole to solve the secret of its life. But along with this he says:

We lose the God of a far-off heaven, and find a God in the common, the near, always present, always active, always creating the world anew. . . . This is really only taking our religious teachers at their word, that God is here, as constant and as active in the commonest substance we know as in the highest heaven.

His "matter" is not a set of little hard round things, carrying electric charges. It is something *alive*, about to wake, or smiling in consciousness of its own life, divine. Yet the word is the same for the two concepts. Finally he brings himself up in silence. Mind has, he is aware, reached *its* limit, but that is not *the* limit:

I seem to see dimly that you cannot bring the Infinite to book, that you cannot ask, What for? of the All—of that which has neither beginning nor end, neither center nor circumference, neither fulfillment nor design, which knows neither failure nor success, neither loss nor gain, and which is complete in and of itself. . . . The Unspeakable will not be spoken. . . . All that which in our limited view of nature we call waste and delay—how can such terms apply to the Infinite? Can we ever speak truly of the Infinite in terms of the finite? To be sure, we have no other terms, and can never have. Then let us be silent and—reverent.

That seems to go pretty well with some sentences of H. P. Blavatsky's:

The only God we must recognize and pray to, or rather, act in unison with, is the Divine Spirit which no language can describe and which the mind in its limitations cannot comprehend, but the fire of whose divine energy we can feel in our hearts awakening us to right action and illuminating our pathway.

It cannot be said to have design. But it does not therefore follow that design is absent anywhere in the whole field of nature. Says Professor Chamberlin, of Chicago University, in a recent article:

It is one of the latest conceptions of geology that climatic conditions have been of the same order as at present from early eras, in the large view, in spite of some notable variations, and that this uniformity is the result of a *profound regulative system* which has sufficed to keep the temperatures of the earth's surface and the constitution of the earth's atmosphere within the narrow range congenial to life for many millions of years. (Italics his.)

Theosophy teaches that this and many another "profound regulative system" in nature are the work of beings higher than man, who *have* design. Their design, which is evolution, works out into visibility as the laws of nature which render evolution possible. Their design, which is prompted by a feeling which in us becomes compassion, is collectively arrived at and carried out. Like ourselves, they are within the field of the Infinite. *Its* "fire of divine energy," formless and without content so far as mind is concerned, takes in their minds the form and content of the design and through that mold streams beyond them into nature and into man's mind and heart, teaching him his duty. As he awakes to his duty and to compassion, he becomes a conscious helper in the carrying out of the general design.

## The Elemental Thinker

AN interesting little experiment is reported from the Sorbonne physiological laboratory in Paris. The patient was made to look with one eye at a diagram on a piece of paper, in front of the eye being a convex lens. The paper was then moved away until the diagram was just distinguishable. This distance was of course considerably shorter than it would have been without the lens, for the more convex a lens the nearer to it are distant rays focussed. The lens was then removed and the paper taken farther and farther from the eye until the diagram was again just distinguishable.

In viewing distant objects the pupil dilates so as to admit as much light from them as possible. But in this case, though the object was by measure more distant, so far as the eye was concerned its distance was the same as before, the image as clear and sharp. Yet the pupil had dilated exactly as it would if, no lens having been used, the eye had to follow a receding object. In other words it had perceived that the object was as a matter of fact more distant, and had concluded on its own account that dilation was necessary. It could not understand, of course, that the use of the lens had rendered the two distances—so far as it was concerned—the same. Says M. Boyer, reporting the experiment: "the dilatation of the pupil must have been the result of a cerebral reflex action excited by the *idea* of distance." (Italics ours.) This idea was in the physiological consciousness, a very wise and in its way thoughtful and purposeful consciousness, one that does a great deal of planning and thinking of which the *man's* consciousness knows nothing at all. It can of course be deceived, as in this case.

Nor, when it has good grounds for being deceived, can it easily be undeceived by its human master. The channels of intercommunication are limited and ill understood—fortunately for us, for this elemental mind can best do its business without our interference. However much of a scientist might have been this patient, however fully he might have known the laws governing the convergence of light by lenses, he could not have conveyed to his physiological thinker his knowledge of the non-necessity for dilating his pupil. It knows some science, more than we do, but in quite another way—from inside as it were.

STUDENT

## The Universal Thirst

AMONG the other fates that await the human race is that of death from thirst.

The rainfall has been diminishing ever since the Glacial Period and will ultimately become nothing. Perhaps it has been a profound intuition of this coming fate that has led large portions of mankind to try to substitute alcohol for water.

The melancholy fact is pointed out to us by a French meteorologist in the *Bulletin* of the Calvados Meteorological Commission. He leaves us no hope:

The progressive diminution of rainfall is a fact that is becoming better and better established and even universally known. As meteorological observations are perfected and prolonged, the phenomenon is more and more certain and forces itself upon our notice.

In many places it would seem that there are long oscillations, extending over thirty years, during which the rainfall increases, followed by other thirty of decrease. There are also indications of other cycles, overlapping and overlying. But the whole tendency is to decrease. The surface waters are disappearing into mighty reservoirs lying deep somewhere in the crust.

Surely we know too little of the earth's physiology for any such conclusion. If a man walks past one of my study windows and in a couple of seconds past the other, must I conclude that he will continue in that line until in thirty hours he walks into the sea? From the last Glacial Period to 1908 may be one half of a still larger rain cycle, whether 10,000 or 80,000 years long, up to the beginning of which the fall may have been increasing and from the end of which it will increase again. If there be a deep reservoir or water cloak, some tilt in the axis may cause changes enough in the crust to expel it. If the nucleus of the earth is contracting away from the crust and sucking water into the space, the crust may fall in somewhere and squeeze the water out again. We know almost too little even to discuss the matter. The earth exists for the evolution and perfection of the life upon it and may be relied upon not to spoil the program. The man who passed my windows turned to the right at the end of the next fifteen yards, as he had intended from the time he left his house.

## The Alaska-Yukon-Pacific Exposition

THE Alaska-Yukon-Pacific Exposition, for which a Government appropriation of \$600,000 has been made, is progressing, buildings being in course of erection and applications for concessions and exhibit space pouring in. The exhibition is to be held at Seattle in 1909; and besides the main building, there will be structures for Hawaii, Alaska, the Philippines, and the fisheries. There will be an amusement avenue called the "Pay Streak," which is to be lined on each side with exact reproductions of famous totem poles, the faces illuminated at night by electric lights; and the entrance will be an archway in a combination of Chinese and Japanese architecture.

An exhibition of motor boats on Lake Washington will form an attractive feature. Another feature will be an exhibition assay office for gold, showing the whole process from the rough ore to the purified metal for determination. Seattle has already been doing a large business in gold-assaying, and some of this will be transferred to the show plant.

## A Bit of Old England

OF all the rural counties in England few have retained more of the old English atmosphere than Hampshire. It includes Southampton, the first British town seen by thousands who come by the liners that make that port their place of call, but most of the travelers pass through the county without suspecting its beauty or historical interest. Hampshire has the glory of containing the royal domain created by William, Duke of Normandy and first Norman King of England, the famous New Forest, whose natural beauty and harmonious wildness have been left practically untouched for the last 800 years. It contains plenty of picturesque open heath country, but the great woods of oak, beech, and yew are the primary attraction for the artist and nature lover. Their unspoiled majesty carries the imagination back to the

Lomaland Photo. and Engraving Dept.

## AN OLD COTTAGE AND WELL IN HAMPSHIRE, ENGLAND

time when the white, blue, and green-robed Druids held their solemn ceremonies within their secluded glades and man lived nearer the heart of nature.

The New Forest is the home of an immense variety of British plants, including the Royal Fern (*Osmunda regalis*) and the curious carnivorous Sundew, which supplies the lack of nitrogen in the soil where it grows by a diet of flies. A profusion of animal life, rare butterflies, and innumerable birds rejoice in the protection afforded by the trees. But the Forest is not the only natural glory of Hampshire; there are so many delights of a quiet sort that it is difficult to know upon

ly cropped grass with here and there a few juniper or gorse bushes. In places you may come across a "fairy ring" of richer and longer grass, where the elves dance on festival nights—but the old people say the railroads have changed all that now—and on the smooth green summits of the Downs the ancient British chiefs sleep in peace under their barrows or tumuli. The natural charms of Hampshire have employed the pens of some of the finest writers, such as Gilbert White, whose *Natural History of Selborne* is a classic loved by all who have hearts to feel the magic of out-door nature. Yet judging by recent books the subject is inexhaustible. STUDENT

## ANSTEY'S COVE, TORQUAY, ENGLAND

## Torquay

TORQUAY is well known to all Englanders as a beautiful and healthful resort. It is in the southwest, on the south coast of Devon. Open to sea-breezes on the south, and screened by hills on the other sides, its climate is equable, the temperature seldom rising above 70° in summer or falling below the freezing-point in winter. The sea air is very balmy and the scenery of this part of England quite entrancing with its combination of rugged hills and luxuriant verdure, its lanes and rippling brooks. H.

### Genius and Morality

"GENIUS on earth is God giving himself."

The truth of this is felt by every hero-worshiper; and who is *not* a hero-worshiper? Who is there that cannot find in the march of the ages a great soul whose work on earth stands out as a headland, something to look back upon for inspiration, something that has still the power to lead him on because, though it is long past, the vision of perfection is incarnate in it and appeals to that in man which longs for the sublime and beautiful, and knows that they must be expressed in life? Hero-worship is verily, in the true sense, the worship, not of the personality of the genius, but of the God that can be felt in his work. The ancients who in many respects had a deeper knowledge than we of the constitution of the human being, knew this well, and in their ceremonies, provided occasion for the expression of this most natural desire to do homage to the God made manifest in the works of men of genius. The discrimination, possible to those who possessed the Truth concerning the nature and principles of man, loses its edge among those who have not this knowledge, and in an age in which personality is glorified at the expense of individuality, the God within is lost sight of, the true significance of genius is no longer understood, its relation to morality is forgotten. Wonder and worship remain, for the heart of humanity is sound at the core, and true genius being of the heart and soul and mind of the universe finds an echo wherever intuition has not been superseded entirely by an intellect unlighted by fire from the heart and soul. Theosophy teaches the truths, long forgotten, about these mysteries of the God within, and awakens the power to unlock the heart, and by gradually purifying the encompassing sheaths, liberates this divinity that dwells in every man. Theosophy shows genius on earth to be the fruit of moral effort.

Genius and morality are not, however, indissolubly linked in the minds of men to-day. On the contrary, to many genius or what is looked upon as genius, is often accepted as an excuse for immorality. For long no comprehension and satisfactory explanation has been offered of the extraordinary contradictions and extremes evident in the lives of those credited with genius. The wonder and worship that are felt for all that transcends ordinary human power are so great, so real, that the moral failures and deplorable weaknesses of the great are regarded with pity and indulgence in many cases. What inspiration the works of genius afford is gratefully received, and what is inexplicable in the doers is put on one side. To minds that have not outgrown belief in a personal God, and special creations as the source of the different species of creatures to be found on earth, it

can not of course seem any more curious to believe that men of genius are also special creations, whose origin and manifestations of perfection mingled with imperfection need not be inquired into. But there are other minds that have outgrown creed and dogma and are striving to learn the law underlying the different manifestations of life. In these minds questions arise—"Why do children show the presence of a genius that fades out in later years?" "Why do poets and artists and musicians and leaders of men show masterful genius up to a certain point, and then fail, or exhibit in bursts of light, the existence of a flame that is later extinguished in besotted drunkenness, slavery to drugs, insanity, despair?" "Why is not genius granted to those steady upright, plodding members of society who have never offended against the laws of morality, and whose lives seem, on the whole, of perhaps as much benefit to themselves and others, as the lives of those who have genius, though not generally so capable of arousing wonder and worship?" Thinking minds require an answer to these questions. Great geniuses have not existed in vain. Even though dead they work. They show what is possible to man, and in the eager inquiries for an explanation of the flickering of the flame of genius, there is an aspect of practicality. These great things have been done on earth; we wonder at and worship the doers of them. This great gift—from God, from the Soul, whence is it? May it not be won for the race—for Humanity? *Why is every man not a genius?*

Theosophy answers all these questions. The teachings of wisdom that the ancients had and that H. P. Blavatsky brought back to the world, were that the complex organism of the human being was built up by several lines of evolution; that the highly evolved animal form at last reached on earth was endowed with mind or Manas by higher beings; that this gift of Higher Mind made of man a Being having responsibility not shared by the lower kingdoms—a potential God. When thus related to a body the mind is dual—its higher aspect linked to Universal Mind, not depending on reason; intuitive, creative, spiritual; its lower aspects linked to Desire, occupied with memory of feeling and sensations, dwelling on pleasure or pain, flitting from one thing to another, or dully passive, obscuring the Higher Mind by its faculty of picture-making born by desire. According as the human being masters the lower mind, leaving the Higher free to act, to shed its rays of soul-knowledge upon the mind unobstructed, we have "manifestations of genius." If the effort at control be carried on persistently and successfully, the brain may become a fit instrument, able to transmit the knowledge of the Higher Mind and give expression through the body as a vehicle to the exquisite harmonies of works of genius. Be body or brain impaired in any way, the less complete its possibility of transmitting from the realms above.

It is evident that many different degrees of attainment have been reached in mastering the lower mind so that the light of genius might shine forth. In considering any one life in which genius has been manifested the workings of Karma must be dwelt upon, for what the personality is, what its possibilities

and qualities are, depends on Karma, the acts and thoughts of past lives by which we have woven the destiny which meets us day by day. It is the law that pure thoughts and acts of a past life may so converge in lines of light that for a brief interval it is the happy lot of a mortal to be able to manifest the God within, and the world has a poet, an artist, a musician. It is also in the law that just as our acts and thoughts vary from hour to hour and day by day, so does Karma change; the good becomes exhausted, the fatal results of unhappy moments when in other lives men yielded to temptation, appear, the good moment goes, the clear mirror that reflected the higher knowledge is clouded by dark images from the past, the light is forced to withdraw, a man of genius has become the man of clay once more.

From our own lives we realize the workings of this. A moment of opportunity comes to us; now, if ever, we are determined to put forth all the strength that is in us, in high endeavor; we feel illuminated, ready; when the ghost of a past habit, an evil turn of mind we once indulged in, a murmuring of the physical body, a demand for the satisfaction of some petty desire allures us, and the moment of the Gods is gone. By every thought and act we are preparing for the continuance of this struggle between the spiritual man, the creative, divine, counterpart whose expression in act would lift us to the heights on which dwell the heroes whom we worship, and the lower man, keen as to brain power, alert as to gratification of self, but the enemy forever of the God within. The lives of those the world credits with genius illustrate in a marked manner the workings of this law, the struggle between the two aspects, the Higher Mind now free to transmit, the lower now rampant. It is useless to attempt to divert the struggle of moral significance. Genius is born from the moral conquests of past lives. It is only moral growth that frees God in us. It is past failures that return and make of the child who was poet and artist a miserable doubter of himself in later life; it is past failures returning to be faced that make a hero the victim of sudden ambition or furious passion. Fully developed is the genius of none of these, because perfectly purified have the sheaths of their souls never yet been. We look back with sympathy and comprehension when we have Theosophy as a guide. Genius has flashed out here and there as if to assure us that God dwells in man; the darkness followed as if to warn that the God was as yet imprisoned in the clay except for all too brief intervals.

The better we understand what makes the man of genius, the more clearly we see that morality and genius are closely related, and the more evident is the significance of the life that exhibits a steady high morality, an inner harmony with spiritual law and an outward harmony of relation. Here are conditions that lead to the flowering of genius, all in good time. Merely conventional morality, however, has no significance of this kind. It consorts with dogmatic thought and these are the strongest bars known against Genius. It is pitiful to think of the number of children whose bright angel stood at hand ready to inform and illumine, but was fettered for a

lifetime by narrow dogmatic teaching. Unsectarian schools, the teaching of the dual nature, belief in the divinity and its power to control the lower desires, remove obstacles from the way of the Higher Mind and give both men and children an opportunity to become their real selves. The light need not fade from their view; it should, and does, grow stronger, if they are rightly taught.

It will be seen that true genius, springing from the God-element in man, which only waits the opportunity of pure vehicles wherewith to transmit its illuminating power, has nought to do with an abnormally developed brain-mind.

William Q. Judge wrote:

The power to know does not come from book-study nor from mere philosophy, but mostly from the actual practise of altruism in deed, word, and thought.

H. P. Blavatsky said:

Original and great genius puts out the most dazzling rays of human intellectuality as the sun quenches the flame-light of a fire in an open field. . . . Only such a grand altruistic character as that of a Buddha or Jesus, and of their few close imitators, can be regarded, in our historical cycle, as fully developed GENIUS.

The cultivation that produces the flower of genius is not mental, but moral and spiritual. Mental powers may be trained and expanded, and in so far as this mental discipline proceeds side by side with moral and physical unfoldment, the human instrument can yield the divine harmonies played on it by the Higher Ego, which speak to us in poetry and music, art and works of compassion. Intellectual acuteness does not invite the Soul; unselfish service to humanity does. If the life is pure and compassionate, pure sheaths for the Soul are being built; and when in another life these hasten to clothe the babe that is to be born, innate genius, that nothing can longer fetter, enters the world with it. Can all thus win this gift from the Soul? Yes, when all learn to drop their chains and chase the devil of doubt from their natures. Fettered art workers, dumb bards, silent musicians, are all about us. By moral development, patient conquest of the lower self shall their souls be freed to express beauty in their lives. Worship the God in your heroes; learn and prove that there is a God in yourself.

STUDENT

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** How do you account for the appearance of great men at crises in a nation's life or in the world's history?

**Answer** Is it possible that there are, as one might say, national gods, supremely interested in the welfare of their people and detailed to stand especially guardians over them through the ages; able to foresee critical periods in their lives, and to come into bodies in advance, so as to be at the summit of power when most needed?

If we only understood the wide truth and mystery of brotherhood, worlds and worlds of philosophy would be made clear to our vision. For this is no mere ethical precept, no mere

safe means of coming at heaven or salvation, no pious sentiment; but the core and acme of philosophy, the explanation of all existing things. It is the key and pattern of all relativity, the road out from ego into non-ego, the solvent of limitations and the scheme of the universe. Between us human beings there are no dividing lines, but fine shadings off and mergings; so that my being and yours are not so widely distinguishable but that the two do coalesce on some inward plane or another; and your knowledge and experience, if I knew how to obtain it, were my own; none of us has any diamond mine within him but the rest may come in and be enriched; for all the ultimate spoils of the universe to which any man has access are open to another and to all others, provided this law of laws is known and complied with.

But it is no cheap political scheme, no matter of Jack as good as his master, this; but a serious and in some respects intricate law. A sun rays out light and life to many planets, and is himself recipient of both from some more central radiating heart. The planets in their turn give life to myriads of inhabitants; the bodies of these, again, are organic, each organ having life and consciousness of its own; the organs are worlds with cells for their people, each cell being a life, an entity, a container of some measure of consciousness; each subsidiary to its organ, as the organ is to the body; each organ too, being built around one foundation- or key-cell which is the sun and heart of it. So we are enabled to see that no system can exist without its central sun, its pivotal place in consciousness through which its whole being draws light and life from the world above it — and why should it not be the same with the nations of the earth?

Would it be a far-fetched idea, that the nations are organs of the body of humanity, through which the World-Soul manifests, each having its special task, color, mission? Each alone able to accomplish some particular thing, alone able to make some necessary contribution to the work humanity has to do? We may picture to ourselves the life of this organ or that one threatened by perils; either from enemies without, or from some insidious *zeitgeist* within, as the spirit of money-lust, an "insurrection of vice and injustice." Then some call must go forth to the white corpuscles of the race, that they rise and do their duty valiantly, or else nature's harmony and balance would be outraged. There is a fundamental law that the universe *will have* harmony, *will set up* counteracting agitation whenever harmony is menaced; will force its restoration (by such means as we call suffering and punishment) whenever it may be broken. So a light shines down into the central cell, and the Great Soul is incarnate.

A cell is an ideal form, and myriads of atoms momentarily attach themselves to it, fall into their places, accomplish (we can have no real philosophy unless we grant this) their purpose in going there, and then fall away to give place to others and others, themselves meanwhile hastening on to other classes and duties. That some such center of spiritual and energetic vitality exists in each nation seems to be a reasonable, if not an inevitable conclusion; and that center would be the na-

tional god or goddess, the favorite and most worshiped deity, from whom the chief inspiration was drawn. Of old they taught that the gods incarnated at the hour of a nation's need. We highly superior people of today are apt to call such ideas mere poetry, and our courts have pronounced a divorce, willy-nilly, between poetry and truth; such pronouncement, of course, being only satisfactory to ourselves. For the two are one, and many times, truth can only be approached through poetry.

A new nation is born, groups itself around the divine cell, and comes, through his will and courage, into existence. Then for awhile that cell appears to be dormant, no especial call being made on its radiant activity. Then comes another period of crisis, and the light is seen to glow within it again and another great leader comes forward. We do not mean to imply that these two were (or were not) the same entity, but the same mantle of divinity was about them. Such men are invested with more than human dignity, for they are inhabiting, spiritually speaking, the seat of the gods of their nation. Were the ancients so far wrong after all?

You will find such august men at all critical periods, either upon the throne or the cross, for Golgotha is their place more often even than the palace. They come; they protest; they light a little fire; restore a few to hope, remind a few of possibilities not yet quite extinct; and then themselves are slain. Yet these too, are kings; and the Crown of Thorns is more royal and significant than any of mere gold and jewels. For this is the true meaning of the old office of kingship; there was the place ready, into which the divine leader might incarnate when he would and need was. So incarnating, he was as the risen sun for the people, who were his planets, and had their spiritual life from him. He entered into a birthright, filled a certain place —

*Ra with his own crown crowned my head  
And crowning, made me one with Ra.*

The demand for him was an actual current which reached out until it found him; and his manifested greatness was dependent on the greatness of the need, of his mission, and of his people's ability to recognize him.

But the ancients taught that there were more deities than one; there were Ares and even Silenus, and baser figures still, as well as Zeus and Athene. Either class might come into the flesh and become dominant at times. Spiritual Quetzalcohuatl had grown dim on the Aztec horizon and grim figures had usurped his place before Cortés came — Huitzilopochtli and Tezcatlipoca, gods of war and bloodshed. They were not able to save the people. There is a dollar-deity somewhere, and he insists upon incarnating in that nation whose eyes are turned too adoringly and solely on the dollar. From such an incarnation we know what to expect; we have perhaps seen something very like it ourselves. No use rebelling against the manifestation; stop the sacrifices, stop the worship, and the bogey will fade away. Our hands make the fate of the nations. All our acts and thoughts are sacrifices to one god or another, and when enough tribute has been paid to any one of them, look for him to find a human body and dwell among us. Our hands make the fate of the nations.

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Camille Flammarion on Phenomena

CAMILLE FLAMMARION'S book, *Les Forces Naturelles Inconnues*, is noticed in a daily paper, from which we gather that it is the result of 45 years' observation of psychic and spiritistic phenomena. M. Flammarion argues on the absurdity of the skeptical position, which denies the possibility of any phenomena not explicable by current scientific knowledge; and says that on the same grounds, Fraunhofer's discovery of dark lines in the solar spectrum ought to have been rejected, while many other things which are accepted by science although they are not explicable ought to be rejected now. But if one is to argue on these lines, one might as well say at once what is the actual fact, that nothing is really explicable by the hypotheses of science; for that one greatest phenomenon of all—attraction, or action at a distance—is involved in every explanation. No action whatever can, according to scientific reasoning, be otherwise than action across an empty space (for any medium supposed to fill the space must itself be atomic); therefore no action whatever can be explained by science unless we are to regard as an explanation the wholesale assumption of this fundamental proposition. In view, therefore, of the utter inexplicability of even the simplest natural occurrence, why should scientists, if they go by reason, stick at anything Eusapia Paladino may do? Why is it more wonderful to move a distant object without contact than to move one's own arm? If force can leap from one atom to the next, or from Sirius to the earth, why cannot it leap across the room?

As a matter of fact, however, this is not the line of reasoning taken by the scientists, who (naturally enough perhaps) do not wish to extend the bounds of natural science beyond those limits wherein they themselves claim special knowledge and authority.

The phenomena which M. Flammarion has investigated are of the familiar kind, and it will be superfluous to describe them. He is convinced that many of the phenomena are genuine, though the theories given in explanation may not be; and he has a good deal to say about the complications introduced by fraud. On this one would say that sometimes the medium is of such an uneducated character

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

as scarcely to be aware of the fine distinctions drawn by the investigators between what is legitimate and what not; and that therefore the phenomena may be genuine or fraudulent or any degree of mixture. Also have there not been mediums, who, finding their powers failing them, have been compelled to gratify importunity or relieve necessity by the use of other powers, surreptitious, but not occult in the accepted sense?

It has been argued that if people could be convinced by phenomena of the reality of occult forces, they would become ready converts to the study of higher powers in general. But experience seems to demonstrate pretty fully that they would do nothing of the kind. On the contrary, they would continue to waste time in the pursuit of such trivial objects as these psychic researchers and spiritists appear to have in view. Should Jesus Christ himself come among us and do "miracles," it is not the miracles that would elevate the world to a standard of spirituality, whatever his teaching and moral influence might do. The miracles would only attract a vulgar crowd who would first idolize and then kill him. When H. P. Blavatsky founded the Theosophical Society, she temporarily set aside a general rule of Occultists, and for the instruction of her students, illustrated by a few phenomena her teachings as to the command which man can attain over nature. The result demonstrated the wisdom of the rule *against* showing such powers; any serious attempt to shake the world out of its ordinary bearings arouses such fear that there is a unanimous determination to suppress the source of the disturbance. H. P. Blavatsky accomplished her purpose of fastening her work indelibly on the attention of the world, and willingly paid the heavy price entailed on her by that sacrifice.

The only way to elevate mankind permanently is by appealing to the aspirations, sense of duty, obligations of love and service, etc.

Any attempt to do it by psychic phenomena makes trouble. If it were not evident, from reasoning that this would be so, the facts would suffice to demonstrate it amply. Wherever we find these phenomena, there we find vulgarity, suspicion, ignorance, and a generally unhealthy atmosphere.

M. Flammarion himself does not seem to have been inspired to any high ideas of the possibilities of human nature; his experiences have merely suggested a new branch of scientific inquiry. Men of science who have won a merited reputation for good work in their legitimate field are now engaged, it seems, in seriously undermining that reputation by plunging headlong into the whirlpools of "psychic research," which are bearing them far away from the path of usefulness and good sense into psychic quicksands.

The really worthy field of occult research is the field of one's Soul. The study of how to overcome the limitations imposed on the action of the true Self by the delusions of the mind and the chains of the passions, is indeed a study worthy of Man. To try to gain power over matter when we have not power over our own material passions and instincts is to court grave and certain disaster; for the powers which we unchain are stronger than our own will. While these reasons will appeal to the right-minded, there are many who care for nothing but the gratification of curiosity and pleasure and ambition, heedless of the rights of others and of *their own real interests*. It is well, therefore, that psychic phenomena should be surrounded with every guarantee of safety, for if they ever come into prominence, they will constitute such a danger to civilization that the people will be obliged to seek every means to suppress them. But what the people are to do in such an emergency it is hardly possible to say, unless they are able to avail themselves of some source of wisdom greater than any we find in the world today. *And this is one of the emergencies for which Theosophy has to prepare.* STUDENT

OUR reason must accept in all necessity an infinite and eternal Mind which rules and governs the ocean of life. . . . Thought and creative ideation, in full agreement with the laws of unity and causation, manifest themselves plainly enough in universal life without the participation of brain-slush.—*Memoirs*, by Dr. Pirogoff.

## Fungi Destroying Forests: Man's Responsibility

A WRITER on "Fungi Destroying Eastern Forests," in the *Scientific American Supplement*, begins with these dreadful words:

Practically all the chestnut trees of the Eastern States are dead, destroyed by a small deadly parasitic fungus, *Diaporthe parasitica*. . . In Prospect Park, Brooklyn, 1500 chestnut trees, and in the Bronx parks several thousand chestnut trees, have been cut out, roots, trunks, and branches, and burned. The government forestry service estimates that one-third of the pine-trees of New England are dead from a leaf blight.

A description of various tree fungi, with illustrations of them, follows. It would seem that there are over 30,000 varieties of fungi including the toadstool or mushroom type. Of those which attack live trees, some die when they have killed the tree, others continue to live on it. As the tree dies, new forms of fungus attack it, until it is a mass of fungoid growth, the punk itself being a fungoid disease. Each tree usually has its own particular species of fungus. Some fungi are edible, others poisonous, others woody. Many of the forms are shelf-like growths which project from the tree within ten feet of the ground.

The fungi are not confined to damp regions; they are, as a class, independent of climatic conditions. Sometimes one may find square miles without any fungus; again, in a single square mile one may find fifty kinds. The sturdy oak of poetry is peculiarly liable to attack, especially by two bracket types, *Pyropolyporus ignarius* and *P. Everhartii*. The following description of the latter species is given. On the edge of a swamp was a huge oak stub some 50 feet high. Commencing at the base, the big brackets stood out, curving in spiral form to the top. On the ground were the rotted remains of many more. Estimating the age of the fungus by its layers, it was seen that twelve years had been required to kill the oak.

After other descriptions of the havoc wrought on other trees by other parasites, the writer concludes:

After due consideration, one is tempted to conclude that all plant and tree life was originally created solely as food for the fungi.

In ancient Aryan teachings, the Universal Life is distinguished into three prime functions, which, translated into modern abstract language, are Creation, Preservation, and Destruction—the latter better called Regeneration, since life is a circle and death but another name for rebirth. The ancient Aryans, however, not believing in the reality of abstractions, regarded the Universal Life as an intelligent and conscious Being and Beings, assigning the names Brahmā, Vishnu, and S'iva. It is with the last aspect that we are immediately concerned.

When a being has completed its life-cycle,

the life-force loses its integrity, falls apart, and passes on to other forms. This process is called decay, and is perfectly natural. It is conducted by living beings. Science recognizes that fermentation and putrefaction are accomplished by living beings, for it has caught the actual creatures under its microscope; and though it does not call them S'iva, it has not been behindhand in the matter of finding other names for them. And as days go by, science discovers life in more and more of the processes previously supposed to be dead and mechanical, so that soon it will recognize that every process in nature is accomplished by the action of living beings of some kind or other.

But the mischief comes in when a process that is natural and beneficial within its normal limits gains an undue ascendancy; and often we find the processes of decay gaining ground on those of creation and preservation and threatening the living with untimely death. Thus diseases attack men and animals, killing them before their time. And this is what seems to have happened in the case of these trees with their parasites. A natural process for removing used-up forms of life, and for passing along the life-current to new forms in its eternal circle, has overstepped its limits and become a disease that ruins living forests. It has acquired a virulence that gives it a power over what does not belong to it, as when Death steps out from his hovering among the tombs, and stalks, scythe in hand, through the land of the living.

Now what is a tree? We may trace the oak back to the acorn from which the entire tree has so mysteriously unfolded; we may trace the acorn back to the microscopic nucleus and to the point within the nucleus; and the whole process is summed up in the statement that the vast physical form has flowed out into our world from a *point*. That point is the apex of the pyramid of scientific knowledge; to it all the lines converge, and at it they disappear. Beyond that point again diverge lines and magnitudes invisible to science, stretching into the infinite space of the immaterial and ultra-physical. The point in the cell is the door at which life enters the physical world. So all we know of the tree is its physical manifestation. What the tree is in itself we know not. Nevertheless the real tree is no more the physical form than man is his body. In itself it is a "living soul." It affords us beauty and shade and material for building; but, like the flower that "blushes unseen," it has in the universe a place that is entirely unconnected with such utilities.

And this beautiful life is sapped and destroyed by another form of life that bears the stigmata of ugliness and banefulness and uselessness. What is the fungus? Again we must say it is a mysterious life flowing into the physical world from an invisible source under the impulse of invisible life-forces.

In real Science there are no abstractions

and every living being is recognized as primarily a Soul. The vegetable kingdom is ensouled, though not with such Souls as inform the higher kingdoms. Still there are vegetable souls with an order of consciousness peculiar to themselves. The fungus is a parasitic vegetable soul. Whence come the souls that animate the vegetable kingdom?

Now real Science teaches that the chain of life is continuous and that higher forms pass on their life to lower ones, the higher acting as creators to those that come next in the scale. Thus man is a creator of lower forms of life; for the life-atoms that he has used and cast off pass out into the ether of space to be re-absorbed by lower forms of life. In this way, then, the lower kingdoms get their inspiration.

Now, if the life-atoms which man sheds with every breath should be charged and stamped with disease, what would be the effect on the lower kingdoms which absorb those diseased atoms? If man, by his thoughts and deeds, were chiefly engaged in creating funguses, would there not be likely to be a superfluity of fungi in the vegetable world?

And this is precisely what does happen; by this are explained the plant diseases that dog man's footsteps and attack his vines and fruit trees as they might attack his children. Man positively *poisons* nature. Ordinary science recognizes how he poisons the air, the water, and the soil; it is but a step along the new channels of research which science is opening up, before we recognize that man also poisons the ether, the electrons, the ultra-violet rays, etc. He poisons the ether of thought, stocking it with the half-conscious creatures spawned by his imagination, and so well known and feared by the ancients as devils, elementals, spirits, and so forth.

So, though we may devise any number of physical means to stem the fungus evil, we shall never get at the source until we recognize that source.

Nature is far vaster than man (man the creature, not Man the God); but she is yielding and plastic and succumbs to his attacks much as the skin might succumb to the attacks of an insect. The surface of nature is altered by these attacks, and from time to time she relieves herself and there is a cataclysm. Man is himself to a very large extent a parasitic growth upon nature.

The mental life of man is covered with parasitic funguses, which are the various besetting sins, the emotions and passions that sap the pure life of the soul. Physically he is full of parasitic life which is ever ready to burst forth into virulent disease and has to be continually kept down by medicine. So the example which man sets to the creatures below him in the scale, the atoms which he passes on to them are of the kinds the results show.

We may talk learnedly of the necessity for keeping science and metaphysics apart, but there is no such necessity; there is a strong

necessity the other way. We may try to make an artificial category of the "practical" as opposed to the "speculative." But we are fools for our pains. The truly practical man is he who studies life *as it is*, not as he thinks it ought to be. And we find that as an actual fact, life is not so marked off into departments. However much we may try to confine our life within certain defined limits, which we choose to call natural and normal, the abnormal and the unexpected have a way of intruding. So we shall be forced to recognize the *very practical truth* that we can never have knowledge of nature as she is, until we study her as she is. And, as all the departments of nature are blended and interdependent, true Science must concern itself with the whole.

The question of plant hygiene, therefore, becomes an integral part of the whole question of man's life, considered in the light of Duty and Right as well as of the highest self-interest. If we would have healthy plants we must be as careful what we do with our waste thoughts as we are about the refuse from our chemical works, or we shall infallibly poison them all.

### The Yellow Journal's Latest

THE lecture, which was on "The Evolution of the Sentiment of Compassion," was delivered by the Rev. Dr. Bloodgust, now in the enjoyment of his fourth body. The venerable savant's neck . . . (From a newspaper of 1980).

But before going further we must explain.

A professor of ——— University, presumably during an attack of muttering delirium, recently flowed out into the remark that surgery had now advanced to such a point that it was possible to cut off the heads of two human beings and sew each to the other's neck.

Fired with noble zeal, an American surgeon accordingly *did* cut off the heads of two dogs and sewed one of them to the neck of the other. He reports that this other lived twenty minutes and that the head showed that nervous communication with the body had been established!

This account inflames the imagination of a fairly well-known professor, who breaks out in the Sunday issue of one of the yellowest of our yellow journals into a glowing sketch of the glorious possibilities thus opened up. Think of the bodies of so many young criminals electrocuted and then let go to waste! Why not behead them and then place them at the service of some old head bowed with years and thought and honor? (!) This old head could hold itself up once more; the worn-out old brain could renew itself and go on thinking those sublime and tender thoughts of which death now threatens to cut the stream!

Suppose that Newton's brain, undiminished in essential power, had been clapped upon the vigorous body of some criminal executed at Tyburn, when the failing bodily powers of the discoverer of gravitation were dimming the sight of his marvelous intelligence.

Our own imagination now takes fire. Why wait for the criminal? Why should not each city, desirous to do honor to its wisest, select the *best* from its own youth and behead them? Nay more: why should not a city whose funds have run low do the same for *any* old man who will pay well and who wants his youth and virility restored for another squandering?

A whole double page of the journal is oc-

cupied with this vile stuff, illustrated with pictures of the decapitated dogs, their heads, the butchers in the act of operating; and of a repulsive female figure, an aged and year-worn face upon a youthful body.

The page will possibly have a million readers. How many of that million, with these pictures and ideas throbbing in their diseased imagination, may in some attack of mania attempt to put it all into practice? And then the same journal would give another illustrated page to an account of their crime!

Turning the sheet over, we find a denunciation of gossip, by a reverend gentleman. The denunciation is all very well, but in the course of it he tells the story of a man who, driven mad by gossiped insinuations against his wife, cuts her throat. A repulsively realistic picture of the throat-cutting accompanies the text.

Of such is the kingdom of—the yellow journal. And we permit it, let it go through the post, let it copyright itself, let children and young men and maidens read it. And we are all the time the most progressive, the noblest, the most patriotic nation on earth, in the very forefront of time!

### Old Bible Good Enough for Presbyterians

AT a Presbyterian assembly, a motion to adopt the American Revised Version of the Bible was laid on the table by a vote of 217 to 211. One speaker is reported to have said:

We're getting too many Bibles. There's the St. James version, the original version, the American version, and the one that the Baptists wish the country to adopt. The old Bible's good enough for us.

Assuming that he meant the *King James* version, what could he have meant by the "original version"? There were several before the King James revisers adopted their version. And what did he mean by the "old Bible"? Clearly he could only have meant the King James version.

If this man had lived before the James version, he would have said the Wickliffe Bible was good enough for him. If he should live again in the future, he may say the American Revision is good enough for him. If people want what they are used to, all well and good, and the less cant about it the better; but let it be understood it is not the truth they want.

But, if instead of wanting the Scriptures in the form which we are used to, we profess to want them in the purest possible form, what are we to do? The American Revision, the work of a large body of the best American and British churchmen and scholars, revealed some terrible errors in the older version. For instance, in the last chapter of Mark we read in the old version:

And he said unto them, Go ye into all the world and preach the Gospel to every creature. He that believeth and is baptized shall be saved; but he that believeth not shall be damned.

But in the margin of the Revised Version:

The two oldest Greek manuscripts, and some other authorities, omit from verse 9 to the end. Some other authorities have a different ending to the Gospel.

And in *Matthew* xxiv the old version reads:

Tell us when shall these things be? and what shall be the sign of thy coming, and of the end of the world?

And in the Revised Version this reads:

The sign of thy presence and of the consummation of the age.

If, to escape the doctrinal glosses of translators, we go back to the Greek, we are confronted with a multitude of Greek MSS, disagreeing on important points. Nor can satisfactory authority be found for any single one of these versions, which were drawn up, nobody knows by whom or how, in the early centuries of the Christian era amid a Church divided into bitterly hostile sects.

One way of grappling with this difficulty is to assert that a Church has power to decide such questions and is the final court of appeal thereupon. Another is to allow (theoretically at any rate) latitude for individual interpretations. But neither church nor Bible are infallible. In all Bibles there are certain truths which can be recognized as such by their appeal to the innate sense of right and by their helpfulness in life. Also there are dogmas which have as evidently originated in human perverseness. Those, then, who are seeking the truth, and who do not merely wish to perpetuate their prejudices, must extend the field of their investigations and take into account not only the Christian Bibles, but the Bibles of other faiths; and they may be able to extract from the combined wisdom of the ages a doctrine more in accordance with intuition and reason than those built on English translations of Greek adaptations of Hebrew-Syrian-Greek-Roman religion.

STUDENT

### The Immaculate Conception

IN CENTURY PATH No. 26, vol. XI, appeared a paragraph headed "Three Generations of Deity," and comment was made on the fact that Bishop Rumeau, in a sermon recently preached at Lourdes, referred to the Virgin as "the daughter of the Father, the mother of the Son, and the bride of the Holy Ghost."

It is perhaps not generally realized that the dogma of the Immaculate Conception of Mary really involves what may be called a third generation of Deity, since it requires the assumption that the conception and birth of the Virgin represented a special exercise of the Divine Will, or, in other words, that she was the daughter of God. From this proposition arise the extraordinary complicated degrees of kinship in which, according to the Roman church of today, Mary stands with the three Persons of the Trinity. Surely, in the dogma of the Trinity itself we already had sufficiently abstruse metaphysics, without this further attempt to make "confusion worse confounded"!

The doctrine of the Immaculate Conception of Mary was propounded in 1306 by the famous schoolman John Scot of Dunse, who at one time occupied the chair of divinity at the University of Paris. He proposed it not as a deduction from anything in the Bible or Apocrypha, but actually as a subtle speculation upon what God might have done. Opposition to this doctrine was forbidden by decree of pope Paul V, confirmed by those of Gregory XV and Alexander VII. In 1854, pope Pius IX promulgated a bull declaring it an article of faith that Mary was conceived and born immaculate, or without original sin: those who should doubt or speak against it were banned as heretics.

## Art Music Literature and the Drama

### The Musical Life at Point Loma

[The following is published at the request of a number of students who heard it read some time ago at a student-meeting by Mrs. Julia Peck, then Miss Hecht. It may not be out of place to state that Mrs. Peck has been associated with the children's musical work at Point Loma from its inception and that her observations, therefore, are based upon eight years of experience. That her work has been both scholarly and sympathetic, results plainly show.

STUDENT]

KATHERINE TINGLEY has said: "Music is the basis of life. It is the harmony of life; and if we attune ourselves physically, mentally, and spiritually, we have the key that unlocks the door of the mysteries of life."

Comrades, do we realize that life in Lomaland is our present opportunity to learn music in this deeper sense? For not only the musicians, but all the students here, are sharers in the musical life of Point Loma. Even those who believe themselves to be unmusical may be, in their silent way, adding to the harmony of it. For, just as the rests and pauses in music are a part of its rhythm, so there might be a time in the life of the soul when harmony of development demands a silence, as far as outward musical expression is concerned. But during these intervals of silence, there may be a gradual harmonizing of ideal and practice; a silent, devoted preparation for the blossoming of a higher musical faculty in later lives.

In order to have our lives the grand symphony which it is our dream to make them, we must be brought to a point where we will make them ring true *together*, and we who have been with this Master Musician, our Teacher, so long, know that high, very high, moral achievement is necessary to make the nature ring true. It is comparatively a superficial achievement to master the technique of an instrument sufficiently to produce a musical expression that gives more or less pleasure, and that may even create the impression that there exists the power to make a great stir in the world; but what the students at Point Loma are trying to do is to attune their whole natures to a higher expression of harmony in life than has ever been known before, and our life together here is, in a sense, like a combined effort at "tuning up." It might be compared to the "tuning up" of the instruments of an orchestra. All the evil tendencies to which we have given free scope in the past, all the limitations which we have placed upon ourselves in former careers, all these have to be dealt with — have to be attuned to the ideals of this ideal life; and all the wrong technique of human living must be righted before the soul can be free to express fully its divine harmony.

The Master Musician is at work. What is our attitude as pupils? Are we willing to be tuned — attuned? Our Teacher does not experiment. She gives us the opportunity to vibrate in unison with the divine concord of the universe; and we will not understand Life's Song until we respond to her efforts

in as impersonal a way as if we were the strings of an instrument. If we are not in tune how much better it is to be silent than to produce tones which are discordant!

Pythagoras was a master of music and numbers, as well as a great teacher, and he was wise enough to teach his pupils the power of silence. But during this necessary pause of silence, if we listen with extreme care we may be able to hear the music which is in all things, and to catch the vibrations which are in sympathy with the Higher Law.

We now have the choice, if we never did before, of being dumb — striking no notes — or discordant, or ready for the process of tuning up. If we are willing to be harmonized with all we can vibrate in unison with the deepest and richest chords of life's harmony; but not otherwise. This is the opportunity in the musical life at Point Loma. Do we realize how great it is, and how deep is its basis?

It is useless for the mind alone to try to formulate the musical life or the opportunities for soul-growth that are being unfolded at Point Loma. The terms of any "method" known to musicians in the world will not express the musical development that is here in progress among us.

In the world there are "specialties," and also musical cliques which are built on selfishness and which ignore the higher needs of the soul-life. They too often hold that man is made for music, instead of music being made for man's higher uses.

Music, as a profession in the world, stands pre-eminent as the one which breeds the greatest amount of jealousy among its followers. "Professional jealousy" is a stock phrase for the differences which so commonly arise among musicians. Such a condition has never existed here, for it is the result of personal ambition, and of course the earnest student of Theosophy soon puts that out of his account. Even though our personalities rub against each other today, no resentment is cherished and tomorrow the Work — the Cause — throws us together in a way which demands co-operation. The true comradeship does exist here although we may as yet fall short of realizing the possible glorious outcome of a perfect musical life.

Beethoven has said:

From my childhood, whenever my art could be serviceable to poor suffering humanity, I never required anything beyond the heartfelt gratitude that it has always caused me.

If the unselfish efforts of one musician like Beethoven could do so much to touch the hearts of men, how much more can be accomplished by the efforts of a united body of musical workers, all purposes vibrating in unison, under the guidance of one Master Musician? Surely we can strike a new note in the world and affect a whole universe on those planes where the sensibilities are so keen, but as yet so unrecognized. Some of us know that there are many in the world who are awakening to this beneficent influence of music, and whose needs the harmony of our lives

does reach, potent to satisfy and to answer.

I feel that every musician here will bear me out when I assert that the greater possibilities of our musical life here are due to our efforts towards a thorough discipline of the whole nature. Before music itself can change, musicians must change, and here we have the wise guidance of One who leads us safely along middle lines in adjusting ourselves to life's deeper harmonies. Let us trust that deeper tone that is even now audible in our musical life here. We are assured that this undertone can already be heard by those who, coming from the world, find here a new note. Has it occurred to you that in the rhythmical flow of perfectly regulated lives, the accentuation of all that is highest and truest in our natures recurs with a frequency that should hold us steadfast to the nobility of our calling?

Of the music of Point Loma it is difficult to speak, for it is itself such a definite expression. It here seems apropos to quote Schumann, who said that "The best discourse on music is silence."

Although some effort has been made even in the darkest times to preserve music, yet never before has the daily life of the little ones been so permeated with music as in the Râja Yoga School. This effort, in which our beloved comrade, Mr. Neresheimer, was Point Loma's pioneer, will ensure a musical inheritance for the race, were there none other.

In this connexion it is most fitting to speak of this comrade who stepped into the place that was waiting to be filled and, under Katherine Tingley's guidance, laid the foundation of the children's marvelous musical work. It would be difficult, if not impossible, to say too much of the devotion, perseverance, and painstaking work of this comrade; a devotion which knows no change, and was ever watchful for guidance from our Leader, no matter what outer circumstances might be. To give an extract from a letter which I received from him last week in connexion with Point Loma musical matters:

I am thinking of you and the comrades very frequently, and experience much longing to be with you as of old. However, my duties will confine me to this section of the country for yet awhile. Much to my regret there is no opportunity for music where I am at present, and I miss it very much. There is not even the least incentive, and perhaps not even time enough to practise music by myself. This, as you must acknowledge, is a great drawback and disadvantage to a life away from Point Loma. I know the sincere love for music of all the students at Point Loma, and the consequent devotion to the art, which makes a rare and choice atmosphere for the musician. I am constantly thinking of how to arrange my affairs so that I may return, the sooner the better.

With kind regards to yourself and all the comrades, I remain,

Yours sincerely,

E. A. Neresheimer.

Surely if a comrade at a distance, deprived of the opportunity of life here for a time, can feel such devotion, what should be our attitude, since so great are our opportunities!

The women of the world are not yet beginning to suspect their divine power to aid suffering humanity. They have been for ages asleep.—Katherine Tingley

### The Temperance Cause

IT must be said to the credit of women that they have fought the liquor evil valiantly and persistently. At last something certainly has succeeded in arousing the public conscience to an extent. It is a curious study to observe the sophistry that has been used to perpetuate this evil. No one thing, perhaps, has done so much harm that has come within the bounds of legislation. More insanity, crime, poverty, wretchedness, cruelty, utter misery and degradation has been due to this than to any other one thing. The man who indulges in this vice not only makes of himself one of the most disgusting, loathsome objects that can be imagined, but he changes his home into a hell and stamps a curse on all his offspring.

And yet there are otherwise well-meaning and respectable people who regard it lightly; who sometimes even smile at the sight of a poor victim, as if his vice were an amusing weakness. It is astonishing and would be unbelievable, if alas! it were not too true. And everything has been made easy for these poor wrecks to go to perdition, saloons everywhere and everywhere enticements.

Year by year thousands and thousands have been allowed to fall, disgracing the nation. And the respectable people, those who have had the power to check the evil, have stood by and said that nothing could be done. They have even legalized it. And the government has given its protection to those dealers who would pay it money. All this because it would not be right to restrict a person's liberty to buy what he might please. It is right to forbid a man to prune his trees on Sunday; it is also right to make a law against suicide (when it is done quickly), it is right—under the law—to hang a man, even, but as for interfering with his liberty to get drunk—that is quite another matter!

However, there is a general awakening at last, though one would not have imagined that

the women who have worked for temperance and the home could have had such difficulty in getting a hearing. Only now, as there seems to be some real danger that the crime may be lessened, some people of unusually tender consciences have bethought themselves of the poor and of all those who will be thrown out of work in case the liquor traffic should cease!!!

Why is it, that that which would be so evident to the moral sense of an individual, of even a normal child, seems so to confuse the moral sense of the public? STUDENT

TRY slowly to make it your motive for fidelity that others may be faithful. Not for thousands of years have the opposing forces been so accentuated. Not one of you can remain neutral . . . The cry has gone out to each and each must choose. This is your opportunity.

—Katherine Tingley

### The Universal Insanity

ALMOST everyone would indignantly resent the accusation of insanity, and yet there is certainly one point in which every one at the present stage of evolution is insane. Everyone has an overweening idea of the importance of his own personality. Of course this statement will be denied at first sight. For is the world not full of those who suffer from lack of confidence, from over modesty; whose lives are one long sacrifice, whose thoughts seem only for others? Some, indeed, are nearer the sane point than others, and possibly a few have almost reached it, but for the most part the various forms of self-depreciation are but the other side of the same difficulty. The pendulum of self-consciousness has simply swung in the other direction; it has not found the balancing-point. To find it would mean to be selfless, and such a one would be quite different from those we see about us everywhere and every day.

All the great Teachers have recognized this, and made it the pivotal point of their teachings. They have taught always the necessity of an equal regard for others. But so far from understanding the deep meaning in these words, most of the world has considered them chimerical, impractical, sentimental and impossible of being lived up to, whereas, in reality, they are a part of the technique of evolution, so to speak, as necessary to the growth of the inner man as rain and sunshine are to the growth of a tree. A fuller exposition of nature's laws has been given to the world within the last quarter century than ever before. To quote from *The Secret Doctrine* in regard to the Wisdom-Religion—the synthesis of all religions:

The central point from which all emerges, around and toward which all gravitates, and upon which is hung all its philosophy, is the One Homogeneous Divine Substance Principle, the One Radical Cause. . . . It is latent in every atom in the Universe, and is the Universe itself. (Italics mine.)

It then is man and all men, and the inherent importance of one over all the rest does not exist, it is *not a fact in nature*, and therefore a belief in this is insanity. Some contain more of *It* than others, have greater responsibilities and serve larger ends, indeed, it is said that no two are at exactly the same stage of evolution. But all are *It* potentially. Yet in spite of these facts, there lurks in the heart of each a subtle idea which it is impossible to put into words of the importance of the personal *I*. As quick as a flash, and almost unconsciously, everything is referred to this *I*. In the case of those who are shy there is the thought, "*I* am criticised; *I* am inferior; *I* am not liked," and so on. In the timid, every circumstance calls forth the idea, "*I* am not equal to this, or *I* should fail if *I* tried that." Those who are vain or ambitious feel pain whenever they are superseded.

The insanity is plain when the pendulum swings on the side of self-conceit. But the

over-modest, are they free? And those who are working for others—leave out of account the long list whose vanity only can be satisfied by their being virtuous; of those who are working for sentiment; of those who are trying to earn the love of others—those that remain will no doubt be found to be tainted with the disease. Other events and circumstances will quickly awaken the thought of *I* as separate, and different, and more important than the other *I*'s. And yet each one who labors under this delusion can look into the eyes of every other fellow-passenger he meets and know that he entertains the same delusion regarding his own *I*. No matter how low down in the scale of evolution he may be, nor how high, a Master of Wisdom no doubt would be able to find in his nature some of the poison of self.

Ah! to become impersonal! What does it mean? It is the task of the ages. And how can anything be seen aright, with a subtle untruth running through every cell, through every etherical essence, woven in as a part of every thought, however great and true it may be in other respects? No wonder that Jesus said that to love one another was the whole law and the gospel. STUDENT

### The Women of Egypt

**S**MALL relationship do the Egyptian women represented in the illustration on this page suggest with the glorious women of Egypt when that land was in the light: Mertitips, the wife of Seneferu; Queen Menkara, better known as Nitocris; Queen Aah-hotep the mother of Aahmes; Queen Hatshepsitu; that wonderful triad of Queens who worked together so harmoniously for the welfare of their people, Mutemva, mother of Amenhotep III, Tiy, his wife and mother of their son Khenuat, and the latter's gifted, good and beautiful wife, Nefert-i-Tain.

Then there was strong Queen Batria, the wife of Rameses III, of whom history might very reasonably say a good deal more, and 'scores of noble Priestesses in the ancient Temples, whose names are not known to us but whose influence, as exponents of the ancient Mystery-religion, must have been far-reaching, well-nigh incalculable.

Nothing that hints of the moral and intellectual sublimity of Egypt's pure types of Priestesses and Queens can be seen in the faces of the modern Egyptian women of the Fellah class, for they are not themselves descended from the pure stock of old Egypt but are of another race. This was pointed out by H. P. Blavatsky, the first of modern writers to give the key to a right interpretation of Egyptian history and the researches of modern

archaeologists among the ruins of old Nile.

An account of the discovery by an American archaeologist of the tomb of Queen Tiy has already been given space in these pages. To those who look at history in that larger view which sees progress to be ever cyclic, every archaeological discovery by Americans holds a special and even sacred interest. Who the old Egyptians really were, what constitutes their relationship, or rather, non-relationship with

the race at present occupying Egypt, and who and what the ancient Egyptians are today, are subjects treated at various times by the Three Leaders of the Theosophical Movement, and the conclusions stated in their various writings are well known to all Students.

Twice, during her journeys around the world has Katherine Tingley stood within the shadow of the Great Pyramid, even within its innermost recesses, twice has she walked the ruined halls of Karnak, of Luxor and of Thebes. She has visited Philae, sacred to Hathor, now in ruins, seemingly deserted by all save—mark this, students of symbology—tiny clusters of bees. Twice in the mystic atmosphere of that sacred past which hangs over modern Egypt as hangs the night-mist at sunrise over a mountain lake, has she prophesied that Egypt's ancient glory would return, that the ancient fires would again be lighted, and that the Queens and Priestesses, the mighty Kings and Initiate-Teachers, the dominant people of that past and vanished age, would come again. When? Those who know the mysteries of the Law and the Cycles of Time alone can tell. STUDENT

### From a Woman's Expense Account of the Year 1851

**A** WOMAN writer in the *Brooklyn Eagle* has the following to say regarding a memorandum book, dated 1851, which has just come to light in a New England village and which contains some items that can scarcely fail to interest the woman of today. H. H.

The woman who kept this account book paid, to be sure, \$3.25 to go from Westfield, Mass., to New York, and \$3 more to go from New York to Philadelphia, but she paid only twenty-eight cents a dozen for her washing—beautifully ironed and brought to her door—and \$10 a month for her board, and says that it was good, too.

She had her daguerreotype taken, a single picture, and paid \$1.50 for it. She bought a pair of shoes for \$1.25, and had a dress cut for 37½ cents. The accounts bristle with half and quarter cents. Things cost sometimes a "fip," sometimes a "levy." The former was 6¼ cents, the latter 12½ cents.

She bought a pair of rubbers for 87½ cents, and wrote them down as "gums." For her pew rent at church she paid 66⅓ cents a quarter. Her gowns were made of "debage," "delaine," and "mull," and she paid \$1.75 for the fitting and making of one. She wore congress gaiters, and paid the exorbitant price of \$2.25 for a pair. She bought a copy of *Agnes; the Key to Her Coffin*, a book which many of us remember to have seen lying on parlor tables even in the '70's. It was considered a wonderful work in its time, and most comforting to those in affliction. For teaching school eleven weeks this woman received \$82. She has a tooth drawn and pays 25 cents ... this before the days of anaesthetics.

Lomaland Photo. and Engraving Dept.

### EGYPTIAN FELLAH WOMEN WITH THEIR WATER-JARS

... And yet there are records which show Egyptian priests—Initiates—journeying in a North-Westerly direction, *by land, via what became later the Straits of Gibraltar*; turning North and traveling through the future Phoenician settlements of Southern Gaul; then still further north, until, reaching Carnac (Morbihan) they turned to the West again and arrived, *still traveling by land*, on the North-Western promontory of the New Continent (or on what are now the British Isles which were not yet detached from the main continent in those days).

What was the object of their long journey? And how far back must we place the date of such visits?—*Helena Petrovna Blavatsky*

(In *The Secret Doctrine*, vol. II, p. 750)

# OUR YOUNG FOLK

## A German Bard and Hero

WHEN Friedrich Schiller, the most beloved German poet, was young, poor, and in exile, he lived in the room shown in our illustration. We could wish that the picture were a better one, for it was not happily taken, but despite its imperfections we present it because of the bright memories which cling to it, memories which make the room one of the hallowed spots in Germany.

Friedrich Schiller was a great national hero, although he never wielded a sword. With his pen he became the champion of his oppressed countrymen, and suffered in their cause. The very mention of his name brings the glow of enthusiasm to the hearts of all Germans. It has the same magic as the name of the great imperial champion of the people, Friedrich Barbarossa. Both these great Friedrichs were cradled among the beautiful verdant hills of Swabia, and both were imbued with that superb courage that gave to the Swabian people of old the privilege of bearing the banner of the Empire in the van of the imperial army. Both these Swabian heroes, with the Celtic name of Friedrich, were men of genius and men of heart. They loved mankind greatly; they felt the sorrows of others more keenly than their own; and they devoted their splendid powers to the cause of freedom.

Schiller was born in 1759, at a most critical period in the history of Germany. The great German Empire welded together by the power and genius of Barbarossa from the remains of the mighty empire of Charlemagne had disintegrated, and a loose federation of petty princedoms and dukedoms, without a central governing power, was all that was left to bear the once proud name of Germany. As a result of the disruption, and the jealousy which existed among the different states, foreign powers from time to time seized portions of German territory and there was no organized force to resist them. Germans fell more and more under foreign influence. They aped the follies and frivolities of foreign countries. They were ashamed of the simplicity and morality which had been their inheritance from prehistoric times; and, deepest disgrace, they were ashamed to speak the noble German language. The courtly French was spoken by all educated people and in the universities the lectures were delivered in Latin. In consequence, the fires of patriotism burned low, for there is a deep inner tie between love of fatherland and the speaking of the mother tongue. Because there was no great central power to which the people might appeal it was possible for each petty prince or duke to become a despot in his own country and oppress the people.

All these sad conditions which existed in the fatherland, and above all the oppressed condition of the people, made a deep impression upon the youthful heart of Schiller.

ROOM IN LEIPZIG IN WHICH SCHILLER WROTE HIS  
"HYMN TO JOY" IN 1785

## RIDDLE

(The Rainbow)

Johann Christoph Friedrich Schiller

FROM pearls her lofty bridge she weaves,  
A gray sea arching proudly over;  
A moment's toil the work achieves,  
And on the height behold her hover!

Beneath that arch securely go  
The tallest barks that ride the seas;  
No burthen e'er the bridge may know,  
And as thou seek'st to near—it flees!

First with the floods it came, to fade  
As rolled the waters from the land;  
Say where that wondrous arch is made,  
And whose the artist's plastic hand?

Indeed, he too, had been a victim of the general tyranny. He, with other of the brightest boys of Württemberg, was forced to leave the school he was attending and to enter a military academy founded by the Duke of Württemberg. This academy was almost a military prison where the boys were shut off from all wholesome knowledge of men and were subject to the will of the reigning duke. When Schiller was seventeen years old, the American colonies declared their independence. It was done across three thousand miles of ocean, but the effects of the potent deed were felt all over Europe. The new spirit of freedom that was awakened, like a good fairy in disguise, entered the gray walls of the military school and touched the hearts of the young students there. They became aware of the value of their lives, and at once the sympathetic, loving heart of Schiller began to stir with a larger indignation at the injustice under which not only he and his comrades but his country and all mankind suffered. This generous, ardent, manly indignation took dramatic form, for this was the bent of Schiller's genius, and the last two years that he was at school, he secretly wrote his first tragedy, *The Robbers*. In this drama, the robber chief Karl Mohr and his companion robber-knights, appear not as robbers, but as a band of free, independent spirits who, because they were outlaws, could champion the cause of those oppressed by the

law and redress their wrongs. It was the hero-spirit in Schiller himself and in his young companions that found expression in this play.

*The Robbers* was first presented two years after Schiller left school. The hero-spirit that had burned in his heart as a schoolboy aroused the sleeping hero-spirit in all those who witnessed it. The tragedy won instant success, for it spoke straight to the hearts of people. It was not long, however, before the play was reported to the duke as "dangerous," and Schiller was obliged to fly in secret from Württemberg or give up writing plays.

During his exile Schiller began the study of history, which gave him the insight into human nature denied him by his training. And it was through historical dramas that he voiced the noble sentiments of liberty, justice, and patriotism that burned in his heart. He spoke straight to the hearts of his countrymen at a time when they needed such a voice, and aroused them to a sense of duty and self-respect. His own simplicity, morality, and truth were as eloquent as his poetry. In the hearts of the youth of Germany he sowed the seeds of a nobler manhood and womanhood; and in the hearts of the young he is enshrined for all time as great bard and great patriot of the German Fatherland.

UNCLE OSWALD

## Brotherhood in Intercollegiate Athletics

AN encouraging sign of the dawn of a new era is to be found in the stand taken by the captain of this year's Harvard crew. This captain stated openly, in the face of ridicule from some of his fellow-students, that the aim of his season's work was not to win in the race with Yale, not to merit popular approval, but to develop a body of men working in true unity, and to offer an example to minor crews of physical exercise with a high ideal in view.

As a result the training of the season was without petty bickerings about mine and thine, without sense of drudgery, without internal dissension. The adjustment of swing between oar and oar, necessary for the harmonious co-operation of the oarsmen, was attained to rare perfection. The subsequent races with other crews gave ample proof of the added dignity, freedom, and power contributed by this one crew to the atmosphere of the American avocation, college athletics.

## THINGS USED AND REGARDED AS SACRED BY THE AMERICAN INDIANS

### A Monument to a Heroic Dog

EARLY in the morning on May 15th last, the neighbors of a family in Grand View, New Jersey, were awakened by the barking of a dog. The bark was so shrill and was continued so long that they went to the windows to see what was the matter. There was a little dog evidently trying to make someone hear. One of the neighbors went out and soon saw why the dog was giving the alarm. A house near by was on fire, and the people in it were sound asleep! Other neighbors came running up and they all shouted and knocked on doors and windows but could wake no one. Something more had to be done, that was certain, but no one felt like entering the burning house.

Suddenly the little dog who had been running about, frantic with grief, jumped right through one of the front windows. In a moment or two out came a man with his feet severely burned, and the dog with him. But there were others to save and the dog went back and roused the man's wife, who got out safely.

The heroic dog then dashed through another window where the fire was blazing. When he came out, all singed, he had the family cat with him almost dead with the smoke.

Once more the little hero plunged into the fire. The crowd tried to hold him back but he was too quick for them. What he went to save is not known, for he never came out! The house was burned to the ground and the brave little animal with it. The neighbors tenderly searched the ruins for what was left of his body and buried it down beside the Hudson River in the grounds of the chapel, heaping the grave with flowers. Then they arranged to mark the grave with a monument on which the story of the dog's bravery is to be written.

Honor and praise to this heroic little dog! The story of his bravery and self-sacrifice, his loving faithfulness to his friends should make every heart more tender towards animals.

He alone among all who had gathered at the fire after he had given the alarm, was ready and able to do the thing that was to save the lives of those he loved. And he was called "just a common little dog." G. M. T.

### From "HIAWATHA"

H. W. Longfellow

AT the door on summer evenings  
Sat the little Hiawatha;  
Heard the whispering of the pine-trees,  
Heard the lapping of the water,  
Sounds of music, words of wonder;  
"Minne-wawa" said the pine-trees,  
"Mudway-aushka!" said the water.  
Saw the fire-fly, Wah-wah-taysee,  
Flitting through the dusk of evening,  
With the twinkle of its candle  
Lighting up the brakes and bushes,  
And he sang the song of children,  
Sang the songs Nokomis taught him;  
"Wah-wah-taysee, little fire-fly,  
Little, flitting, white-fire insect,  
Little, dancing, white-fire creature,  
Light me with your little candle,  
Ere upon my bed I lay me,  
Ere in sleep I close my eyelids."

### Among the Redskins

IN the picture you see the tepee, the canoe, the water-jar, the bow and arrow, the calumet or pipe, the cradle-board, the war-bonnet, and the wampum used by the American Indians. The sun and moon and stars, the lightning, clouds, and rain, the eagle, and the dome of the sky are just as much a part of their daily life as their homes and weapons; for the redskins revere Nature and turn their thoughts toward the sky very often with love and trust.

These Indians, in their natural state, live in tepees, or tents, made of the hide of the buffalo, or in hogans, which are huts made of earth on a framework of poles. The tepee is often ornamented with symbols. You may see painted on it the eagle, the rainbow, the moon, or the stars. Every part of the home has a special meaning to the Indian; the very poles represent something that reminds him of the beautiful works of Nature. The place of honor for guests is opposite the door. It is round the hearth in the evenings that the Indian children hear stories of great hunters and warriors and learn the secrets of war and of the chase.

Perhaps you have read how Hiawatha made his canoe; taking the bark of the birch tree, the boughs of the cedar-tree to make the frame for it, the roots of the larch-tree to

fasten the ends together, the gum of the fir-tree to fasten down the seams; and then with the love of beauty that is in every Indian lad gathering the quills of the hedgehog, staining them red, blue, and yellow, and adorning his canoe with a necklace.

The cradle-board to which the Indian baby is strapped is very carefully prepared. There is a ceremony when the wood for it is cut from the tree, and then it is decorated with symbols. The very best cover is believed to be the skin of the speckled wildcat because it looks like the sky sprinkled with stars; and the hoop often seen at the top of the board is to represent the arch of the sky. The baby is strapped to the board with strips of otter skin, supposed to have a certain virtue.

In early times certain bows made of box-wood were looked upon as especially sacred by some tribes who believed them to be a gift of the Great Spirit, sent to help the people to defend themselves. They were always guarded by young warriors chosen for the purpose, and they were never handled by anyone else. They were never left upon the ground, but always hung carefully on a tree. The Indians used to tip their arrows with flint with which they also made fire and they compared these arrows to the lightning in the sky.

The eagle is the bird most revered by the redskins. You can see how they love the sky by the way they picture it in so many places and it is easy to see also that the eagle who soars so high and seems to touch the sky, is sacred to them. The eagle's feathers are the reward of brave acts. Every one in the head-dress of an Indian is a record of a courageous act.

No people love song more than the Indians. They have songs for work, songs for games, songs for making the corn grow, songs for healing, and other religious chants. They believe that singing will keep away evil. They are very careful to sing every word as they believe the song's power to do good is lost if they forget any part of it.

We can learn much from the Indians. Perhaps if we do learn more about simplicity of life and reverence, we shall understand Indians and many other races better, and help them to learn that a wonderful new age of Brotherhood is at hand. W. M. M.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogenesis

Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

# THE MYSTERIES OF THE HEART DOCTRINE

Prepared by  
**KATHERINE TINGLEY**  
AND HER PUPILS  
*The Theosophical  
book of the  
Twentieth century*

Tells the story and the history of the  
Theosophical Movement.

The prices are \$2 in cloth and \$1.25 in  
paper, which barely cover the cost, for it is  
printed and bound, not gaudily, but with  
such carefulness and thoroughness of art  
and craft as to make it unique among  
modern edition books.

Order now from  
**THE THEOSOPHICAL PUBLISHING COMPANY**

## SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM

by H. P. Blavatsky and William Q. Judge

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"  
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy  
there is given no adequate explanation of the healing  
that is at times accomplished, nor of its *rationale*,  
nor of the ultimate price that must be paid and the  
dangers connected with such practices.

This pamphlet is invaluable to all students.

## Christianity and Ancient Cults

A DEBATE between champions of Christianity and scholars who disparage it by connecting it with ancient religions which they also disparage is not an uncommon spectacle. An instance is afforded by a review in the London *Spectator* of a book on the myths of Osiris, Attis, and Adonis. The writer of the book takes a very low view of these ancient cults; and by tracing the connexion of Christianity with them, throws cold water on the latter. The reviewer makes a weak defense; his weakness is that he admits the major part of his opponent's case—that the ancient cults were corrupt and superstitious, and that Christianity has derived much from them. His only resource, therefore, is to show in Christianity such a difference and superiority as to warrant one in putting it in a separate class.

The view taken by Theosophists is that the ancient cults were *not* foolish and sensual superstitions. It is of course admitted that, in later classical times, there was great degeneracy and that the cults took on various corrupt, superstitious, and sensual aspects. But it is maintained that in their origin, they were pure and sublime allegories. In their symbology we trace the language in which the ancient Mysteries were couched, and in them we recognize various presentations of that ancient and universal Divine Knowledge, which was afterwards so profaned by the selfish and sensual world that its real keys were withdrawn from public knowledge.

Says the author referred to, in an earlier work of his on similar subjects:

It is a melancholy and in some respects thankless task to strike at the foundations of beliefs in which, as in a strong tower, the hopes and aspirations of humanity through long ages have sought a refuge from the strain and stress of life.

And says the reviewer:

Throughout that work he continually connects points of Christian ritual or doctrine with a number of non-Christian practices and beliefs, apparently in order to indicate the purely human origin of both. And the same purpose appears equally in the present volume. He dwells with emphasis on the coincidence of the date of Christmas with that of the nativity of Mithra, and on the fact that it was chosen by the "Christian Church" in order to "transfer the devotion of the heathen from the Sun to him who was called the Sun of Righteousness." He brings March 25th, the traditional date of the Passion, into connexion with the "official celebration at Rome of the death and resurrection of Attis" on that and the preceding day. The feast of All Souls is "nothing but an old pagan festival of the dead." The death and rising again of gods are often referred to, while Osiris "gives his body," or "his

broken body," to feed the people, and "dies that they may live." "The spread of Oriental religions which inculcated the commune of the soul with God and its eternal salvation as the only things worth living for" checked, we are told, the "march of civilization for a thousand years," until with the revival of learning "the tide of Oriental invasion turned at last," and "is ebbing still." And, finally, Dr. Frazer draws a parallel between Buddhism and Christianity as systems which were "in their origin essentially ethical reforms," due to "two of those beautiful spirits who appear at intervals like beings from another world," but which have been "transformed so as to accord in some measure with the prejudices, the passions, the superstitions of the vulgar," though even at their best "both these religions by their glorification of poverty and celibacy struck straight at the root not merely of civil society but of human existence."

The reviewer admits the connexion, but says that "to bring the pure and inspiring teaching of Christ into any real connexion with these licentious cults seems not only to shock the moral sense but to be repugnant to the strict laws of scientific inquiry." Christianity can only be rescued from this slur by drawing a sharp distinction between its essentials and its accidental associations, between its spirit and the corrupt practices of some of its representatives.

But if it is right to do this in the case of Christianity, is it not also right to do it in the case of the ancient cults? If we are to approve Christianity in spite of the infamies that have been wrought in its name since the beginning of its era, and all the crude and debasing superstitions that have been and are still associated with it, what is to prevent the advocate of the ancient cults from putting in a similar plea with regard to them? And he will find more evidence to support him in his championship than the Christian advocates will find in theirs.

It is admitted by the reviewer that Osiris, "Ruler of the Dead, weighing each soul in the balance and requiring that men should have given bread to the hungry and water to the thirsty and clothes to the naked, was assuredly a power that made for righteousness." This alone is sufficient to show that as we trace the systems back from the corrupt later times in the direction of their source, we find greater purity and sublimity.

The reviewer says:

The idea of fruitfulness finds its symbol for the Oriental mind in that union of the sexes without which the race of men and animals must perish. Instead of mother and daughter [as in Greece and Egypt] there appear the divine lover and the divine bride. Beside Astarte, the goddess of fertility, stands the lovely youth . . . and at the side of Cybele, the

Great Mother, is Attis, the beautiful shepherd, who made sacrifice even of his manhood in order that the goddess might be more fully "impregnated with the life-giving energy" which she was "to transmit to the world." Of the original meaning which lurks beneath these strange tales no reader [of the work reviewed] can entertain any doubt. . . . The ancients, and even Christian writers, such as St. Jerome, recognized that Adonis was an image of the sown wheat; and the honors paid at the vernal equinox to the pine-tree wherein Attis dwells lead in clear and historic sequence to the rites with which in spring the maypole was once brought into English villages.

As H. P. Blavatsky so frequently and so strongly urged, the sensual and passionate theory about ancient symbolism is the result of the perversion of the modern mind, aided, however, to some extent by the fact that the pure ancient ideas did actually become corrupted in later times and locally into sensualism. But with the older Egyptians, the earlier Greeks, the ancient Hindü Aryans, and other ancient nations, the symbolism was pure. When Astarte, Isis, etc., were spoken of as the goddess of fertility, it was not the gross animal creative function that was thought of. There have been days—may they come yet again!—when it was possible to conceive of fertility, motherhood, the feminine principle, and allied ideas, without any thought of their merely material or animal meaning. It is only the minds of peoples who are the heirs of ages of superstition, barbarism, ecclesiastical bigotry, and license, that have turned these pure symbols into emblems of animal passions. Bacchus himself, the god of "wine," was originally the God of inspiration, being practically identical, as we are told, with Isis; but in corrupt times the "wine" became materialized into its physical counterpart, and the inspiration degenerated into drunken frenzy.

In these days even a statue of Aphrodite may arouse nothing higher than ideas of physical beauty. But Aphrodite is the goddess of Love in its highest sense, Compassion devoid of all passion and sensuousness. Similarly the emblem of a male and a female, intended to symbolize the All-Father and the All-Mother, the Universal Energy and the Universal Bounty, have naught to do, in their origin, with procreation.

The statement that "Adonis was an image of the sown wheat" is a good instance of the imbecility of the present age, which combines unseasonable flippancy with the solemnity of an owl. To suggest that the *sown wheat might have been a symbol of Adonis* will, one fears, be too much for the mental powers of our scholars. One is reminded of the scientist who amended the line

Sermons in stones, books in the running brooks to

Sermons in books, stones in the running brooks.

Or of Babbage the mathematician, who is said to have written to Tennyson to suggest that Tennyson's lines about a man dying and being born every moment should be altered to—

And one and one-sixteenth is born.

But the above is only one instance of a general practice of regarding the Cosmic Powers as symbols of the objects which were chosen to symbolize them; as, Aurora, symbol of the dawn, instead of the dawn being the sym-

bol of Aurora; Typhon and Ahriman as symbols of the violent and ugly in nature, instead of *vice versa*.

The case is clear that what Christianity borrowed from ancient cults was the degenerated remains; but if Christianity is to outgrow these, the spirit by which it outgrows them must also be borrowed from ancient times. For Christianity cannot claim any originality even in its sublimest doctrines, for they are all remnants of ancient wisdom. The only thing unique about Christianity is its adaptation to modern times and countries. It was the degeneracy of ancient cults that gave Christian dogmatism the opportunity to step in. But whatever good Christianity may have done during the dark ages of our barbarian ancestors, it was but a lantern replacing the true light that had been overshadowed. It is time now that we turned our eyes away from the haunting spectacle of decaying cults and mushroom growths on their ruins, and aspired once more to the ancient wisdom from which all religions and cults have their origin.

It will be found that Adonis was originally a very high conception, being identical with the Egyptian Ptah. The correspondence between the lower forces of nature and the great Cosmic Powers enabled the animal passions to be worshiped under the same symbols as the spiritual Powers; but it should never be forgotten that this was the *perversion of a licentious age*, and that it is our duty to restore the symbols to their ancient dignity. E.

### The Planet Venus

THE Morning Star is now a conspicuous object in the eastern sky and will reach its brightest about the middle of the month. Though the attention of the public has been largely focussed upon the planet Mars in consequence of the controversies respecting the nature of the mysterious lines or "canals" covering its surface, yet Venus ought to have greater claims upon our investigating efforts. Venus is practically the same size as the earth; its density is not much less; according to recent spectroscopic and visual observations it probably rotates on its axis in twenty-four hours; and at times it is only about 26 million miles away—10 million miles nearer than Mars at its nearest.

The principle reason that Venus attracts less attention than Mars is that so little can be made out on its surface. Vague, shadowy patches are sometimes seen under very favorable conditions, and occasionally, when Venus is seen as a half-moon or crescent (through the telescope) the southern horn seems slightly blunted. The presumption is that the planet is covered by a dense atmosphere and that there are high mountains in the south. As such an atmosphere would be favorable for the development of heat it would appear that the temperature of Venus must be very high, and though the sun would seldom be seen through the thick curtain of clouds, the diffused light must be very intense owing to the planet's proximity to the sun. *The Secret Doctrine* speaks of Venus as "the 'little sun' in which the Solar orb stores his light."

Though the astronomers of today cannot tell us much about the conditions upon the planet, certain ancient Hindü works give some curious and valuable information, considered

by H. P. Blavatsky to be substantially correct. The writers well knew Venus and the earth were practically of the same size, and they declared that there was a very close mental and spiritual interaction between them, saying:

Every sin committed on Earth is felt on Uśanas-Sukra (Venus); every change on Sukra is felt on and reflected by the Earth,

and, speaking of the habitability of the planets, the same antique Commentary goes on to say:

Every world has its parent star and sister planet. Thus Earth is the adopted child and younger brother of Venus, but its inhabitants are of their own kind. . . . All sentient, complete beings (full septenary men or higher beings) are furnished, in their beginnings, with forms and organisms in full harmony with the nature and state of the sphere they inhabit.

The orbit of Venus is almost a circle, far nearer that ideal shape than the earth's, and H. P. Blavatsky says that the planet—evolutionally speaking—is proportionally more perfect than the earth. Presumably the inhabitants have solved the problems which agitate us and which will do so until mankind reaches a reasonable degree of altruism and impersonality.

There is some mystery about a supposed moon of Venus, which certainly cannot be seen now, and yet which several reputable astronomers claimed to see on various occasions during the 18th Century. It is said to have looked about the same size as our moon would, if removed to the distance of Venus. H. P. Blavatsky speaks of a time when our moon will have gradually disintegrated into space, but it is not likely that what the 18th Century observers saw can have been a material body of such nature, as its disappearance was far too sudden to be so explained. STUDENT

### Death of Mars

TO our eventual descendants life on Mars will no longer be something to scan and interpret. The drying up of the planet is certain to proceed until its surface can support no life at all. When the last ember is extinguished the planet will roll a dead world through space, its evolutionary career for ever ended.—Percival Lowell, LL. D., in the *Century Magazine*.

"For ever" is a long time, Doctor! If this is what science says, in what is it better than that theology which represents a human soul as having been created at a point in eternity, but, once created, destined *never* to cease? This one-sided duration is a little too (one was going to say "metaphysical," but science has nothing to do with metaphysics). Still it must be confessed that there are difficulties in the way of believing that anything which has once existed can disappear for ever, or that the life-impulse that originally vivified a planet can act but once. The life of a planet, no matter how many millions or even billions of years, measures simply nothing in comparison with eternity—if one can speak in such a way. The utter purposelessness and want of proportion in the idea must strike everyone.

Science needs a God to start its ball rolling. After that, according to the theory, the God may retire and leave the clock to run down. But is this all? May not God perhaps come back again and give the clock another wind? Or some other God, perchance? STUDENT

# Some Views on XXth Century Problems

## The Tide of Liberalism

IN the (Boston) *Hibbert Journal*, Professor Dewey of Columbia University, points out the *impasse* to which the question of religious education has come. "We have got to teach *something* as religion, and that means practically *some* religion. Which? . . . Which Christianity?"

The beginning of religion as a guide to conduct, is the sense of duty. Every child has that. Why not teach the child that the sense of duty is the directing-wand of his own soul? Every religion teaches of the soul, and that it has such a wand, and that the mind can and should follow the pointing.

That seems to be something of an answer to the Professor's next questions:

What shall knowledge of religion as an outcome of instruction mean today? Shall it mean the conversion of character into spirituality? Shall it mean accumulation of information *about* religion?

Why not say "about religions," and then answer *Yes*? For up to a point, all religions are the same. They teach of the mind-self, pulled this way and that by personal and sensual desire, but also guided (if it will be) by the light of a divine soul in the center of the field of consciousness; and of the derivation of this soul from the universal soul, God.

If any Christian will deny that his variety of Christianity teaches that, his variety would seem self-condemned. If he says that the soul *needs* a purifier, rather than *is* one, we should partly agree. For by "soul" he is now meaning either the mind-self or the center of animal desires which draw it to selfishness and sensuality. They do need purification. We only object when he goes on to maintain that there is nothing anywhere in man, and an integral part of the man, which *is* pure and can purify. If that is his Christianity, and if other Christians so far agree with him, then the sooner Christianity ceases to be taught, the better.

For what we have sketched in the fewest possible words is not only the essence of all religions—except Christianity, *if* our Christian is to be believed—but it corresponds to the facts of even the child's experience. He knows himself as a mind which has the power of choice; he knows of the desires that try to pull him down; he knows of the inner pressure to resist them and come up higher, to follow duty. Call that God, and he makes a picture of a man in the sky. Call it himself and he will begin to take pleasure in victories over his lower nature. And as the years go on, coming into closer and closer unity with his own soul, he will be prepared to sense the All-Presence of that supream form of being which is only limited and defaced by subjection to mental forms, dogmas, and definitions. Thus religion becomes a statement of experience. That is why religions are identical in essence, Christianity included. But Christianity, owing to the desire of its adherents, from the very first, to separate their religion from all others, has lost the very best of Christ's teachings—partly an actual documentary loss, partly a loss by misinterpretation and half-

interpretation. But both losses can be undone if Christians will set themselves to a study of the other great world-creeds, not to find differences but resemblances, not to glorify their own creed but to unify it with the rest. That is the only way to save their own from submergence in the advancing waves. Their present movement, visible here and there, to come to some sort of unity amongst themselves, is no part of the movement we urge upon them. It runs in the contrary direction and will hasten the submergence. For it is a contracting, and even selfish and frightened, movement for self-defense against the rising tide of external liberalism and research.

STUDENT

## "All Men Are Equal"

DR. DRAPER, State Commissioner of Education, has been protesting against the traditional doctrine taught to every American child—that he has it in his power to become President of the country.

I think we make a mistake in telling the child that he can be President of the United States. It is not a mistake to tell him that he is eligible. But we do not explain the remoteness of the possibilities.

The remoteness will become extremer the nearer this country approaches to its ideals. Theoretically, the President is the wisest man whom the electors have been able to get sight of. It is true that that wisest man, as well as the less wise men whom we shall choose before we learn how to see the wisest, may be born in any station of life whatsoever. We ought to be able to tell the children that the *social status of their parents* has no relation to their possibilities of attaining the Presidency. Beyond that we have no right to go.

It is true that men are born equal in respect of certain rights; it is not true that any two are born equal in respect of any single capacity. The right to be President should rest on the capacity to be President, and on nothing else. How many men at any given time have that capacity? A dozen? Three or four? One? We should teach the other ninety-odd millions to *reverence* the moral height and intellectual magnitude of such capacity, to reverence any man visibly having it, to try to get it—it, the capacity, the height, *not the office*. For if you generate in them the ambition for the honors and conspicuousness of the office, in that ambition is the most potent enemy to the attainment of the moral height which is the chief element in the capacity and therefore in the right. Moral greatness *excludes* ambition; it is, in its very self, pure desire to serve, pure forgetfulness of self. The other element is an intellectual capacity to serve, equal to the desire to serve. Having granted the possible attainment of this sublime *desire* to serve, do we maintain that every child may gain the intellectual *capacity* to do so? Yet in the absence of either, his supposed "right" does not exist.

If men knew of Reincarnation they would not talk so much nonsense. Of two men, one wasted his last life in folly, dissipation, novel-

reading and the rest; the other developed every moral and mental capacity throughout all the years of his manhood. Another life, this present one, comes. "All men are born equal"; the empty-minded novel-reader, forsooth, stands equal-capacited with the other who for fifty years never drew an idle breath! It is time we taught the children to look the facts of their own natures straight in the face.

STUDENT

## "The Conceit of Being Good"

IN the current *Hibbert Journal* Professor William James remarks that "to give up one's conceit of being good is the only door to the universe's deeper reaches." What he means by deeper reaches, or part of what he may mean, comes out later. Certain specific religious experiences, he says, "point with reasonable probability to the continuity of our consciousness with a wider spiritual environment from which the ordinary man is shut off."

He is cut off by several things: sometimes by the active futility, or futile activity, of his mind. But the "conceit of being good," and the kindred conceit of being "elected," are worse bars. They are *egotism*, and "the wider Spiritual Environment" has no use for egotists of any kind and will not confer its acquaintance upon them. It only wants people who have forgotten their *self* in wide and deep love of humanity.

What is this "Spiritual Environment"? It may be *felt* by any few who, gathered together for some high purpose, have reached an inner unity so deep that for a little while there is *silence*. There is sometimes a moment of its presence in churches between the ending of the solemn invocation, "And now may the peace of God which passeth all understanding..." and the beginning of the rustle of silks. But for that, the preacher must have some idea of the weight of his own words and have got beyond himself.

For this "Environment," which that particular word almost empties of its true content, is a Presence, the very Spirit of human Harmony, and only through that harmony knowable or approachable. It is that Light in human consciousness which looks upward through our eyes in reverence; upon those who need it from us it looks down in compassion; and upon our fellow-workers, in harmony. Reverence, loyalty, compassion, harmony, these are all one, the marks of and the work of that Presence. Man's central being is its "First-born"; but through the ages he has broken away from himself, his ideal—yet still existent—self, coming down and down the stairs, more and more lost in the desires and futilities of his own mind. This is the meaning of H. P. Blavatsky's sentences:

... That undying spark of love which forms—nay, *must* form—the essence of the "First-born" out of the homogeneous essence of eternal harmony and light, and is the element of forgiving reconciliation, even in its last terrestrial offspring—Humanity. The loving essence cannot be extinguished but only perverted.

SCULPTURED MOONSTONE, TO EAST OF DALADA MALAGAWA, ANURADHAPURA, CEYLON

## A "Moonstone," Anurādhapura

THESE semi-circular stones are found at the foot of flights of steps in all parts of the ruins; the general design is similar in every case, but no two are precisely alike, either in arrangement or detail. Usually the outer rim is carved with a procession of the elephant, the horse, the lion, and the Brāhmany bull; the next two or three circles bear designs of the stem and leaf of the lotus plant; inside these is a procession of the *hamisa*; and finally the flower and bud of the lotus. B.

## Ancient "Negro" Civilization in Nubia

UNRAVELING the skein of history by archaeological research is a slow and difficult process, because the new facts discovered, instead of fitting into the blank spaces in our puzzle, more often than not merely start new clues. The facts are odd pieces belonging to a very large puzzle, and they will not fit together unless we take a very large number of them and lay out our scheme on a very large scale.

Explorations in Northern Africa are not being confined to Egypt proper, but are being extended to the territories lying southward, especially since the latest British military expedition up the Nile. The sites explored have been that of the ancient Ethiopian Empire, the vice-regal capital of which is said to have been, under the earlier Pharaohs, Buhen, the modern Wady-Halfa, and the later capital Napata in the Dongola province of the Anglo-Egyptian Soudan; and the region further north between the First and Second Cataracts.

It seems that under the Roman Empire, this latter region was neglected; and that a high Nubian civilization existed between the First century B.C. and the Fourth A.D. Excavations have revealed necropoleis, temples, palaces, sculptures, inscriptions in the still undeciphered Meroitic script, and glass

work and pottery with new geometrical and floral designs. A report states that—

"It is certain the people who evolved this civilization were negroes. They owed something, certainly, to the active commercial intercourse they carried on with Egypt during the Greco-Roman period, but part at least of their civilization was of indigenous growth. There is both architectural evidence and a considerable body of tradition . . . tending to show that the earliest civilization in the Niger countries reached the Western Soudan from Nubia. That civilized negro states existed in West Africa at a very early age is undoubted, but their connection with Egypt has never been proved."

The use of the word "negro" is apt to be misleading, when it is applied indiscriminately to any people of Ethiopian type in Africa. Such peoples may differ widely among themselves, though presenting an appearance of uniformity to the casual view of one belonging to another human family.

It will scarcely be possible to reach any conclusion with regard to the origin of the Egyptians from this or any other isolated fact. Egyptian history is vast, both in point of time and in the commingling of races. As pointed out by H. P. Blavatsky (*The Secret Doctrine*, vol. II, p. 746), Egypt is far older than the present Europe. Atlanto-Aryan tribes began to settle on it when the British Isles and France were not in existence. The Delta was formed gradually through long ages by deposition from the then Nile. Yet even the Delta has been firm land inhabited for more than 100,000 years. Later tribes, with still more Aryan blood in them, arrived from the East, and conquered it from a people whose very name is lost to posterity, except in Secret works. And this natural barrier of slime was, till within a few thousands of years B.C.

the best safeguard of the late Egyptians, who had managed to reach it through Arabia, Abyssinia and Nubia, led by Manu Vīna in the day of Viśvāmitra.

Again we read (*ibid.* p. 743) that the latest, seventh, sub-race of the Atlanteans, already swallowed up in one of the early sub-races of the Aryan stock, gradually spread over the continent and islands of Europe as these emerged from the sea. Descending from the plateaux of Asia, where the two races had sought refuge in the agony of Atlantis, it slowly colonized the freshly emerged lands, increased, divided into many families and nations, including the Egyptians, Greeks, Phoenicians, and Northern stocks.

Thousands of years later, however, other races—remnants of the Atlanteans—"yellow and red, brown and black," began to invade the new continent. There were wars, in which the newcomers were defeated, and some fled to Africa, others to remote countries.

Thus is accounted for the existence of black civilizations alongside of the lighter skinned ones. But it is apparent that the latter did not spring from the former. The accounts of the aforesaid wars between the two races are preserved in the traditions of many ancient nations, such as India and Greece. The degenerated offshoots of the defeated ones are found in various remote corners of the earth, still preserving mysterious relics of their ancient origin. Of the "Northern stocks," mentioned above as forming one part of the Atlanto-Aryan settlers, mention has recently been made in the CENTURY PATH in connexion with Scandinavian antiquities.

The story of ancient races, as outlined in H. P. Blavatsky's works, and as illustrated both by the universal consensus of tradition and by the testimony of archaeology, is extremely interesting. It throws a clear light on many problems. STUDENT

## The Natural Balance

**A** BOTANIST or forester, Mr. W. H. Ballou, begins a well-informed article in the *Scientific American* as follows:

Practically all of the chestnut trees of the Eastern States are dead, destroyed by a small deadly parasitic fungus. . . . The government forestry service estimates that one-third of the pine trees of New England are dead from a leaf blight.

Speaking of a fungus that attacks the white birch, he says:

Nearly all of the white birches of Ocean County, N. J., are dead and covered with these brackets.

Then he refers to another fungus which is creating huge havoc among the Eastern locust trees. And so on.

The first question that arises from his account is: Are the trees of the Eastern States, as it would seem, more thoroughly the prey of parasitic fungi than those of the Western, and if so why?

And secondly: What cause is now recently operative to favor the appearance of destructive fungi? If the cause were not recent, if it had been operative in its present strength for a thousand years, the forests the fungi are now attacking could never have grown up. In any given area the forests consist of trees capable of survival in the conditions there obtaining. The life is competitive. When the conditions change suddenly and markedly the plant and tree life alters. The old forms and species cannot support themselves; forms and species appear which are capable of holding their own.

It would seem, therefore, as regards these Eastern localities, either that there has been some obscure change rendering the trees unable to maintain their resistance to the fungi that are now proving fatal to them: or that the fungi were until recently not present at all. In which case, what change in conditions has enabled them to be present and to grow?

Destructive fungi are either saprophytic — living on dead wood and vegetation — or parasitic, living on live vegetation. The external or formal differences are often inconsiderable; the microscopic or cellular differences if any are undiscoverable. That is, there are no cellular types peculiar to the two varieties. So far as we know, and it seems likely enough, parasitic "mutants" might arise from slight changes in conditions, in saprophytic fungi.

So it is change in conditions that we seek; what it is we do not as yet know or suspect. It is recent; it favors the fungi and disfavors the trees; and it appears to apply to the East rather than to the West of our broad country.

## Man and Music

**J**OHAN STUART MILL was oppressed by the thought that every possible phrase in music had either already been used or soon would be, that the resources of music were exhausted. It only remained to us to repeat and repeat until we were tired, and then renounce the art.

A scientific musician has recently pointed

out that the possible subtleties of music need never fail to keep pace with the evolution of feeling. He says nothing new, nor professes to; merely suggests that we employ the wisdom gained by looking back, in looking forward.

Our scale is extremely recent in its complete form; intervals which are common in every line of our music were regarded as intolerable three or four centuries ago. In the seventeenth century even the minor third, and still more the minor sixth, were looked upon with much suspicion. Have we reached finality?

Suppose the scale has not yet reached finality. Suppose that instead of seven notes it shall come to have seven times seven. It is only a question of extending the process by which we got the seven.

A stretched string, struck, vibrates in its whole length and yields a root tone. In a moment the two halves also vibrate separately, yielding the octave. Then the three thirds vibrate, yielding the fifth above that. Then the four equal parts vibrate on their own account yielding the double octave of the root note. The five equal parts yield the major third above that, and the six, the minor third above that again. And so on, the harmonics rising higher and higher with shorter and shorter intervals. Soon they are so high as to be inaudible. It is these harmonics, translated downward to their lower octave, or double or triple lower octave, which theoretically constitute our scale. But if we translated downward a few more of them, from regions still higher, we should find we were beginning to get notes of even less interval than our semi-tone. Always following nature, therefore, it would or will be possible to make a scale that shall contain as many notes as we need to express our feelings. The chords will follow. And though there would be mechanical difficulties for some of our present instruments, those with fixed tones, invention shows no signs of failing in ability to meet this or any other requirement.

## A Bit of Old Science

**W**HY do not rivers become blocked with their own sediment, so blocked that they overflow their channels, find others, or break up into wide deltas and leashes?

Sometimes they do, but that is only when their progress is very leisurely. More usually they deepen their channel instead of filling it. Only when they reach the sea do they throw down the sediment, make great bars and widen out into shallow deltas. Why? Because, runs the usual explanation, their course is checked by the sea's resistance; moving more slowly they have time to deposit the sediment. That is no doubt a part cause, but, it would seem, not the whole, perhaps not even the chief.

Mr. Acheson, of Niagara Falls, has thrown considerable light upon the matter — as also upon the knowledge of the ancient Egyptians. Why did they use straw for their bricks? Was it for binding? But its fiber is much weaker than that of many other vegetable materials

available. The experimenter found that clay, boiled in water along with any one of a number of vegetable matters — tannin, straw, dextrine, or the barks of several plants and trees — remained suspended in the water in a state of very fine division, so fine as to pass through filter paper. It was in fact in a colloidal or semi-colloidal condition. Graphite, when it was treated with these vegetable matters, behaved in a similar way.

But the addition of salt quickly precipitated it. Now boiling enables water to do rapidly what it would otherwise do slowly. As a river pursues its way, washing off mineral sediment from its valley walls, it also makes an extract from the roots and leaves of the vegetation. Part of the sediment therefore enters into the colloidal or jelly condition and remains in almost permanent suspension — until the salt of the sea is reached. That precipitates it into the bars and deltas of the river mouth.

Evidently the Egyptians knew of this colloidizing effect and found that clay thus treated set into much denser or harder bricks. How many thousand years have passed since that bit of science was forgotten — to be now re-discovered?

## An Epoch's Birth-Anniversary

**I**T is a little difficult to imagine oneself back to the day and the days before July 1, 1858, just fifty years ago. On that day — and also, to commemorate it, on the same day of this present year — the Linnean Society of London held a meeting. A paper was read which was the joint production of Darwin and Alfred Russel Wallace, innocently wording its subject as "The tendency of species to form varieties, and the perpetuation of varieties and species by natural means of selection." Things immediately began to hum; in fact a new epoch in science — not to say also in religion and philosophy — began to hum itself into audible and visible being. Discoveries which merely add to existing knowledge, which overturn nothing, are sometimes called epoch-making. This discovery could only add by first supplanting. Can we imagine the nature of the next of equal import? Perhaps this: that the variations are not fortuitously in every direction, but, tending in one definite direction, indicate a purposive *vis a tergo*.

It is interesting to note that jealousy had no part in the make-up of either of these discoverers. Darwin, while he lived, always referred to Wallace as his co-discoverer. And Wallace took the occasion of this anniversary meeting to say that while it was true that the idea had occurred to himself and Darwin independently, it had nevertheless occurred to Darwin nearly twenty years sooner than to himself. During that time Darwin "had been laboriously collecting evidence and carrying out ingenious experiments and original observations." This makes a refreshing contrast to a commoner spectacle, that of rival claimants spreading their eager egotism over the columns of scientific journals.

How Modern Scientific Agriculture  
Vindicates Vergil and Varro

A READINESS to admit the wisdom of past ages will not detract from the wisdom of the present age, but, on the contrary, will demonstrate it; for it is not the mark of wisdom to belittle what was good in the past while at the same time slavishly copying much that was bad. Yet we often find that those who disparage ancient ideas are themselves bound hand and foot to half-pagan half-Semitic theological traditions, and to modes of thought which can readily be traced to the prejudices of their ancestry. No one with real wisdom need fear to discredit that wisdom by evincing his ability to recognize wisdom in others; but he who is unable to discern wisdom from folly proves his own lack of judgment.

And so the progress of our race toward enlightenment will be marked by an ever increasing ability to profit by the experience of past ages and by a progressive emancipation from that stage of fatuous self-conceit which has marked the earlier stages of our intellectual emancipation. First we slavishly imitate our elders; then, in the first bloom of our youthful independence, we sneer at them; afterwards we learn to recognize both their merits and their limitations, and to gather from their wisdom an inspiration to try to make ourselves still wiser.

Archaeological explorations and the translation of ancient languages have done much towards emancipating our minds in this way. The same process is extending in all directions and causing us to call in question the superiority of many things in which we had deemed ourselves especially superior; whereby we get the better chance to show our real superiority.

Take, for example, the case of agriculture. In an article called "The Secret of the Soil," in the London *Spectator*, which is a review of a book, we find the atmosphere of the classical student mingling with that of the agriculturist, and resulting in a comparison highly favorable to Vergil and Varro. The main impression which the reviewer seems to have received from his book is that the fruits of modern scientific agriculture have gone to prove the wisdom of the ancient farmers.

For instance, one result of modern study is that *tillth* counts for far more than manure, being indeed the prime necessity of the soil. Another is that certain crops act as fertilizers by their power of gathering to themselves certain nutritive constituents of soil and atmosphere; hence the *rotation of crops* and the sowing of certain crops for the sole purpose of *ploughing them in*. But both these prin-

ciples were known and practised by the ancients, as witness Vergil and Varro. These old writers advocate the sowing of certain crops to be ploughed in, and emphasize the importance of spending hard work upon the soil to render available for the plants those ingredients it already has in such abundance.

The point is made that it is only recently that we have recognized the *nitrogen-fixing* power of certain crops, thereby swinging from an over-addiction to manures towards the principles advocated by Vergil and Varro; and it is asked, If this is so in respect to nitrogen, may it not later on prove to be so in the case of phosphoric acid? For the writer of the book contends that *phosphoric acid* is the one thing that does need to be added to the soil, and the reviewer thinks he ought not to be so dogmatic on that point, because science may yet discover ways of providing phosphoric acid also without recourse to artificial fertilizers, and may thereby vindicate the ancient agriculturists again.

How much is there still waiting for the farmer to discover of the soil, which Varro wrote 2000 years ago, and man had been learning for uncounted centuries before him? If the need for good tilth still remains the greatest need of all, what have we learnt that the Roman farmer did not know?

Another point made is that we have learned to regard the soil as *alive*, thereby again refuting our immediate predecessors, who regarded it as *so much dirt* to be shoveled about, and vindicated those who taught us to speak of "Mother Earth." Not only is the soil, for the modern scientific farmer, a mass of living microbes and creatures, but even the

so-called "inorganic" parts are every day being brought by chemists more under the head of *living things*. The difference is that we consider this life in its minute details and the ancients regarded it rather in its wholeness. Is not this a great step towards emancipation from the ignorance of a transition age and the return to the knowledge of a wiser previous age? How long will it be, one wonders, before the *nature-gods* reappear on the modern stage tricked out in their new scientific togs, and with long names borrowed from the languages of the very peoples whose ideas they are supposed to supplant? As the ancient farmer burned offerings and poured libations to the genius of the place, so we may learn to burn fumigants and pour antiseptics. We still pray for rain and return thanks for harvests; but it were better if, instead of carrying our petitions to the throne of thrones, we tried to earn the bounty of Nature by fulfilling our duties as divinely-informed beings.

Electricity plays a leading part in natural phenomena, and the study of *cosmic electricity and magnetism* is the key to future weather wisdom. But what is prior to electricity? The currents and conditions generated by man in the "Astral Light," the invisible womb of visible Nature, determine the course of the life-forces in the soil and the plant. It was the knowledge of this connexion that inspired the rites of sacrifice and propitiation, which, however superstitious in later days, were originally ceremonials of the ancient Science—that Science which included the understanding of life in all its phases, spiritual, mental, physical, cosmic, human.

## THE ANSWER

C. E.

**A** BITTER lot, through cold and frost,  
The seed to sow in pain and tears,  
Then stand aside, our labor lost,  
While others reap the Autumn ears.

'Tis hard to toil for others' good,  
The wretched soothe, their fears to still,  
And then to reap ingratitude  
Or malice wreaking deadly ill.

Where shall we gather strength to rise?  
How shall we still all vain desire?  
Can we indeed grow pure and wise  
By passing through this Moloch fire?

The answer comes through ages dim  
From all who've suffered, wept and died,  
And softly, clearly down from Them—  
The Great Ones who were crucified.

It bids all selfish cares to cease—  
To make each other's griefs our own—  
'Tis thus the soul shall find true peace,  
Nor shall it tread this path alone.

'Tis thus the ills and woes of life  
May leave no bitter, poisoned sting,  
For though they bring us toil and strife  
They drag not down the spirit's wing.

Thus, though the wrongs we strive to right,  
May sadden through the passing years;  
Upon the soul they leave no blight—  
No gall is mingled with our tears.

## The True Philosophy of Life

**T**HE history of every age and race presents to us the incontestable fact that our beliefs vitally affect our lives. It may seem to some of no importance what our beliefs may be so long as our hearts are pure and our motives unselfish. But while "ignorance is better than head learning with no soul wisdom to guide it," and while the man of pure motives will eventually gain the knowledge necessary for right conduct of life, there should be nothing to hinder us from so developing here and now the latent possibilities of both heart and mind that truth will appeal to us. A pure heart and an open mind, a blending of mind and soul will in no long time render us immune to false beliefs. They will not attract us, for they will not be in harmony with our condition.

Among the many selfish ambitions and hypocritical accomplices in the atrocious cruelties that have in past ages been inflicted upon humanity in the name of Christ, there were undoubtedly a few who were sincere in their false beliefs. But however sincere they may have been, their hearts most certainly were not filled with compassion for all that lives, and their minds being warped and deluded by a powerful hypnotic influence proceeding from united bands of evil workers, were not under their own guidance. Also, thousands not to say millions of followers innocent of action, being under the same psychological influence would have deemed it blasphemy to protest.

All compassion was stifled in their hearts by fear, and their minds were enslaved. The direful creed that was forced upon them they dared not oppose even if a ray of light had given them a desire to do so. A mental slave has no freedom of mind, just as a physical slave has no freedom of body.

Even at the present day the same influence of persecution and bigotry though more cautiously and secretly, is at work. Wrongs are inflicted upon humanity. Thousands among us are slaves, and even those who consider themselves free agents, are controlled by one or another falsity that panders to weakness or vanity. If we were under the sway of our own reason and were free from coercive suggestion from others, should we follow, as we do, many of the foolish, not to say ridiculous, fashions of the day, and adopt the meaningless and demoralizing customs that now control our unsatisfied lives? Are we mere puppets that dance to the tune of the wirepullers? We shall never be truly enlightened until we become real live actors in our own life drama, uninfluenced by anything but the light of conscience and reason.

What is the true function of the heart? Is it not to hold compassion for our fellow beings? What is the true function of the mind, if not to employ it on those loftiest and most vital of all themes—ourselves; the purpose of our existence in a material world; and the methods whereby to work with divine law in order to reach the goal intended for us? In order to be intent on such subjects we need to have our minds wholly in our own keeping. We need to think for ourselves. It is our right to think, still further it is our duty to do so. To give up our thinking to be done by another is to yield up the noble prerogative that *distinguishes man from the animals*.

Who would think of giving up all physical action and sitting with folded hands throughout a life-time? Yet such a course would be much less harmful than having our opinions and beliefs cut and dried for us with only a slavish acceptance on our part.

Let us then use our God-given powers, let us hold our minds in our own keeping and maintain freedom of thought and freedom of will and above all compassion of heart, and thereby we shall be appealed to by a philosophy of life that will answer all our needs.

Where is such a philosophy to be found? Does science give it to us? No. Science of today prides itself on not meddling with any question of ethics, and in its gropings on the material plane it fails to give us a right perception of even external things. By entering into knowledge by the back door of only material observation, although it discovers many important facts, yet it fails to correlate them into a logical system that will stand the test of time and further research. It takes no note of universal spiritual law which harmonizes facts on all planes of nature and by which science, philosophy, and ethics are so inter-related that they cannot without detriment be separated, and a recognition and study of universal law as governing the whole of nature would give science that broad view which leads to unerring knowledge concerning any one of its departments.

As science gives us nothing to live by, we look to religion for aid. But what does so-

called Religion, with its numberless antagonistic sects, do for us in the way of explaining life's problems, in giving us a system whereby we may conduct ourselves and our affairs in a way to ensure prosperity and happiness? Are we pretending to superior enlightenment, prosperous physically, mentally and morally? Are we as a whole in that happy condition which is ensured to those who are living in strict harmony with divine law? Do we know the law? Shall we ever learn the law until we have suffered the full penalty of our ignorance in that regard? Judging from our present miseries, it would seem not. If, however, we strictly obeyed the ethical teachings of Jesus as contained in our Scripture and unimpressively given out by the churches, we would be in a fair way to gain more knowledge. We would be in that condition which leads us to search for knowledge. We would begin to realize that the increasing horrors that obtain among us and with which we so unsuccessfully cope are possible only on account of our erroneous methods of conducting life. We practise extravagant self-gratification but do not find happiness. We pander to the lower nature of others but do not thereby give them happiness. We find that it leads them only to crime and misery.

Now, while the ethics of Jesus were perfect and precisely those of all great Teachers, yet he did not so far as we know give a system of philosophy. Should not this very fact lead us to infer that we are to look elsewhere for a supplement to his teaching? Where shall we find it? In Theosophy, or the Wisdom-Religion, parts of which are the fundamental truths of all religions, and which is to be found in varying fulness in the sacred scriptures of the world. It can answer all our crying needs. Is it something new and untried that we should regard it with caution? No; it is as old as the universe, and has been tested and tried by past races far in advance of us. Is it something to be feared because it startles us from our moral and mental apathy? No; for until we are so awakened we shall remain in the sleep that leads to death.

But as this grand and ennobling philosophy interferes with our vices and weaknesses we hesitate to accept it, and are prone to ask how we can know that it is true. Let each one for himself observe its working and practise its precepts, then there will be no need of argument in its favor. It transforms the lives of its votaries. It offers such sure rules for guidance that those who live up to its teaching, and just in proportion as they do so live, will have their efforts attended with success, the higher, the only real success. M. J. B.

A PLACE has been found at Point Loma to prepare teachers to go forth at the proper time. They will be trained in the understanding of "the laws of physical life, and the laws of physical, moral and mental health and spiritual unfoldment," and a great spiritual wave will touch the World through their efforts in this direction. Not until then will the deeper and grander teachings of Theosophy be grasped and lived by the now discouraged members of the human family. For not only must Theosophy as a philosophy be well understood, but human nature and its needs and the one great secret of knowing how to touch the human heart.—*Katherine Tingley*

## THEOSOPHICAL FORUM

Conducted by J. H. Russell

**Question** What has Theosophy to offer the practical modern world and how can it be proved to be true?

**Answer** Theosophy offers the modern world the ancient reality from which all counterfeits have been copied, and its philosophy teaches each man how he may prove it for himself.

The modern world is not so practical as it would have you believe. The many inventions and discoveries which distinguish this as a most progressive age are due to a greater material application of nature's laws and a willing activity in working with them. The acquirement of freedom, power, and range of action by means of nature's forces has been so great as to dazzle the modern mind and blind it to the necessity of also knowing and working with natural moral law. The old impractical theology was mainly concerned with providing suffering enough for the sinners after death; a practical modern world would evolve a theology showing man how to find the joy of real life as it could and should be here on earth. The awakening higher nature to-day demands recognition and opportunity for expression. Modern materialism is in effect an effort to deflect the operation of the natural moral law—a most impractical thing to attempt. The tendency of all things and conditions is to restore harmony and equilibrium. This is equally true in the material and in the moral realm where we are not "punished for our sins but by them."

The commercial standard of the age would make money and power the measure of values and the sign of success. We are all so psychologized with the sordid standard of life that the reformers, educators, preachers, and poets often voice their messages with a note of apology for urging what seems like an impractical dream. We have become so used to slums and disease, to unsatisfactory education, to vices of youth and manhood, to physical taints and disability, to marriages of ambition and self-love, to increasing insanity, suicide, and inhuman crimes, that a belief in the poetry and beauty and joy and largeness of the natural life is too often regarded as an amiable weakness. Meantime the moral friction and waste motion is no less disintegrating to the social organism than a like faulty adjustment would be to a complex machine. Is it not a most impractical method for the modern world to expend its increasing powers mainly in handling the results of wrong living instead of learning the logic of the natural life which must result in health and happiness? Theosophy teaches the divinity of man which impels him on through the mistakes of many lives until he shall fully realize that he is a soul, capable of making life divine on earth and of creating his own conditions of heaven between lives.

The practical need of the modern world is not for more machinery and mentality wherewith to harness nature's forces for selfish use. Genuine Theosophy is known from its counterfeits by teaching and working for the humanitarian use of the individual powers rather than by advising unnatural cultivation of self-

seeking personalities, who may easily prove to be unfit to use what power they already have. The physical, mental, and social diseases of to-day show the disintegrating effects of impractical methods to evade the claims of the higher self and to ignore the fact of brotherhood, which unites us to all classes of men and to all kingdoms of nature. The individual cannot be morally out of adjustment to life above or below him without causing suffering and enduring it by his inharmony with the whole scheme of things. Life was not meant to be the diseased, sordid, stunted, painful thing it has become. The practical need of this materialistic age is a knowledge of man's divine birthright and his natural capacity for a life here and now that will make his present living seem the gross, unnatural nightmare that it is.

For the individual who attunes his life to the key-note of his Higher Self, there will be no danger or difficulty in practically proving the teachings of Theosophy by the process of becoming one with the truth. R.

**Question** We all long for simplicity; how is a knowledge of Theosophy going to help one attain it any more than any other system of philosophy?

**Answer** The question assumes too much. The majority of us do not long for simplicity by any means, we have no strong desire for fewer of the externals of life.

The consensus of the desire of the world is for more display, more sensuous enjoyment, and while it is true that men live in experience and, by the knowledge they gain through it, learn its true nature; yet instead of profiting by their experiences, the great mass of humanity, having lost their hold on the true knowledge of life, have yielded to the demands of the lower nature and so seek ever to renew and intensify those experiences which will gratify its insatiable demands. How long will it be before they realize that happiness can never be found along that path, or through gratification of self?

William Q. Judge says:

The baby has first to learn that fire will burn its little fingers, before it will learn to avoid the fire. So also with the votary of pleasure; until he has learned the cheat and how utterly inadequate are all sensuous enjoyments to satisfy a living soul, he will seek these enjoyments as a child cries for the light or vainly reaches out its frail arms for the moon.

So the longing for simplicity implies a state of development of the soul, strong enough to make itself felt on the personal man. It is easily seen that this state is not universal. It is now and always has been, so far as we may learn from history, comparatively rare.

The various cults of Europe and America who recommend some irrational and fanatical ideas of diet or hygiene as the test of a simple life tend to make their followers ridiculous in the eyes of the world. They often seek by unbalanced austerity or asceticism, which is not simplicity, to recuperate from equally unbalanced enjoyment.

Plain living and high thinking appeals only to the few. Indeed, we may repeat:

How few think justly of the thinking few!  
How many never think, who think they do!

The great teachers of the world by the identity of their systems, would seem to have had some bond of fellowship and some common source of knowledge. Theosophists assert they had, and that that source was, and is, Theosophy.

There are many proofs that all systems of philosophy and great world-religions, originated in this all-comprehensive wisdom.

Modern philosophy in company with the various branches of science today, has become infected with the spirit of the times and is contented with the husks of knowledge, but the true philosopher, he who has the "love of, inducing the search for, wisdom" strong enough to lead him to discard, one after another, the superfluities of life in order not to hinder his search, must find Theosophy somewhere along his path, no matter from what starting-point he first set forth.

In the meanwhile there come to all who take up this effort to live on higher simpler lines, the daily temptations from the strong pull of the tendencies of former lives, as well as the compelling influences of the world, to lose sight of the austere beauty of simplicity.

As one's ideal becomes higher and one's purpose more unselfish, so does the necessity of living a simple life become more apparent, and there comes the strong feeling which grows to certainty that simplicity is an absolute necessity if we would achieve the higher purposes of our existence. G.

INQUIRER. But what is Karma?

THEOSOPHIST. As I have said, we consider it as the *Ultimate Law* of the Universe, the source, origin and fount of all other laws which exist throughout Nature. Karma is the unerring law which adjusts effect to cause, on the physical, mental and spiritual planes of being. As no cause remains without its due effect from greatest to least, from a cosmic disturbance down to the movement of your hand, and as like produces like, *Karma* is that unseen and unknown law which *adjusts wisely, intelligently and equitably* each effect to its cause, tracing the latter back to its producer. Though itself *unknowable*, its action is perceivable.

INQ. Then it is the "Absolute," the "Unknowable," again, and is not of much value as an explanation of the problems of life.

THEO. On the contrary. For though we do not know what Karma is *per se* and in its essence, we *do* know *how* it works, and we can define and describe its mode of action with accuracy. We only do *not* know its ultimate *Cause*, just as modern philosophy universally admits that the *ultimate* cause of a thing is "unknowable." . . .

INQ. But surely all these evils which seem to fall upon the masses somewhat indiscriminately are not actual merited and *INDIVIDUAL* Karma?

THEO. No, they cannot be so strictly defined in their effects as to show that each individual environment, and the particular conditions of life in which each person finds himself, are nothing more than the retributive Karma which the individual has generated in a previous life. We must not lose sight of the fact that every atom is subject to the general law governing the whole body to which it belongs, and here we come upon the wider track of the karmic law. Do you not perceive that the aggregate of individual Karma becomes that of the nation to which those individuals belong and, further, that the sum total of National Karma is that of the World.—H. P. Blavatsky, in *The Key to Theosophy*

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

## The Unrest of the Age

IN an article called "The Century of Shriek," in *Black and White* (London), Mr. Geo. R. Sims divides modern degenerates into two classes: the sluggish inert, and the excitable erratic. The latter class he proceeds to discuss.

The excitable erratics give free and frantic expression of opinion on all matters of public interest, and their clamor drowns the voice of common sense. The fact that those who make the most noise have been accepted as representing popular feeling has brought about a condition of things that is perilous. Today hysteria is making history. The two great safeguards, phlegm and a sense of humor, have been swept away. Wherever we turn, our ears are split with the cries of a clamoring crowd of excitable erratics. Causes whose advocates used to be regarded as cranks and laughed at or pitied are today hailed as burning questions of the hour.

How often do we hear sober-minded, common-sense, "old-fashioned" people discussing the childishness of the present day, the absolute idiocy of some of the cries and crazes that are sufficiently wide-spread to be described as popular. These cries and crazes are but testimony to the presence in our midst of a vast army of degenerates. The feeble-minded and the degenerate grow up, but they are never *real men and women*. They are grown-up children with capacity for mischief fostered by the increased opportunities they enjoy as "grown-ups."

And he gives instances of the ways in which this body of unbalanced emotional sentiment expresses itself, rushing every way to extremes.

Commenting on the above, let us ask what is the reason why the newer generations are growing up without the safeguards of equality which sufficed to keep their parents in order. It is because the influences that make for stability have not increased in the same ratio as those which make for unrest. The age is one of rapid progress in the facilities and luxuries of civilization, and all who are born in it find themselves exposed to temptations and distracting influences which did not assail their fathers. They are endowed with a far finer and more sensitive nervous system and decreased hardiness. To cope with these altered conditions, however, they have no corresponding increase of knowledge; on the contrary, the old faiths are rapidly disappearing. Hence a generation of people with

## MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

increased opportunities and facilities, but with diminished sense of responsibility, diminished faith, diminished moral anchorage.

When people have no sense of a deep full inner life, they have to cheat themselves into a sense of being alive by excitement; just as stimulants are taken to try to replenish an exhausted vitality. It is the lack of an inward life that is responsible for all this artificial neurotic life. We may discuss drink, drugs, and other proximate causes; but at the root of all lies that necessity for excitement, due in its turn to the want of a true sense of life.

How shall we regain the peace and repose of an age of knowledge? We cannot do it by attempting to flog life into old dogmas that no longer convince the age. The age has advanced, and our beliefs need to advance along with it. Whatever anchorage the old-fashioned steady ones may have in their own inner consciousness, they seem unable to impart it to their children; they can only cry, "Why don't you sit still and behave, like us older folk?"

The fact that there is such a thing as an inner life at all needs to be brought home to people in a way that they can understand and appreciate. There are few souls nowadays whom the "grace of God" or the "power of Jesus" can infuse and suffice.

What is Man? What is the purpose of Life? Is it an everlasting pursuit of whims and desires, a ceaseless dance to the spurring of *ennui* and vacuity? Does Man dangle momentarily across the stage, a mere marionette?

Such questions will have to be answered, and answered satisfactorily, for we cannot go on indefinitely living on our capital of inherited virtues. The mind and soul need feeding as well as the body. That is why people are seizing upon all kinds of pabulum in the hope of finding something nutritious. Agnosticism, or some non-committal and negative attitude of mind, will not suffice to direct the strong forces in human nature. The need which was filled, if badly filled, by religion,

still exists and must be filled.

We need Religion; but not dogmas and creeds, nor yet a mere vague humanitarianism. Something that speaks to heart and intellect, that gives a definite purpose to life, that holds before us a definite goal not limited by the years of this life. All religions have their origin in the One Religion; but the world has

long been familiar with only the remote offspring of the true Religion. People are searching about for the common ground on which all religions meet, but they seek it in compromises and in eliminating points of difference until nothing is left. Thus they arrive at a mere residuum instead of the common origin.

The principles of justice, humanity, and so forth, which are universally recognized to be essential to human welfare, are not based on mere considerations of prudence, political wisdom, or an adjustment of conflicting self-interests. They find their sanction in certain facts pertaining to human nature itself and in the laws pertaining thereto. Justice, to be real and effective, must be more than an abstract principle, it must be a sentiment, an urge. Humanity must be more than a polity, it must be a deep heartfelt feeling. These higher feelings spring from that inner nature which has been so overlaid and stifled by our outer nature. The passions of our outer nature are self-assertive enough, and we yield to them regardless of reason and theories; they can only be adequately met by stronger incentives; mere reason will not do it.

We need a Religion that can inspire men to be noble and self-sacrificing—not for the hope of a future reward in heaven or the fear of a future punishment, but because these qualities are the breath of the true Life. A Religion that can give definite and comprehensible instruction about the mysteries of Man's nature and life and show him how to overcome his limitations and step out into a larger life. A Religion that exhibits death as the temporary deliverance of the Soul from its labors that it may return refreshed to renew them. A Religion that shows brotherhood as a fact in Nature. A Religion that gives knowledge as the consequence and meed of right living. All this Theosophy does.

In short, it is the want of a backbone that has made humanity so flaccid; and that backbone is knowledge.

STUDENT

## ONWARD AND UPWARD

F. J. Dick

DOTH not ceaseless life pervade in silence  
 Infinite space, as even tiniest atom?  
 Do not rolling worlds and starry spheres  
 Have each their special tones of conscious life?  
 Doth cosmic mind enfold this breathing All,  
 Arrayed in myriad unseen shapes, evolved  
 From that out-pouring will whose robe is woven  
 Harmony (source of form and rainbowed light),  
 Whose essence breathes compassion, whose supernal  
 Purpose fashions, paints, and mirrors self  
 In outer Nature, through the seven-fold worlds?  
 (Perchance the shadow-side is touched, where dim  
 Mysterious forms arise, constrained to climb  
 The upward road to full self-conscious life).

And so at length the wondrous being, man,  
 Appears on earth from earlier golden realms—  
 A ray of boundless soul, a son of God—  
 Yet now immeshed in new ascending molds  
 Age-wrought from elemental regions vast,  
 Himself a mystery now to self: half-brute  
 And half-divine is he—the mystic cross.

The royal power is his to choose  
 The path of life immortal here  
 In right of birth divine, or lose  
 His way in fogs of passion drear.  
 The life of beauty, pure and kind,  
 Be ours: not that of fond delights,  
 Destroying senses, dulling mind,  
 Obscuring lofty sunlit heights!

Be ours to seek the high unselfish way  
 That shines from out the universal soul,  
 And lives enshrined within the hearts of all  
 Our fellow-men—within and yet above.  
 So seeking we may pass through many births  
 On earth, and learn through rich experience gained

The cause of human woe, and how to aid,  
 Opposing darkness deep with sword of truth.  
 So battling, heroes earn the help of those  
 Who toil unrecognized from age to age  
 In divers ways to bless, and raise mankind  
 By sure degrees, from shadow back to light.  
 Self-conquered, warriors reach to freedom sweet  
 From wrong, injustice, pain and sorrow—born  
 Of man-made creeds and ignorance dense of law  
 Superb, that "ever moves to good, and knows  
 Nor wrath nor pardon."

Thoughts like these we owe  
 To her, H. P. Blavatsky, who proclaimed  
 The ancient truths of man's stupendous fate,  
 His god-like power and right to rise supreme  
 O'er thralldom dire of sense, and then subdued  
 The subtler still and yet more subtle foes  
 That bar the human soul from heavenly fire,  
 From knowledge, won by those who help the race  
 Through countless ages hardly known of men.  
 Such helpers garner naught for self alone,  
 But lend their aid and strength to all who seek  
 The lowly path ascending toward its source—  
 Untrammelled universal joy and peace.

Already sounds her message o'er the stream  
 Of human life. A mighty soul is here  
 Abiding now, and guiding warrior hosts,  
 Children of light, in whom the soul awakes,  
 And youths and maidens pure and dignified.  
 Yes, princely comrades all, who love the race  
 And live the life of beauty, serving God  
 And man, obeying what is right and true  
 That men may learn and know: the mysteries (taught  
 In ancient days) of man's diviner life  
 Still live, to give new hope to brother-men  
 And prove the knell of selfish thought and fear.

## In the Interests of Knowledge

THAT true science (or true knowledge of nature) and character are indissolubly united, as frequently stated in these pages, is a fact which yet remains for many one of the lost mysteries of antiquity. And it is but a minor presentment of the major proposition that true science and true brotherhood are two aspects of one thing in consciousness.

Let us suppose that an earnest and capable devotee of some modern branch of science, who has given the best years of his life to the subject, should hear of a teacher who had arrived in the world, whether out of some mighty past, or from another more highly evolved planet. That in some manner, whether from intuitive prompting or otherwise, he recognizes in this teacher one who possesses an actual mastery of the phenomena themselves which have been his life-study. That he goes to this teacher seeking instruction.

Can we not picture his amazement and perhaps indignation, when the first thing he is advised to do is never to listen without protest to any evil thing spoken of a worthy brother, and to maintain a constant struggle against his lower nature?

His recognition of that master persisting nevertheless, along with some sincerity of purpose, he may come to believe that this "food for babes" has been tendered him because a certain side of his nature has been neglected and requires attention; and although perhaps remaining a pupil for years, it may never dawn upon him that there is or can be any real relation between ethical principles practically applied and genuine advance in scientific knowledge; and while admitting the improvement in his general character he would possibly be

inclined to say that if there be a direct relation it must be more or less one of sentiment.

Or take a different side of the same question. Suppose another individual recognizes in the same teacher one who is a master both of the mysteries of life and death, and of the true causes of and remedies for human suffering, and that he forthwith enlists in his service as one of many needed co-workers in that field. He too after serving faithfully for years might conceivably be surprised to learn that he is nearing a condition of mind where the truer comprehension of, and a certain mastery in some branches of science (not to mention philosophy or art) will be possible for him. To him also the connexion between true ethics practically applied and scientific knowledge (of nature) may be far from obvious; and being "merely human" he may be equally inclined to regard the connexion as more or less imaginary.

But what is the fact? It is that all the greatest creations in the domains of science, mechanics, art, music, philosophy, statecraft, and literature, have come from men of universal sympathies. None of such moved in the narrow grooves of self-interest, when under the full sway of that which immortalized them. Indeed the fact is so conspicuously obvious, if we glance at the history of the past few thousand years, that it is unnecessary to quote instances. They will occur to anyone. Perhaps a student of Theosophy, who knows something of the past of man through millions of years, would hardly call the work of such men creations, but rather re-presentations, re-discoveries, re-descents, of ancient knowledge in every case, and not remarkably brilliant even then, by comparison. For to the ancients our way of trundling round the world on

wheels and talking across continents by wires or even by etheric explosive waves, would seem childish; just as our philosophies of the unknowable, and the great fore-sightless, and what not, would be like the prattling of babes. Truly the vanity underlying our fine talk of modern progress and scientific achievement, though sometimes sugared with humble agnosticism, is a sure sign of our littleness; emphasized, almost petrified, by the patronizing way we talk and think of the ancients—and anon of our *simian* ancestry. Unfortunately those who so talk and teach are often to be found in charge of educational institutions. And ancient "theology," benignantly named heathenism, is regarded from the same puffed pigmy standpoint by the modern professors of that subject.

Surely if Nature is a Unity, the intelligences and powers and principalities therein who FORMED the man-bearing planets and their life-giving suns, must know more about science and theology than the chimney-pot-hatted respectabilities who talk about heathens and simian ancestors! Granting so much by way of argument—it is surely a more self-evident truth than any postulate Euclid ever conceived—are there no links between these intelligences and ours, no real instructors?

Fortunately there are and always have been. Yet they can not help us—openly at any rate—if we fail to do *our* part. And they are not concerned with the aiding of personalities as such, but with the development of that quality of universality and sympathy which is the outer portal of all true knowledge at once of nature and of self, for these are inseparable. As we rise in knowledge of this wider self so do we near true knowledge of nature, in the broadest sense. STUDENT

### Point Loma

THE Point Loma of San Diego has been made famous in song and story. It is one of the most impressive promontories in the world.

"Like a huge index finger, Point Loma reaches out into the Pacific Ocean. On its extreme tip a beacon light is kept burning for the ships of all nations. It informs the mariner that near at hand is the safest harbor in the world, a port which any ship may safely enter without special guide or pilot. On the inner side of the finger is Fort Rosecrans, standing guard over the mouth of the harbor. Daring indeed would be the man-of-war that would attempt to force an entrance into the placid bosom of the bay beyond.

"Point Loma is about six miles in length. At its tip it measures about half a mile wide, gradually increasing in width until it reaches about two and a half miles. The total area approximates 3500 acres. The southern extremity is owned by the government and is reserved for military and naval purposes. An expenditure of several hundred thousand dollars is now being made for a naval coaling station, and the naval authorities have stated that this is the precursor of the establishment of a government navy yard. On the summit of the government property is the government wireless station, which holds the world's long-distance record for the transmission of wireless messages over land and sea.

"After you cross the boundary of the government possessions you reach the noble buildings and beautiful grounds of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, of which Mrs. Katherine Tingley is the Official Head. Here are the Râja Yoga Academy, the Aryan Memorial Temple of Music and Drama, the open-air Greek Theater, the Point Loma Bungalow and Tent City.

"After you leave the Theosophical Institute, still traveling north, the back of Point Loma broadens out into a beautiful body of land about a mile square, which has been named Point Loma Heights. This property is being prepared by the owners as a site for beautiful homes. Nature has done for it what nature has done for no other place in the world. Among the rich endowments are soil which will grow any tree or plant that will thrive elsewhere in California, an unequalled climate, and at every point of the compass extraordinary panoramic views of ocean and bay, of city and country, of islands and peninsulas, of mountains and valleys. . . .

POINT LOMA AND THE HEADQUARTERS OF THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

"The beauty of the palatial edifices of the Theosophical Center, the wide outlook across the blue Pacific on the one hand, fringed for miles by the glittering surf; and, on the other, far over the calm, sheltered bay of San Diego, past the city, with its brilliant houses shining white in the constant sunshine, and beyond to the distant peaks of the Sierra Madre, and even to the snows on the San Bernardino Mountains and Old Baldy, lift the mind out of the pettiness of common life. In the marvelous climate of the elevated promontory of Point Loma, to breathe is to rejoice, for the rigors of winter and the burning heats of the inland summer are alike unknown. This is

par excellence the Land of the Sun. The sunrise is reflected in the bright waters of the bay, as it gilds the distant peaks, and at eventide the ruddy glow of sunset illuminates the burnished face of the Pacific. It is good to live in such a spot, where the flowers are ever blooming, the birds ever singing, and eternal spring reigns over all.

"It was to this sequestered land of beauty and health, 'far from the madding crowd' and yet not so far as to be out of touch with modern civilization, that Katherine Tingley, that remarkable woman and distinguished philanthropist and teacher, who is the Leader and Official Head of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, moved the International Headquarters of the work, about nine years ago, from New York City. Here she has established, with the help of a body of earnest workers, highly intellectual students of human nature and Theosophy, 'the Science of Life,' an educational Institution which is said, by competent judges, to be one of the most remarkable in the world. In fact, according to expert opinion, there is no system of education known, that can compare, for efficiency in training the heart and mind, with the 'Râja Yoga' systems of Katherine Tingley.

"Besides the education of young people at Point Loma, there are many departments of art, science, and industry, being carried on by students of Katherine Tingley, who are receiving their training as world-workers, under her personal supervision. There is also a large literary and corresponding staff, which produces the 'CENTURY PATH,' many books and other literature, and furnishes the thousands of members of the Theosophical Society throughout the world with practical information and help in the promotion of the principles of Universal Brotherhood and Theosophy.

"The international character of the Point Loma Theosophists—for they come from every state in the Union and numerous foreign countries—keeps this Center in close touch with the branches and outside workers; but, from what we have been told, every department, and all the Râja Yoga schools, have the constant personal supervision of Katherine Tingley. The members of her advisory cabinet, and the other close students, find it impossible to understand how a single person can direct with such marvelous success, the complex and far-reaching activities of this immense humanitarian organization.

"In a visit to Point Loma Homestead, the thoughtful observer is struck by the air of refinement, quiet happiness and joy, and the high moral tone and remarkable intellectual development among the students, both old and young. There are no unsightly backyards nor vacant lots; no hideous advertisements, nor distorted specimens of architecture.

"The Point Loma grounds, which have recently been considerably extended, are laid out with the highest skill of the landscape gardener's art. As well as the beautiful walks, the avenues bordered with graceful palms and pepper trees, and the picturesque flower-gardens, there is a special portion of the estate devoted to the department for training pupils in forestry and horticulture, under the direction of a student, who, before he cast his

lot in Point Loma, was a leading expert in the United States Forestry Department. . . .

"After carefully studying the elaborate and well-built Academy, the Aryan Memorial Temple, and the students' homes, the industrial department, the gardens and orchards, and taking into consideration the amount of intelligent work that has been expended in bringing the whole estate to its present perfection, one of the writer's party, who seemed to be a successful commercial man, and to understand the value of what he was appraising, declared that he thought the estate could be easily bonded for two million dollars. . . ."  
—*Scenic America*

### 'With Courtesy'—Only

MISSIONARIES to China are henceforth to be treated "with courtesy."

Whereby hangs a tale:

In 1899 the Chinese government, to facilitate the work of the Roman missionaries and place them on a dignified footing before the people and officials, gave to the Bishops of that Church the title of Viceroy and to the priests that of Prefect.

But for the usual reasons this presently turned out to be a dangerous concession. It was necessary to limit the power of these "Viceroys" and "Prefects," titles of courtesy and never for a moment intended to confer *political* standing in the private affairs of the country. How would it do to *dilute* these officious (but not official) potentates? What if the Protestant Bishops and missionaries were similarly decorated? It would at least be a delicate hint that *might* be taken.

Alas! these latter met in conference and decided that they

had no wish to complicate their spiritual responsibilities by the assumption of political rights and duties such as had been conceded to the Roman Catholic hierarchy.

So the gloves had to be taken off. The Wai-wu-pu advised the withdrawal of the titles, stating that

Since these regulations came into force the missionaries have been usurping to themselves the insignia of office belonging to the local officials.

The advice has been taken. An Imperial Rescript has withdrawn the titles, and missionaries will now be treated simply "with courtesy and due reference to the treaties."

### An International Observatory

BUILDINGS constituting the Institute of the Col d'Olen, on Monte Rosa, were inaugurated last August. The Queen Mother and King of Italy, and the Governments of France, Germany, Austria-Hungary and the United States, along with many private donors, subscribed to the undertaking. This Observatory, mainly promoted by Professor Mosso, of Turin, and situated on the south slope of Monte Rosa nearly ten thousand feet above sea-level, is for the study of botany, bacteriology, zoology, physiology, terrestrial physics and meteorology. The Institute consists of three stories, having the main laboratories, workshop, etc., on the ground floor, and the rooms for terrestrial physics and meteorology on the second floor. The laboratories cost about twenty-five thousand dollars. This Institute and Observatory constitute a well-organized research station. J.

# Art Music Literature and the Drama

## Ibsen and His Dramatic Interpreter, Mrs. Fiske

**F**OREMOST among playwrights of the day is Henrik Ibsen, who, born in the land of ancient sagas and black winds, of fjord and fell, of rock and skerry, drew his pictures of complex modern life; and foremost among the interpreters of these dramas is Minnie Maddern Fiske, the highest type of actress who has yet arisen from our virile young land, teeming with warmth of life, with luxuriance of color and activity. Moderns of the modern, both of them, expressing the advanced thought and style and art which is developing from the best intellectuality of the age, and which is but a preparation for the art to come, whose appeal will be as far above mere intellectuality as intellectuality is above sensualism. That Mrs. Fiske recognizes today's limitations and tomorrow's dawn is her surest claim to greatness.

The advanced are of necessity in the minority. Ibsen wrote and Mrs. Fiske plays over the heads of the multitude, though the illuminating sparks that fall will sometimes astonish even clod-like minds. Those who take life superficially, to whom a drama is merely an amusement like a light novel, will spend a dull and tedious evening when, for example, in *Rosmersholm*, Mrs. Fiske reveals to us the suffering soul of Rebecca West; but those who have thought and felt deeply, those who have met pain and perhaps despair will recognize in Ibsen and in his greatest interpreter, Mrs. Fiske, two souls who have probed beneath life's surface and who speak to the human heart with understanding and with human sympathy.

One could hardly say that Ibsen is a teacher. It is generally considered that he is a portrait painter, one who neither flatters nor idealizes. The lessons of his dramas we must for ourselves discern as we must find the lessons of life. There before us he puts the men and women of today, stripped of their deceit, their cloaks of conventionality and respectability, and if we can, we may read a great lesson, seeing in them our own foibles, our own disguises and subterfuges. He shows that in our daily life there exists — often latent, perhaps — all of tragedy, of heroism, of experience; that we need not turn to other ages, for here among us, even in the ordinary walks of daily experience, are to be found the elements of great drama. He has chosen to show oftenest, perhaps, the ugly side of human nature, but that he is not a pessimist we may see even in this play of *Rosmersholm* — notwithstanding its gloom and its morbid ending — in the awakening and ennobling of Re-

becca West's nature. And in the final tragedy, consciously or unconsciously, Ibsen has shown by antithesis the weakness of the act. Mrs. Fiske said in her address before the Students of Point Loma that if the audience left the theater feeling the futility of the sacrifice, then the play would have worked for good. Ibsen's plays leave much to be desired, but that which he lacked will come, and in his work he lifted the drama from the plane of the senses and emotions to that of the intellect.

Lomaland Photo. and Engraving Dept.

STATUE OF GUSTAVUS VASA. NORDISKA MUSEET, STOCKHOLM

We believe that Mrs. Fiske sees further to the heart of things than did Henrik Ibsen. Her portrayal of a character, revealing the inmost heart, though with reserve and dignity, with distinction and refinement, bespeak deep experience and deep feeling. We wish for her that the years may find her with increasing power and perception, playing ever greater and greater dramas with ever nobler art.

She has won her present high place by right of merit and deep insight into character, this springing from a wide and sympathetic outlook over life. And only those who have a genuine heart sympathy with others can fully appreciate the refining truth of her art.

A LOMALAND STUDENT

## The Museum of the North, Stockholm

**I**N her Museum of the North Sweden has an institution that is unique. During the last century, when the people were closely linked together by all means of communication, old habits and customs that had been maintained for ages in different provinces were suddenly exposed to a powerful leveling influence and began to vanish rapidly. As many of the usages were valuable links with bygone times and contained much of the poetry that always seems to have existed in the everyday life in the North, there was a real danger that they would be lost before the people had become aware of what treasures they were allowing to slip out of their lives together with antiquated modes.

In Sweden, however, the right man appeared at the right time, devoting his whole life, his great learning and unbounded enthusiasm, to the gigantic task of preserving records of the mode of life of the Scandinavian people during historical time. The beginning was very small thirty-five years ago when Arthur Hazelius started his work, but now, a few years after his death, one of the largest and most monumental buildings of Stockholm, together with the Open Air Museum Skansen, so well known all over the world, cannot harbor all the collections. There is no other country with such a record of the last ten centuries, so complete in the details and arranged with such understanding and real love. What this will mean for the future cannot be overestimated, as it is the total disappearance of the links with older times that has thrown so many nations into intense suffering, when they desired to build something great but only too late awakened to the fact that they had let invaluable materials slip out of their hands.

The Museum of the North is situated in the most beautiful of the natural parks of Stockholm

and the architecture of the building is the so-called Vasa Renaissance. In such interior and exterior surroundings the seat of honor is given to Gustavus Vasa in the form of a mighty statue in a special alcove of the great hall, dominating the whole. He is represented as in his later years, when he had carried out his wonderful life-work of gathering the Swedes together and making them feel as one people with grand common interests, his life-work of placing everything in its right place where it could best serve the country. In his hand he has the state-sword.

A short account of the life of Gustavus Vasa is to be found in Nos. 7 and 8 of the current volume of the CENTURY PATH. STUDENT

### Happiness

**H**APPINESS is a spirit who never comes at command. Though one spend one's life seeking her, and though she be caught on the wing for a moment, yet quickly again she makes her escape. Yet those who turn their backs upon her and decide to shape their lives without her—lo! to them she comes, and with them she abides. But the turn must be made in all honesty. She is a spirit who will brook no coquetting. If we turn but to see if she will follow, her face will never appear. Happiness is what all desire, and naturally—for it belongs to nature to crave her. And most people spend their lives in seeking her, each according to his own idea. Some dig for gold, thinking that she may be hid beneath the ore. Some search for beauty, thinking that there, surely, she must be concealed. Some work for fame, believing that this, once attained, will open the door behind which lives the fair goddess. All feel sure that she will stand revealed to the one who finds an all-absorbing love. But the report from all these different seekers is, sooner or later, but a bitter complaint.

Among some who had reaped disappointment after disappointment, and were tempted to drop all effort in despair, a sudden idea flashed down through the darkness like a light from heaven. It came as a question into the mind. What is the necessity of *my* finding happiness? Is there not a nobler quest? How is it with my numerous fellows who have not yet found this? Do they suffer less than I? Why should I not seek for them? And if, alas! neither they nor I should ever find her, will not the great wheels of time still turn on; will not the great purpose of the universe be nevertheless achieved? What matters it, indeed, if *I* am not happy? Let me do that for which I came. And lo! to these the spirit came, and pervaded the atmosphere in which they dwelt.

And why should these things be? Because

happiness is a universal spirit, and lives in the universal air. Those who seek her in their own little personal atmospheres must seek in vain. She can be found only on that higher level, where there are no separating walls, and where she can be shared by all alike. And in that region she comes without a call.

### ROUEN, IN THE PRISON OF JOAN OF ARC

FLORENCE EARLE COATES

**S**HE laid her head upon the straw,  
She who had crowned a king of France,  
And angel shapes, whom no man saw,  
For her deliverance,  
Knelt at her feet—less pure, less sweet—  
A blessing in each glance.

She laid her head upon the straw,  
She who gave France her liberty,  
And angel shapes, whom no man saw—  
Ah, me! how could men see?—  
Watched till the day, then bore away  
Something the flames set free.—*Selected*

### Allen Raine

**T**HE death is announced from Wales of Allen Raine, the first English-writing Welsh novelist; the first popular interpreter of the inner life of the Welsh people; a woman inspired by the higher patriotism, and one who stood for all that is best in woman's life and in Welsh life.

Allen Raine was seventy years old at her death, although—and this in spite of the long and painful ravages of cancer—very much younger in appearance. All her books have been published during the last twelve years or so; their success was phenomenal from the first, the works of no other living novelist in Britain having ever attained such a circulation. Speculation was of course rife as to the personality of the author; yet that personality remained unknown for years; until lately but few of her readers knew that Allen

Raine was a woman; fewer still knew of her as the quiet "Meistres" of Tresaeth in Aber-teifi, whose time was divided between her novel writing and good works among the fisher folk of the tiny hamlet about her home.

Her books are full of the beauty of West Wales. The waves of Cardigan Bay roll through them; the wind and the rain sweep the beautiful hills; the heather and the gorse bloom and fill her pages with scent and the music of bees; the sun shines

"Over a wild-rose region, rich with flowers,"

and it was Allen Raine who knew how to make the sunshine and the flowers gleam and blossom from her beautiful pages, and how to paint all that was sweet and true, and the gentle poetry of the life of the people. She alone has interpreted the Welsh peasant for the English-speaking world. She knew that poetry and kindness and nature-worship are the stars of the life of these people, and her books went out laden with them, a gift from Wales to the world. That was her great desire and ambition: patriotism drove her to writing, and her own personality was always in the background, her own fame resolutely unsought. She has been accused of painting only the beautiful side of Welsh life, and of leaving untouched the darker side. All life is a duality. The accusation is not true, though she did idealise. "I am not going to wade in the mud," she said, "when so many flowers are blooming on the banks. It is flowers the world needs, not mud." She was ambitious to offer the world a pure bouquet, and she succeeded; she plucked the foxgloves and left the nettles where they grew.

Allen Raine was a bitter opponent of vivisection. Even if the vivisectioners could cure her, she said, she would have none of their cure. Any agony it would be better to suffer than a cure gained from the torture of animals. She was opposed, too, to all creeds and dogmas, finding Deity beneath the stars and on

the hills she loved, and in the service of the people she loved. Whether she gained it from a study of Theosophical literature, or found it, as it is still to be found, a tradition among the mountains of Wales, Allen Raine was a believer in Reincarnation. Just before she died, she heard of the death of an old woman in the village, a cancer victim like herself. "We shall both need a long rest," she said, "before our next life."

Perhaps not. The world has a great need of patriots in these days, Allen Raine. The influence of a life such as yours has been and will be, again and again, who can measure or set bounds to it?

A WELSH STUDENT IN LOMALAND

### No Parents Wanted!

**I**N New York it is difficult for parents with their children to find house accommodation, and the same thing seems to be true of Paris. In the latter city, alarmed by the decreasing birth-rate, they are building blocks of dwellings specially for families with children.

Bless the children! the CENTURY PATH would say; and shame on those who would shift upon their little shoulders blame that does not belong to them. Why not saddle the right horse and put up notices: "No adults *in statu parentis* allowed here!" It is the parent on duty that does the mischief and might justly be shunned by the landlord.

When we see a child behaving like a little barbarian on a railroad car or elsewhere, what is the chief, perhaps the only, but always the insuperable, obstacle to instilling better manners? It is the presence of the parent.

What a topsy-turvy civilization it is! We refuse women many governmental opportunities for which they ask, and we allow them despotic and unrestrained dominion in the very center and at the most sensitive and crucial point of the whole economic system. They, on their side, are quitting the throttle-valve in order to get out and push the engine from behind—or some of them are.

The world is waiting for people who can govern it; but the man is lacking to the opportunity. Any parent, male or female, has an unsurpassable opportunity for practising the art of governing human nature; and if he cannot succeed in this, how can he succeed anywhere else? His influence might begin in the home, but it would rapidly extend until it filled all the time at his disposal. Rulers of men rise to the top like corals and stay there.

It is a school for parents that is needed. And, as there is nobody to play the teacher's rôle in such a school, except people who themselves are actual or potential parents, we must look to Theosophical teachers. They alone have an outside grip on something that is stable and stand on firm ground from which they can lend aid.

Anybody can become a Theosophist if he realizes that that title implies a *character-qualification*. His faith in the Theosophical teachings must be of the kind that inspires

corresponding conduct. Let us study the Theosophical teachings and see if we cannot find therein an inspiration that will raise us to higher ideals of duty and conduct and enable us to attain that self-mastery which alone can render us true guardians of our children. By treating children as future men and women, instead of dolls or sweetmeats, we shall be able to render them blessings that will be sought after, rather than nuisances to be shunned. As to the Râja Yoga children of Lomaland, no landlord who has ever entertained them would not gladly entertain them again if only as an attraction and a credit to his hostelry. That is the invariable experience with Râja Yoga children the world over. H.

COURTOIS' "MADONNA"

### Feeding the Hungry

**D**URING the recent hard times, the pathetic condition in our cities has become even more pathetic.

In New York many children have gone hungry to school. It is reported that many of them have fainted from exhaustion. As so many of them have been obliged to start the day without breakfasts, a number of philanthropic people have organized a Children's Relief Society, which furnishes them with necessary food.

We feel grateful to those who are alleviating suffering of whatever kind. It is a horror that our civilization has so many sores of this nature to be dressed. Side by side with all the pomp and splendor in the cities, are always these pictures of abject misery, of cruel want, of degradation, vice and crime. How much has been done to stay this human waste,

and notwithstanding the enormous amount of suffering that has been temporarily relieved, still the picture of horror grows blacker and the figures which tell of those in an inferno of suffering run up. The means used so far have failed to lessen the evil.

The UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY has been criticised at times because it is not oftener engaged in patching up and draining out these sores of nature. But the organization is too busy, at present, *arresting the causes* which have produced the present condition. At times, under immediate need, it has shown itself well able to meet such emergencies, *but it is economy of effort to leave this work in the main to those qualified to do it, and to spend its energies in the field which has yet been left untouched.* Many have yearned to work this field but have not had the knowledge or power. It has been left to the Leaders of this Movement to see clearly the disease eating at the heart of humanity, and to find the way to remove it. Enough people must be so changed in mind and heart that they will have the power to leaven the mentality of the whole world. Enough must learn the true art of living to be able to produce a contagion of the right sort, which will spread everywhere. And to produce such a herculean result, we will have to begin with the children. It is the Râja Yoga Schools which are one of the hopes of the world—a promise of better things. The day is coming when all will bless those who have instituted and guided these. STUDENT

### Jottings and Doings

(From a Student's Note Book)

**D**URING a recent storm on the Atlantic coast twenty lives were saved, under the most trying circumstances, by a group of society men and women whose main object in life had heretofore been to seek selfish pleasures. They were enjoying an automobile party when Captain Hedges of the Life Saving Station near by appealed to them to help him save the crew of the stranded *Chipewa*, then being beaten to pieces at some distance from shore. The whole party responded valiantly, and men and women

together worked, drenched to the skin and in many cases with torn and bleeding hands, under the Captain's directions, until the cable of the breeches buoy had brought safely to shore the last soul of that crew of twenty men. Then these society women, disregarding their escorts' suggestions that they seek shelter and, if possible, find some dry clothes to replace their wet ones, turned to their picnic-baskets and from the contents soon served to these exhausted men, with their own hands, food and steaming delicious coffee.

After all possible service had been rendered, these society folk returned to their automobiles, bundled themselves in as comfortably and dryly as might be, and whirled back to the city, declaring that they had had the most glorious time of their lives! Here is proof that humanity is divine, that compassion is not dead in the hearts of men, but only sleeping.

### About Pearls

**T**HE pearl has been a source of interest and delight to the people of all ages, and a wealth of legend, poetry, and romance surrounds its origin and the part it has played in the destiny of men and nations.

The ancients, who greatly prized the gem for its wonderful lustrous beauty, were much puzzled to account for its formation within the mussel's shell. Of the myths that have come down to us, the most common, perhaps, was the belief that drops of dew fell into the shell when open and were transformed by some power of the animal into pearls. In India the legend runs that when the moon shone on the sea, the mussel, filled with wonder, came to the surface of the water, and the tears of the gods, weeping for lost souls, fell into the open shell and there hardened into pearls. The association of pearls with tears doubtless originated with this legend.

At this day, even, it is not certainly known how the pearl is formed. The general belief is that a parasite or particle of foreign substance works into the shell and irritates the tender flesh of the little animal. In self-defense he covers the offending matter with layers of the fluid secretion which nature provides for lining the shell, and in this way the pearl is gradually formed.

The Chinese discovered this fact centuries ago and used the knowledge. They would

### ENERGY

George Croly

**E**ARTH'S rough yet noblest spell is—Energy!  
Mind's hammer, hatchet, plough! the stern-faced dun,

That makes us pay our debt to man—or die!

Never to halt, until the race is run,—

To know no weariness; no danger shun;

Until Time's hand has struck the crowning hour,—

To think that nothing's done, till all is done,—

Through day and night, through sunshine and through shower,

To fight the gallant fight! — Resolve, itself, is power!

—Selected

keep a quantity of pearl-mussels in a tank and, opening the shells, insert tiny images of the Buddha. In the course of a few months the mussel had covered these images with the pearl fluid. It has long been a practice in several countries thus to increase the yield of pearls by inserting round pieces of lead or mother-of-pearl.

In earliest times the most famous pearls were found on the coast of Ceylon where the pearl-oyster measured from nine inches to a foot in diameter, but now pearls as fine are found in many parts of the world. The most perfect pearl in existence is said to be in the Zosima Museum at Moscow, and the largest, measuring four and one-half inches in circumference, may be seen at the South Kensington Museum, London. STUDENT

### Facts Worth Knowing

FIFTY THOUSAND young trees prepared by the Forestry Department in Vermont, U. S. A., are to be planted this year in that state. The trees are red and white pines.

IN Lund, Sweden, there is a museum, one department of which illustrates rural life. There may be seen old peasant houses, a church, an inn, the interiors arranged so as to show just what life in the country is like. There are even figures standing about dressed in the national costumes. In Prague, Bohemia, is a larger museum of the same sort.

THE instruments used in making weather observations were invented by Italians. In 1450 Nicolas de Cusa invented the hygrometer by which the relative humidity of the atmosphere is measured. In 1578 Egnatio Dante invented the anemometer; in 1595 Galileo, the thermometer; in 1639 Cartelli, the rain gauge; in 1643 Torricelli, the barometer.

IN the sacred ceremonies of the Hindû religion the conch shell is used, though it is not known what significance is attached to the use of it. A conch with spirals twisting to the right is regarded as especially precious, worth its weight in gold, in fact, as £4000, the price paid for a conch of this kind in the city of Calcutta, seems to indicate.

# THE CHILDREN'S HOUR

## HEIMDALL

Augusta Larned

IN the Elder Edda I read it,  
That volume of wonder lore,  
How Heimdall, a god of credit,  
Was watchman at Heaven's door.

The sight of his eye was keenest  
Of all in Asgard's towers,  
For he saw, when earth was greenest,  
Pale Autumn amid the flowers.

His ear was the best at hearing  
Of all above or below;  
When the Spring-time's step was nearing,  
He heard the grasses grow.

He heard the talk of the fishes  
Deep down in the silent sea,  
And even the unbreathed wishes  
Of chick in its shell heard he.

He heard the feathers growing,  
And wool on the old sheep's back,  
And even the light cloud snowing  
Far off on the sunbeam's track.

He knew what birds are thinking,  
That brood o'er the crowded nest,  
E'er their fledgling's eyes are blinking,  
And the song is warm in the breast.

And why were his senses keener  
Than all in that magic clime,  
Than Odin, and Thor, and Haenir,  
And Baldur of Asenheim?

I think—it is only guessing—  
Heimdall was loving as wise,  
And Nature who bent in blessing,  
Anointed his ears and eyes.

And should we but love undoubting,  
Perchance, ah! who can tell?—  
We might hear the corn-blade sprouting,  
And the tiny leaf-bud swell.—*Selected*

## Work in Modelling at the Râja Yoga Academy, Pinar del Rio, Cuba

ONE of the classes which the children at the Râja Yoga Academy in Pinar del Rio like best is their modelling class. The boy or girl who knows nothing of this branch of art cannot imagine how much may be gained by the study of it.

By digging down a few feet in the patio of the Academy in Pinar del Rio one can get very good clay both white and colored, to use for modelling. Before it can be used it has to be cleaned and refined. This process is very interesting and some of the boys love to help to turn out the smooth, soft clay.

At first the children thought it would be a very easy matter to take a piece of clay and model it into the form desired; but they soon found what close observation and what great perseverance are needed to get good results. In beginning a model, especially if it is hollow like a vase, the student must work with great care. How often have the boys and girls in Pinar del Rio seen their work tumble down when almost completed. It reminded them of King Robert Bruce of Scotland who tried so many times and failed. Some, however, followed Bruce's example and tried until they succeeded, and it is their work which you see in the illustrations.

Lomaland Photo. and Engraving Dept.

## ORIGINAL DESIGNS OF POTTERY

MODELLED BY THE CHILDREN OF THE RÂJA YOGA ACADEMY, PINAR DEL RIO, CUBA

This spring when they were making vases, the pupils studied about the origin of pottery. In copying some of the old Greek and Egyptian vases they found that these ancient peoples not only combined beauty and utility, but at the same time taught a great moral lesson. In the strange figures painted on the vases they found depicted the same battles which have to be fought and won today.

The little tots love to model. All last winter they modelled from objects and imaginary things. They have linen aprons to wear when at this work. It is a beautiful sight to see them all standing around the long table molding the clay with their plump little hands. When the class was over it was very interesting to look at their work. There were bananas, sweet potatoes, bird's nests, oranges, elephants, chickens, kittens, etc. Some were very good and some were very funny.

But this spring when they saw the older children making vases for the exhibition they wished to make one also. So they all began to work. The very smallest tots made the coils and the older ones built the vase. It was very large, almost as large as the smallest child. But it was well made. They painted it a beautiful dull green color and then they were asked what design they wished to put on it. They thought for some moments and then one said: "The Midnight March," "Yes, yes! si, si!" they all cried, "where the animals march round two by two." This is the name of one of their action songs about the animals in the Noah's Ark who march every night at twelve o'clock. But the teacher ex-

plained that although the vase was large, they could not possibly draw all the animals on it; but that they might choose three. So they chose rabbits, kittens, and chickens. They had drawn these many times in their classes and could do them very well. The visitors who came to the exhibition were more interested in this vase than in any other thing. Can you see it in the picture? A.

## A Dog's Obedience

NOT long ago in Kansas City some people noticed a dog running up a terrace and then sliding down on his back, only to do the same thing over and over again. The people wondered why the dog was doing this, for he seemed to go about it in a business-like way and not just for fun. They must have been surprised when they found out what made him do it. He was following the doctor's advice! When he was a puppy one of his forelegs was broken. It was carefully attended to by a physician, bound up in splints, etc. The dog learned to hold the injured leg up for the doctor to look at, and seemed very grateful to him. One day the doctor said: "Now Jack, if you want your leg to get well you must use it, you must take some exercise." It was after this that the dog began to run and slide on the terrace. Don't you think Jack deserves to have his leg get quite strong? G.

In Japan there is to be seen a hollow tree trunk 65 feet in circumference, inside which is growing another tree, now 9 feet in circumference. The inner tree is 110 years old.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis

Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

## Weismann's Biological Ideas

WEISMANN'S theory sums itself up in the phrase, "The Continuity of the Germ-Plasm." It is claimed to be an established fact that the individuals of the lowest forms of life are "immortal." This idea has been applied to the higher organisms, including man, a part of whose body is immortal, being handed down from generation to generation.

Studying an amoeba under the microscope, we find that this animal consists of a single cell. In the cell is the nucleus, and in the nucleus is the nucleolus. When the animal reproduces itself, the nucleus divides and each half withdraws to an opposite side of the cell. The cell then constricts in the middle and divides into two. Thus there are two amoebae. The same process goes on in more complex organisms, but the new cells do not float away but remain together in a mass. All organic matter is seen to be composed of such a mass of cells which have sprung from a single cell by division. An egg is a simple cell, made large by the addition of food-stuff; it divides and subdivides, until there are billions of cells, enough to form every part of the future chick.

It is necessary to account for differences among these cells, for they are not all alike, they vary infinitely. For this purpose, and also to explain what it is that causes the cells to divide at all, Weismann analyses the cell further partly by actual microscopical examination and partly by conjecture, until he arrives at an element which divides itself into two *unlike* parts. This is sufficient to start the differentiation: for, having got A and B, we can get AAB and ABB, and so on indefinitely.

But it is not all the cells that so differentiate themselves indefinitely. There are a few whose function it is to remain the same, and together these constitute the germ-plasm which is transmitted from generation to generation and preserves the species while allowing of differentiation in individuals.

These discoveries are very interesting and important, and they bear out the statement of H. P. Blavatsky that biology

was one of the twin magicians of the coming time, chemistry being the other. This process of the one begetting the two, from whence proceed numbers and infinite differentiation, is the very process described in the highest ancient philosophical teachings as that by which the universe is generated from the primordial unity.

As above so below, is a very ancient maxim of Occultism; and here we see the microscope revealing in the smallest cells the same process as attends the birth of worlds and the differentiation of cosmic Mind and Matter from the Unity that precedes them. "Number and numbers lie at the root of all manifestation"; the Pythagoreans and Platonists realized the truth of all this.

But modern science scarcely knows what to make of its discoveries. We are told that Weismann is an epoch-making discoverer whose ideas will have more effect on social and political history than all the soldiers and statesmen in the world put together. The

ideas of Darwin are supposed to have had such an influence, though he had no idea that his "struggle for life" would be expanded into a "struggle for existence." Many will, however, be inclined to doubt the far-reaching effect of Darwin's views on the social and political world. At all events, such influence as they have had has been rather of the iconoclastic kind, breaking up old modes of thought, preparing the way for new, but not establishing anything permanent. They taught us to look for order and system in the works of the Universal Spirit, instead of arbitrary dispensations of the theological kind. But when some thinkers went so far as to try to deduce from Darwin's ideas a law for the government of human polity, they merely set up a temporary superstition associated with somewhat discouraging views as to the ends and possibilities of life, and destined soon to melt away in the more genial light of that hope that springs eternal in the human breast. For not all thinkers are biologists; nor do men of science exercise such an unrestricted sway in the actual world we live in as they do in that more ideal world in which they spend a part of their own lives.

But little consistent with the idea that Darwin's thoughts were such an influence in the world, is the next idea that is put forward — namely, that Weismann has swept about one-half of Darwin's ideas into the scrap-heap. If epoch-making discoveries are to succeed one another so rapidly, one is inevitably filled with qualms as to what may befall Weismann in his turn. Ere the world has had time to frame its social and political economy anew and develop a new system of ethics on the lines of Weismann's latest discoveries in biology, Weismann himself may have emulated Darwin's rapid descent from the pedestal to the paper-basket, and we may be called upon to contemplate

A Building for its Tenant's Needs: not the Opposite

A Progressive Revelation of "Design"

plate the discoveries of still another biologist with still another message for the world.

Needless to say we cannot change our ideas of human life, polity, and ethics, every time a fresh landmark in microscopical discovery is reached.

The extraordinary thing about this kind of biological philosophy is that it proceeds in an entirely one-sided way.

It concerns itself only with the world of visible effects, leaving out causes altogether. Surely it is a very wonderful fact that a cell should divide; nor does it become less wonderful when we analyse the cell into centrosomes, rods, and chromatin. Is it enough to know merely that the cell does divide and subdivide in such a manner? What kind of a human polity or system of ethics can we base on that mere fact? As to heredity, we may have some new ideas as to the mechanism thereof, but the cause is as inscrutable as ever.

But we can learn a good deal from these facts by looking at them in a more intelligent way. For instance, there is the idea that in man (as in other beings) there is a permanent element which does not die but passes untouched from generation to generation. Does not this show us that in a new-born child, we have a comparatively clean sheet on which we may write what we like, and that the evils so often attributed to heredity may be largely due to after-influences? We

are rid thereby of a certain fatalism which besets the people who attach too much importance to heredity, and this seems to be in a vague way the idea which the advocates of Weismann have in contrasting him with Darwin.

But then this Germ-Plasm! It is surely but little short of Almighty God himself, so potent and dominant is it in the conduct of cosmic evolution. Deep thinkers can never rest satisfied with the single fact that there is a germ-plasm that does these things; they will want to know what that germ-plasm is *in itself*, or what actuates and inspires it. To answer questions like this, we must get beyond the *What* into the *Who*. We can never reach finality in *Whats*; there must be a *Who* at the bottom of things.

The microscope reveals cosmic substance as it emerges into the plane of visibility—from whence? Give us the atom or the cell and we will soon build you up a visible universe of matter and create an elephant out of a tadpole. But you must first give us the atom or the cell. And what a gift!

Great as have been the various conceptions of almighty power, they have never even touched the power we see exercised by these omnipotent cells and atoms. We may well say, "God is an atom"!

It is an absolute fact that *every time a man thinks a thought, he creates and destroys swarms of cells*. His body is a fluid ocean of cells, being born, dying, changing, reproducing themselves, every second of time; the whole influenced either by his present thoughts and emotions or by thoughts and emotions which have become habitual and "automatic," and have passed into the stage known as "vital processes." Here, then, in man's mind we find

a something that is prior to the cells and atoms, having to them a causal relation.

The whole crux of the philosophy is that we must rely upon our *will*. If we regard ourselves as so much irresponsible mechanism at the mercy of the apparently inexplicable actions of the cells that compose our bodies, to what mysterious power do we yield ourselves up? We yield ourselves to that which actuates

the cells, the semi-intelligent powers that govern the operations of nature in its lower kingdoms. Thus we become the slaves of instincts, inertia, passion, attraction, and repulsion. The attractions and affinities of the cells are felt in our minds as impulses and instincts; our (instinctual) minds are built up of rudiments as our bodies are compact of cells.

But right here comes the tug between animalistic theories and spiritual ones. In man there is something which sets aside and overrules the whole animal mechanism. For however much the lower mind of man may be involved with his vital processes, the higher, directing, discriminating mind which makes him what he is—the mind which plays the leading part in the imagining of these very biological theories—is independent. And it is this higher mind that plays the chief part in human polity and morals. If man is to be an animal, then why not be content to be ruled by the laws that prevail in the animal kingdom and are sufficient thereunto? But if he is more than an animal, then he

needs higher laws than those based on biological facts—or catastrophe is inevitable.

And, as man's passions are infinitely intensified by their association with his reason, so he needs a correspondingly superior power to keep them in control. His reason must link itself with his spiritual nature and aspire to the laws that govern the spiritual planes of Cosmos.

So, while these microscopical studies are interesting and helpful, let us never forget that the real world wherein we live, the world that counts, is the world of our own consciousness. The life which we have to live, *volens nolens*, is the life of mind and aspiration and thought; the relations that interest us most are our relations with each other. Let us study the field of our own mind and heart as the biologist studies the field of view in his microscope; and investigate the forces that rule therein.

There may be a material basis for the forces of the animal mind; but there is no material cause for the aspirations and incentives of our higher nature, nor is it possible to formulate any mathematical or mechanical system of representation corresponding with them. The material on which the higher mind acts is the lower mind; and that again acts on matter. We cannot study the higher mind objectively; we study it from within; not on the field of chemical reactions but in that of motive.

STUDENT

### Theosophy and Sport

THE recent celebration of the Olympic Games in England gives occasion to call attention to the significance of this modern revival of an ancient institution. We are looking towards the ancients in everything

now. The churches have not disdained to consult the old minute-books of eternal Religion in search of inspiration for their future proceedings. Literature and art have always regarded themselves indebted to antiquity. Science is rapidly coming to a point which will enable it to recognize the truth of many of the ancient ideas, especially those relating to the sentience of Nature. Archaeology is continually digging up the fossil remains of what were deemed modern inventions. And now it is sport. History books may prate about the superstitious notions of the Greeks in imagining that athletic sports were acceptable to the gods; but sportsmen, as we see, have not scorned to copy the Greeks.

The spirit of fraternity was the basis of ancient games; they brought together separate peoples in a friendly rivalry. The purpose was to manifest the glory of a certain essential part of human nature—the physical part; and to exhibit manly prowess so far as pertains to the body. At one time intellectual and artistic competitions were included. It should be the pride of man to exhibit his prowess, not only in matters spiritual and mental and artistic, but in matters physical. For physical culture, beauty, and perfection, form one of the three branches of education, the other two being the education of the intellect, and that of the faculties called forth by the arts and aspirations.

The British showed true sportsmanlike feeling in their rejoicing over the victories of the Americans and their sympathy with the Italian who was defeated by a stroke of ill-luck in the Marathon race. National emulation plays no part except as a healthy spur to effort; the victor is honored because he is the victor. The national suspicions which we are so fond of airing in the newspapers we support, were all ignored at this meeting of magnificent specimens of manhood from all the nations.

Those old gods in whose honor the ancient games were celebrated are not dead yet. They have survived all attempts to supplant them with weak sentimental gods or captious martinet gods. When their spirit breaks out in humanity, it sweeps aside all the unhealthy schisms and phantasies, and humanity becomes humanity once more. Let us hope these games will retain their healthy spontaneity and not suffer themselves to be "cornered" by the managing spirit and turned into an "institution." Will the Olympic Games ever be opened by an archbishop? Let us hope not.

Many of our modern cults and cranks have sprung up like funguses from a decaying foundation and could not exist in a healthy soil. We owe much to sport, in spite of its frequent abuses, for counteracting opposite tendencies that might have destroyed our civilization. The healthy athletic spirit needs to be kept alive in these days of nervous diseases and maudlin cults of all kinds.

But let us keep animalism out of it. The gladiator and the prize-fighter are not the ideal; the ancient Greeks had other ideals. Many of their greatest geniuses were also distinguished for physical prowess. Because a man is athletic, he need not therefore despise other kinds of culture and be slovenly in his upper stories. And a man may be ever so smart in a physical sense and still a slave in other intellectual and moral senses. H. T. E.

# Some Views on XXth Century Problems

## Civilization by Hypnotism

TO the *North American Review* Mr. H. Addington Bruce contributes an article on our increasing insanity—to be more respectful, on our increasing number of insane. (Nevertheless a people that is *producing* more of the insane is also *becoming* more insane.) Mr. Bruce says:

Not long ago the United States Census Bureau issued a report which should have provoked instant and wide-spread discussion, [since it revealed] the existence of conditions making strongly against the continued prosperity of the United States and its continued progress to headship among the nations.

The report showed that in 1880 the asylum population was 40,000; in 1890 it was 74,000; in 1903 it was 150,000. Mr. Bruce goes on:

It is futile to say, with many an eminent alienist, that this is the price that must be paid for civilization—futile, because a civilization that would sap the vitality of mankind could never hope to prove an enduring fact.

By “futile” he means illogical; the price would prevent the delivery of the article. There are apparently two alternatives: either we can have our kind of civilization at a less price; or we can try some other kind. We can tune the people to what there is; or we can have something to which they can comfortably stay tuned.

But civilization is not something apart from, and around, the people; it is a condition of the people themselves, of each one of them. The alternatives therefore are: to alter the individual's mind so that he can remain sane whilst pursuing his present mode of life; or to alter the mode of life.

Mr. Bruce supports the first of the two; we are to tune up the individual so that he can go on doing what he is now doing.

There is a good deal of altruism in men; but taking them as a whole, taking civilization as a whole, is not the profound keynote of its activities, the mainspring of its economy, the principle that each should *take* as much as he honestly can and *give* as little? The tension that is now everywhere driving the weakest—in body, ability, or mental sanity—to the wall, the wall of poverty, failure, insanity and suicide, is the result of the operation of this principle. The article seems therefore to argue that the principle is unalterable, is in fact the due and proper principle of a civilization; and the remedy for the insanity-part of its results is all that we can seek.

It then goes on to suggest very correctly that there are latent powers in the mind, that recent researches “point to the presence in the human organism of faculties transcending those of which man avails himself in his commerce with his fellows.” The argument is now that if these can be brought out, man can learn to tolerate his own civilization:

Already the psychical researcher . . . has made bold to declare that the human self is a much more complex and unstable affair than is generally sup-

posed—that, indeed, the self of which man is normally conscious is but a self within a larger self, of which he only becomes aware in moments of inspiration, exaltation, or crisis.

This larger self is to be invoked by hypnotism! by “psycho-pathology”! The “psycho-pathologist”

has taken defective children, and enlarged their powers to an unexpected degree; he has taken vicious boys and girls, and developed them into useful men and women; he has taken the victims of liquor and drugs, and saved them when all else had failed to save them.

All these, restored by hypnotism to the rank of worthy members of society, will, says the article, hand on their worthiness to their children in the normal course of heredity.

So the argument really comes to this: That man can be made *tolerant* of that vicious principle in his own nature which has created his civilization, by *evoking his higher and diviner self!* the evocation being effected by hypnotism!

First, we ask for the production of some useful men and women developed by hypnotism from vicious boys and girls; and second, for the production of a man or woman *permanently* cured of the drug or alcohol habits by the same means. We deny that hypnotism under any alias can evoke or touch the higher self, and assert that any seeming benefits which may result are due to temporary *inhibition of the tendencies of the lower self*, are negative therefore, and over the area of consciousness affected have produced an automatism in place of the proper spontaneity. This automatism corresponds with a more or less permanent injury; but if ever it is partially recovered from, the original tendency for which the operation was perpetrated, will reappear. It is moreover untrue that any seeming benefit produced by hypnotism is transmissible by heredity.

We assert further that there is nothing which hypnotism may *seem* to do for the betterment of a child which may not be *really* done by education; that education, by those who know their work, may *really* invoke the higher self; and that the benefit is then permanent and immeasurably far-reaching. Any child not susceptible to the influences of the real sort of education by the real sort of educators—and few such children there are—is also absolutely out of the reach of hypnotism and requires a special kind of treatment for which society as yet hardly provides any facilities.

And lastly; when education of the kind we refer to shall be generally known and practised, education such as is pursued at Katherine Tingley's “Râja Yoga” schools, the second of the two alternatives will have brought itself about; civilization will have altered its keynote; men will take thought for and of their community in all they do; and all the sources of pain and disease will have begun to vanish. The sentiment of altruism will have proved itself as potent a stimulus to strong action as selfishness and ambition. STUDENT

## Cities Edgeways

THE architect of the Singer building has worked out a sketch plan of the highest structure which the New York official regulations would permit. On a rock foundation, says the *Scientific American*, the permitted weight is 15 tons to the square foot. A surface with a 200 foot side may therefore support a building of 600,000 tons. How high could such a building reach? The walls of the upper 75 feet of it must be 12 inches thick. For each 60 feet below that, they must have an additional thickness of 4 inches. The architect's calculations say that under these regulations a building 2000 feet high is possible. From a heavy wind-gale the structure would be exposed to an over-turning moment of 6,000,000 foot-tons; but it would have a stability of nearly nine times that amount.

Apart from any question of the validity of the calculations, of land-movements, of earthquakes, and the unforeseen generally, and assuming that such structures will gradually be approximated to, and arise over considerable city areas until something happens—what about the people who dwell, if only for a number of hours a day, below? For such buildings constitute cañon-makers. In the depths of the cañons a million people crawl about. What of their health? They will be breathing air laden with human emanations, air which is practically never changed save by slow diffusion.

But we know the turn of the balance when dollars are in one scale-pan and human health and life in the other.

It will be safe enough to predict for some not very distant future a disaster which will stop this method of enlarging cities by building them on their edges. STUDENT

## Our Progress

IT appears that we are twice as literary, twice as thoughtful, twice as cultured, as we were nine years ago. Is not a nation's progress in all these things to be measured by its reading? Very well; what is read is read from paper, and we produce about twice as much paper—made by the massacre of the number of trees necessary to produce four million cords of wood—as we did nine years ago. We would only suggest that paterfamilias, when he has had his breakfast, put his feet on the table, and spent the morning reading all the massed columns of his journal, should occupy the remaining ten minutes before dinner in asking himself what department of his mind or character has gained one fraction of growth from that much reading; what valuable and practically applicable thing he has learned. If he can think of something real gained and learned, let him try to imagine a morning journal which should give him that same something less oceanically diluted with trash and poison. That bit of meditation will be valuable enough to him to undo a good deal of the harm he has done himself.

But picture that beautiful tree, now ignominiously spread out thin into *The Sunday Wallower*, sixty four pages! STUDENT

## GENERAL VIEW OF KANDY, CEYLON, SHOWING THE BEAUTIFUL LAKE

### Kandy

KANDY is 74 miles by rail northeast of Colombo, and 1665 feet above the sea. Lying in a deep basin in the hills, it is surrounded by a district of wonderful beauty. Here, and in the picturesque pass through which the railway now winds, the Sinhalese made their last stand against foreign aggression. The Portuguese, who landed in Ceylon in the year 1552, and the Dutch by whom they were ousted about a century later, both made unsuccessful attempts to capture this mountain stronghold; but it was not until after 1796, when the British drove out the Dutch, that the stoutly defended pass was taken and held, and the Kandyan capital at length fell into the hands of Europeans. V. B.

### The Unicorn

IN treating of the Unicorn, writers have mixed up symbology and natural history in a remarkable way. When a unicorn is represented as a heraldic device and in connexion with the legend that it can be captured only with the aid of a virgin, it is clear our ancestors never dreamed they would be followed by a race of people who would take this literally. Such a heraldic unicorn is conventionalized into a horse or ass with a single twisted horn, just as *leo heraldicus* is conventionalized into a kind of leonine dachshund with a tail twice as long as his body.

What language was used by ancient mystic science to denote the various powers and faculties of

the inner man which the candidate for knowledge had to study and learn to employ? We ourselves have analysed in a vague and confused way some of the functions of the mind and emotions, and we denote them by abstract terms such as "will," "memory," "attention." Of the higher faculties we do not even know. The best symbols that could be found for these higher faculties were animal symbols, as we find in the Egyptian animal-headed "gods," and in the various kinds of sphinx.

The symbolic unicorn denotes spiritual wisdom, as the lion denotes courage. Nevertheless symbolic animals are not entirely imaginary. Dragons are derived from monsters now extinct, but known to earlier races of men; and the unicorn has several originals in natural history. *Der Umschau* (quoted in *Scientific American Supplement*) gives illustrations and descriptions of Nepaul sheep with one, two, three or four horns. The one-horned kind has the horn curved backwards. These are not distinct species, the variability in number of horns being transmitted in the one species, but no particular variation being transmitted—a fact which "bids defiance to the current theory of mutation." Not a bit! the theory only needs to make itself one degree more current and it will serve until the next new fact comes along.

Abbé Huc describes a Tibetan unicorn, which is, however, an antelope. He says that it really exists and is much represented in sculptures and paintings. He quotes from Klaproth to the following effect:

"The unicorn of Tibet is called, in the language of this country, serou; in Mongol, kere; and in Chinese, tou-kio-cheou: which means the one-horned animal. . . . The Mongols sometimes confound the unicorn with the rhinoceros [The rhinoceros horn is not a true horn on the skull but a wart on the skin. The rhinoceros is an Eastern symbol of pachydermatous selfishness; his horn is a make-believe.] . . . The Chinese, Mahometan and Mongolian historians agree in the following tradition, relative to a fact which took place in 1224, when Chinggis Khan was preparing to attack Hindūstan.

"This conqueror having subdued Tibet, set out to penetrate into Enedkek (India). As he was ascending Mount Jadanaring, he perceived a wild beast approaching him, of the species called serou, which has but one horn on the top of the head. The beast knelt thrice before the monarch, as if to show him respect. Every one being astonished at this event, the monarch exclaimed: 'The Empire of Hindūstan is, they say, the birthplace of the majestic Buddhas and the Bodhisattvas, and also of the powerful Bog-das or princes of antiquity. What then can be the meaning of this dumb animal saluting me like a human being?'"

This shows the symbolical character of the animal. Besides the sheep and the antelope, there is a one-horned ox, whose recent fossil remains are found in Palestine, though no one-horned ox exists in that country at the present day. STUDENT

# ✻ The Trend of Twentieth Century Science ✻

## The Conscious Ether

IN an address delivered early this year on the ether, and lately reprinted, a noted English physicist makes one quotation, and one remark of his own, which if followed further in their suggestion, might lead to some understanding of that ever perplexing "nominative of the verb to undulate." His quotation is from Clerk Maxwell:

Whether this vast homogeneous expanse of isotropic matter (the ether) is fitted not only to be a medium of physical interaction between distant bodies, and to fulfil other physical functions of which, perhaps, we have as yet no conception, but also . . . to constitute the material organism of beings exercising functions of life and mind as high or higher than ours are at present—is a question far transcending the limits of physical speculation.

His own remark is:

We know that matter has a psychical significance, since it can constitute *brain*, which links together the physical and psychical worlds. If anyone thinks that the ether, with all its massiveness and energy, has probably no psychical significance, I find myself unable to agree with him.

In our own bodies, sensation lies as it were in immediate contact with the ether. The ether, whether lying in and between atoms and electrons, or in and between stars and planets, is the medium through which all force is transmitted. When my finger is touched with a needle, a wave passes along the ether in and between the molecules of the arm nerves until it reaches the ether in the brain, and then immediately slips into my *consciousness*, becoming there a sensation. After a moment it re-becomes an etheric current and runs down again to the arm muscles.

Physics has translated matter into ether, and the undulations and waves in ether constitute currents. Having thus gotten rid of "matter" we find our problem still containing two elements, the ether and sensational consciousness. How does the one transmit to the other?

How if they are identical? Then my sensational consciousness is but my bit or share of the universal ocean of sensational consciousness around. The etheric sea is a consciousness; material units are points of active life therein. The laws of matter and electricity become the laws of cosmic consciousness in its productive working within itself.

Well, what then? We have a hypothesis which, if true, is of extraordinary importance. It is not out of harmony with any known fact. It correlates with, and is the only explanation of the known facts of our reception of sensation. If it is not obviously and probably untrue for external nature—and it is not—its possible truth is eminently worth examination. For while, in so doing, we need not get away from or blink any known physical law whatever, we have, if the hypothesis is correct, an inner door through our own consciousness leading in to the inner workings of nature. We can watch phenomena from both sides, from without as objective occurrences, and from within.

The possibility of higher (subjective also)

ethers, corresponding to the higher-than-sensational parts of our own consciousness, would be considered later. Finally science and philosophy would blend. Which is surely an end worth working for, an end that would bring peace to many a troubled and searching mind. For all the troubles of humanity lie in the artificial separation of science and philosophy and of both from religion.

STUDENT

## But Never the Moon!

THE preconception of the scientific observer is sometimes so strong that it gets into the very words he uses to describe his experiments. There is a tree growing in Porto Rico, the *Carica papaya*, which is dioecious—that is, each individual tree produces flowers of one sex only. According to the natives, if at the new of the moon the terminal bud be cut off, the tree will change its sex, producing pistillate for staminate flowers, and *vice versa*. An instance of the fact of change, following an injury to the terminal bud, happened under the notice of a scientific observer. On inquiry among the natives he learned their theory as to the influence of the moon.

For some reason or other, scientific men object very much to the influence of the moon upon either vegetable or animal life, perhaps even more than they object to maternal influence in the causation of prenatal marks. So far as possible they avoid the subject of the Palolo worm, which strictly follows the lunar instead of the solar cycle in its procreative changes.

The bias comes out somewhat amusingly in the report about this curious tree which the observer makes to the columns of *Science*.

On observing this peculiarity [that of the change of sex] investigations were begun to find the cause.

The first of these was the inquiry among the natives, resulting as we have said.

Other trees growing on the grounds were at once set aside for experimental purposes, and the tops were removed at different phases of the moon to disprove the moon's having any effect [not, observe, to *find out* if it had any, but to *disprove* it!] and also to show, if possible, what were the necessary conditions, if any, outside of the mere removal of the terminal bud.

He reports that there is some other condition involved. Now come a few curious sentences.

The moon's phase does not appear to have any control [the reader will now expect some statements showing the basis of the "does not appear." But the sentence goes on] though, strange to say, those treated at a fairly definitely recurring period are the ones that show change.

The reader will now expect to be shown that this "fairly definitely recurring period" does not co-ordinate with the lunar month, since "the moon's phase does not appear to have any control." But the report goes on:

It is possible that the plant has definite short cyclic periods of growth and that it is necessary to remove the tip at some definite phase of this cycle in order to produce the development of fertile

flowers. If this be true and this cycle should accidentally coincide fairly well with the moon's phases, the belief in moon influence would naturally arise.

So it is *pre-determined* that the coincidence would be "accidental"! And the last sentence shows, in spite of the misleading previous ones, that the "fairly definitely recurring period" has *not* been ascertained to be not identical with the lunar cycle.

It is not often that the cat jumps from the bag so visibly. But perhaps the layman was not supposed to read the report. STUDENT

## A Mineral "Serum"

TO read nowadays a medical advocacy of a non-animal preventive remedy for an infectious fever is rather refreshing. An opportunity of this kind was given us early this year in *The North American Review* by Dr. Leach, who has made a special study of Yellow Fever and of the medicinal use of arsenic for its prevention and minimization. His figures seem to be decisive.

In 1905 there was an outbreak of Yellow Fever in New Orleans. The authorities adopted every possible measure; and the public were not only taught the rules of hygiene by daily lectures, but were compelled to carry them out. In addition, the effective destruction of the mosquito, the germ-carrier for this Fever, was provided for by drainage, screening of cisterns, and the use of kerosene films. In spite of all, the epidemic increased until on one day in August there were 105 new cases. A few days previously, Dr. Leach, whose advocacy of arsenization was known, was requested to come to the city and educate the people in his theory. Within a very little while enough arsenic tablets had been sold to saturate—for the purposes of this disease—165,000 individuals, leaving 95,000. The article states that of the latter group 3391 took the Fever and 448 died. Of the former group there were but *five* cases, all mild. Arsenization became general, and the epidemic disappeared. Dr. Leach summarizes that whilst "the destruction of mosquitos is but a partial protection," since it can only be partially carried out, "arsenization is practically a complete preventive of the contagion, and an absolute preventive of fatality."

The article does not give the necessary daily dose, nor the number of days requisite for its continuance. The former would depend on individual idiosyncrasy, and the superintendence of a physician would of course be eminently desirable.

But more than anything, the article gives a suggestion towards the preventive treatment of other epidemic fevers. It appears that there are means other than the injection of animal extracts, for arousing the resistance of the blood, for inducing it to do its duty in respect of opsonins, antitoxins and the rest. If arsenic is to Yellow Fever what copper is to Cholera, what of the other epidemic invasions? Can they not be analogously met? Perhaps the plague-stricken natives of India would submit to a preventive treatment which was not unclean, were one forthcoming. M. D.

## An Educated Horse in the Greek Theater, Point Loma

ON Friday, June 13, the pupils of the Rāja Yoga Academy and some of the students at the Headquarters of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, Point Loma, California, had the opportunity of seeing a private exhibition of the remarkable powers of probably the most mentally accomplished member of the equine race living, "King Pharoah" the educated horse, property of Dr. Boyd, his trainer.

The performance took place in the arena of the beautiful Greek Theater and was carefully followed by hundreds of keen eyes. The animal, a graceful piebald horse of medium size, was not accustomed to showing off his accomplishments in the open air, being used to tents; and the unusual surroundings and the light breeze that was blowing all seemed to interfere a little with his power of concentration. But notwithstanding this handicap the results of his efforts were truly surprising. It seems incredible that a horse should be able to add up two rows of three figures correctly, and pick out the answer, figure by figure, from a row of numbers hanging on a convenient rack; yet so, to all appearance, he did. The numbers were given by various children in the audience and written upon the blackboard, which the horse carefully studied before walking across to the rack and picking out the right figures. When given two numbers to add or simple words, orally, he easily found the letters or figures needed; and when called upon by voices in the audience as well as by his master to pick out a cloth of a certain color from a number of variously colored pieces he never made a mistake. He also carried pieces of cloth or other articles designated orally or by writing on the blackboard to the place desired. He showed, in short, conclusive evidence of unique development of perceptive faculties and apparently of the thinking ability which is claimed for him, and which must have been evoked by the utmost patience and skill on the part of Dr. Boyd, to whom the students and children owe many thanks for his trouble in giving the performance, for which he would not accept any payment.

Such an unusual case of animal intelligence instantly brings forward several "explanations" which more or less satisfactorily explain. Firstly, of course, there is the simple theory of confederacy by signalling to the horse when to stop. The hypothesis of *unconscious* signalling has also to be considered; there is the possibility of thought-transference, and finally, the idea that the animal does really possess the rudiments of mental powers.

The signalling theory seemed to be out of the question in the majority of the tricks, not only because signs were not perceived by the watchers (for in certain undoubted cases of signalling to trained animals which are on record the signs given were so slight that they could only be detected by the use of specially

contrived instruments) but from the method of procedure adopted by the horse when picking out the letters, numbers or colors. That is to say, the animal did not slowly and deliberately move along in front of the rack and check himself when he arrived at the proper place, but went straight over to the thing he wanted from whatever spot he may have been standing at the time he decided to obey the order. Sometimes he was obviously not paying attention to the matter in hand, but admiring the scenery or trying to investigate the qualities of some loose hay, but as soon as he did decide to perform there was no hesitation. He went directly to the right place and took the right thing; nor could he have been stopped by sign or otherwise, while experi-

Director of the Berlin Zoological Gardens said it was proved that there were no unfair methods nor *intentional* signs used, but that the horse had "learned to read the answer from his instructor's or questioner's face; by quite small movements, to most people imperceptible, of the person standing before him, to recognize when he must stop stamping . . . the horse remains a phenomenon . . . an incredibly fine thought-reader among horses such as had not previously been dreamed of."

The learned naturalist calls this *thought-reading*! What would he have called the performance of the beautiful animal we have just had the pleasure of seeing at Lomaland! For there was certainly nothing in any of his feats of skill which could be explained by the

Lomaland Photo. and Engraving Dept.

## SEAL ROCK, SAN FRANCISCO

menting dubiously with the various things, when he came to the right one, because he had evidently made up his mind from the first as to which he intended to take. He knew when red was called that it was the red cloth that was required, and when 6 and 7 were given he picked out 13 without dwelling at all upon the rest of the numbers.

To the scientific students in the audience this was the most striking feature of the exhibition, and seems quite to remove it from the possibility of the explanation given of the arithmetical feats of "Clever Hans," the Russian horse whose doings were so exhaustively investigated at Berlin by an independent committee of experts a couple of years ago. Hans gave answers by stamping with his hoof until the right number was reached, and the questions were in some cases only *thought*, not spoken, and not only thought by his trainer but by the investigators. The scientific

above simple principle. Why should it not be a case of real thought-reading? Surely we have nearly all met genuine instances of this on the part of some of our intelligent dogs. Dr. W. J. Hudson gives several undoubted instances in his works on psychology. The fact is, the scientific world knows so little of even human consciousness, and still less, of course, of animal, that a "masterly inactivity" in theorizing and a greater energy in collecting facts, however unlikely, would be more befitting the present state of ignorance. But upon the conditions of human consciousness, and even of the consciousness of the lower kingdoms of being, Theosophy can throw an illumination nowhere else to be found. Animals can develop a degree of intelligence corresponding to their necessities; but this we accept unquestioningly, because it is familiar, calling it instinct. What this horse did was only less usual than what animals habitually do. C. J. R.

## DREAM-LIFE

(from the Swedish of Viktor Rydberg, the bard of Lake Vättern)

**N**OW the more that you feel how the chords of the soul

may harmoniously thrill to the wood's solemn tone, like a lake that reflects heaven's stars as they roll will your heart mirror forth the eternal alone, and your life be enthralled by the light in its play as if echoed from spheres wherein melody streams: of the great dreaming All, an intelligent ray which perceives that creation of God ever dreams.

When you follow some clear brawling brook in career, or you wait near a waterfall foaming in might, you will see and revere immortality here in the whirl of the leaves as they swirl in the light; or when moonbeams are glancing on billowy waves, in the silvery glamor from shore unto shore you behold in your fancy the radiance that paves the way hence from decay to eternity's door.

See the meadows now heaving in flow'ry array and the white fleecy mist softly floating along: ah then hearken the whispering chorus so gay of the spirits of ages that glide there in song! Yet a shadow arises, a trembling of soul of the deepest the heart of the cycles has known: 'tis of woe and compassionate pleading, the whole that the harps of the seers have sounded and shown.

Hear it murmur: the myst'ry in combat and pain is the way of perfection that souls ever plan, and the impress of woe we see Nature sustain is her longing to build yet more royally—Man. Yea the harmony felt is a longing profound: for in Nature abideth the wish that men all shall transform dream-life's vaguely melodious sound to a wakened, a freed, and a joyful chorale.

Lo then Nature adorned with gay flow'rs as a bride, the renewal of all things in symbol displayed, and see why in the springtime she tries in her pride the attire she will wear when all strife has been stayed. 'Tis the promise divine, brightest hope of the free, that suffuses the sky with the colors of joy, lifts the sap in the flower, the bud and the tree, and gives roses on cheeks to the girl and the boy.

'Tis from man's inmost soul nature's laws have their sway:

when we purer regard the creation's full trend, in the ambient ether a clearer new day from the blue empyrean will surely descend; and when bards ring the chords to a grander refrain, richer, beautiful splendor in earth-life will shine and the higher the far-reaching thought will attain; see, more boldly expanding the regions divine.

F. J. D.

## Remorse

**A**S the old idea of a ceaseless, raging hell fire began to fade out of the theology of this Christian era, the idea of a hell of remorse crept into its place, which seemed to satisfy even better the bloodthirsty element in the minds of the originators of theology. And well it might, for all who have suffered from this (and God pity the one who has not), know that the most vivid imagination could not evoke a more perfect hell. Only the instigators of this compassionateless theology, made

of it a sealed leaden covering for the soul; a useless waste of torture; a stunting and destructive process.

Not being emissaries of the Light, they could not bring it, and they omitted to show that every sincere emotion has two aspects: one that liberates, and one that binds. The Angel or the Demon within are behind each and every thought or feeling experienced. All must be tried by fire, it is true, but there is a fire which consumes and destroys, and another which purifies and refines. One is fanned by the Angel and one by the Demon. So it is with remorse. And how shall we know who is fanning the flame?

If with the biting pain comes a regret that *we* have lost a place; that *we* have been left alone; that *we* have lost a chance; or that *we* have been humiliated, there is the Demon on guard. If there comes the temptation to drop the effort and die; if the fight seems hopeless; if the heavy pall of discouragement envelops us, then indeed is the Demon at work. But if with the ache at the heart, comes a pang that others have suffered; a distress that time has been wasted; an unutterable longing to repair; a consciousness of the mighty needs and a sorrow to have failed in one's part to answer, then is the Angel's voice heard through the storm of anguish. If with the stifling pain, surges up fresh courage to do one's best, be it little, be it much, and therein to be content; to make of the past a strength and not a weakness; to hold to the higher purpose—then is the presence of the Angel made known; and, mystery of mysteries, deepest and holiest secret of all time, the god-like power to choose which force shall rule, lies within each one—the proof of man's divinity.

Whatever may have been the fault, however deep-reaching the sin, his voice can rise above remorse and say: Let not discouragement bring fresh cause for sorrow. Let this lesson at least be learned. STUDENT

## Some of the Teachings of the Wisdom-Religion

**W**HAT does this grand old philosophy say to us? It tells us of the most marvelous facts relating to universes and worlds, among myriads of which is our little earth which we so overestimate in rank and importance. It tells us, not that they were created out of nothing, but that they were and are now being evolved out of primordial matter, and that they periodically and in accordance with cyclic law, appear, have their life term, then disappear or die, returning to Nature's storehouse as matter to be again employed in the ceaseless round of creation or evolution. This teaching is the only logical and reasonable explanation of Nature's methods as working in that department, and it may be to a degree corroborated by our little knowledge of facts as gained by our limited observation.

But what more vitally concerns us here and now is the teaching that we are souls, not newly created at the time of our birth into this life, but that we have always lived and always shall live, and that all of us being equal and pure descended into material life to gain the knowledge and experience necessary to fit us as perfect beings for the final purpose of our existence; that we, the present humanity,

have reached our status of today by experience gained in the lower kingdoms of nature until, by the aid of more advanced beings, combined with our own efforts, we have become what we now are—human beings with a mind, with self-consciousness and free will to mark out our own career within the circle of necessity, or the limitations of law.

Although we are to work out our salvation individually, yet this cannot be accomplished save through our efforts to benefit collective humanity. Just as the branches and leaves of a tree have each their own work to do, but always for the benefit of the tree, from which they cannot be separated without death to themselves, so we have each our work to do; but we doom ourselves to destruction if we endeavor to separate ourselves from humanity as a whole. We are all living in the one ocean of life, breathing the same air and our bodies made up of physical particles from the same storehouse of nature. Still further, our souls are all sparks from the One Great Soul, our minds parts of the one great universal Mind and we are so united, so interdependent that we cannot possibly separate ourselves from our fellows.

To realize and live up to such a grand teaching as this would end our sorrows and miseries. This unity or brotherhood of all humanity which we have lost sight of in our strivings for self, is a fact in nature. We are ignorant of the laws of our being, the transgression of which brings about all our woes.

Karma, or the law of cause and effect so elucidated by Theosophy, together with the law of Reincarnation, amply responds to our needs in the daily guidance of our lives.

What could be more just and merciful than reaping what we sow? If our thoughts and acts are good and unselfish we reap from them the deserved happiness. If they are selfish and bad we reap from them a suffering which is a lesson intended to teach us wherein we have erred. Still further, what could be more just and merciful than giving us ample time and opportunity to learn the law and profit by our experiences in a return again and again into material life, the arena of our struggles and failures and the only school in which we can learn those lessons whose books are closed to us during our periods of rest in a more spiritual condition between earth-lives.

If we accepted this true philosophy of life and were willing to make all possible effort to live in accordance with it we should find that we would here and now gain that happiness which we are so vainly seeking by false and lawless methods. We would not have to wait for that everlasting heavenly happiness so illogically promised us as a reward for our short one-life term of good or, perhaps for the most part, evil deeds.

Although happiness would not be our aim if we were working for the good of others, yet it would rightfully come to us. What could give us more joy than to be in the possession of a philosophy of life whose absolute truth we were daily and hourly proving by putting into practice its teaching, by lessening the woes of the world around us, all of which arise from a lack of the sense of human unity? Theosophy is not dogmatic. The Sun of Truth shines for all just as the natural sun gives light to all. It needs simply that we shall open our hearts to recognize its truth. M. J. B.

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** What has Theosophy to offer the practical modern world, and how can it be proven to be true?

**Answer** II. "Practical" forsooth! This huge, wasteful life-squandering farce-tragedy—where did we learn to call it practical? Men and women by millions made of no account; their possibilities never allowed to come in sight of actuality; their stars set without ever having risen; souls flung away in the search for dollars; minds rioted out over endless newspaper paragraphs, cheap literature which gives them no food, no culture, no nourishment—only excitement: innumerable cities built, which for lack of patience and practical wisdom, must all be built over again in the next few years; mentalities without the least conservation of energy, frittered away in passion, in gossip, in flippant imaginings—Good God! where is the practical part of modern life?

In Theosophy you will find the beginnings of it, and this is what Theosophy has to offer, first and foremost. The practical man, you will concede, is the one who gets most accomplished with the least expense of energy. He has his workmen at their several tasks, and will have no one wandering about aimlessly or hindering the others. He insists upon order, and will have every man at his own work. Such a standard we have set up for outward and commercial observance, leaving the real world at chaos. We have organized matters where individual pursuit of money is concerned; but in national matters, and in the economy of mind and spirit how do we stand? Is there any practical life there?

Man is one company, and whatever a man has of good within him, he owes it to the world. Every human being is a diamond mine, so to say, which ought to be developed; because of this kind of diamond humanity stands desperately in need; there has always been a famine of them, by which millions have perished. Deep borings and shafts ought to be made, skilled labor ought to be employed, and the best machinery. Instead, what have we but a desolation of wild beasts and a few wandering blacks, who will maybe scratch the soil here and there with their assegais, for any glittering charm near enough to the surface?

Watch the rout of thoughts trickling through your mind—unconnected, insignificant, valueless; coming from nowhere and leading to nothing. Is it possible that all that motion represents no energy? Energy it is, and you do not know its whence nor whither; you are not conscious of its fountain within you, nor of the place where it escapes from your control. So during all the moments when your work has loosened hold of your mind, energy is breaking loose and running to waste, which might have opened up unknown rich regions within you. Ophirs and Golcondas, realms that should have filled your life with delight and compassion, have remained undiscovered, because with all your boasting there is nothing really practical about you.

A kingdom divided against itself cannot stand; that is the first principle of practical wisdom the world over. Yet the Human

Kingdom is miserably divided against itself; and it does *not* stand yet, either; it has not learned the art of standing. You would have thought a "practical" world would have seen the force of finding means to arrange matters so that nations and classes and individuals should be each in his proper place, and no one setting fingers in pies not his own, or hindering the work of a neighbor. One need not inveigh—the facts are too patent altogether. There is nothing practical about the world today—not even money-making, which is the blackest and most ruinous form of idealism, the basic laws of life being so opposite to it. We are in such a hurry to get rich that we have no time to consider whether our labor is really creative of wealth, or not. Mostly it brings in a kind of imaginary increment, which represents nothing, since it has no value to humanity at large. We build railways, bridges, houses, that are going to kill human beings, because of our fool's haste and greed; or even if there is no murder in them, they must be pulled down in a few years and rebuilt—and all because we have no true ideas of economy, cannot go deep enough into ourselves to find out the place where permanency can be imagined and worked out.

But Theosophy shows the infinite patience of things, and how the universe and the sum of all forces is pitted against you, and *will* have good work from you, wait it a thousand years to wear down your crass insistence upon fooling. You will shirk will you? Will do work with hurt for some one in it? Well, you shall be kept there, you shall not budge till you have learned better. Discomforts are to rain upon you; those who only see from without will have little idea of your burden. Go on! The Law can wait, since it is universal; you shall retrieve all this, it may be promised you. Irresistible forces shall drag you back to it a million times; no human being can imagine such patience as is against you. Fool's work is all this of doing wrong; antics which are not amusing; spiting one's face in the usual manner. Religion has covered up this teaching for its own convenience's sake, substituting many novel and ingenious ideas without relation to life, and so we have grown in unpracticalness and live in a world of dreams, mainly bad dreams. Our houses are all built on the sand, and well below high tide mark. Theosophy, suggesting that there is good reason for their being perpetually washed away, is narrowly questioned as to its practicality.

How can it be proven true? The senses will only tell you the appearance of things, not their reality; and you can have no direct knowledge except of your own self, which commonly we know least of all. It follows that no proposition under the sun could ever be proven, unless it were one that belonged to the inner self of a man; then it could be proven by and for him. Also, that within oneself is the first place where one must go to find knowledge. Yet the field of one's own experience is too limited; we can speak of thoughts and feelings and desires within us which are not ourself, and of one central light which we perceive too dimly, which is Self. But we need some greater field of experience to give meaning and direction to this of our own immediate perception, and must become able to correlate with it the experience of hu-

manity; enlarging our consciousness so as to embrace the vision of mankind, of which we should only sense ourselves as a part. That is to say, seek truth and the answer to all queries for the world's sake, and that you may throw yourself in with those who are working for the world, and you shall find it in the experience of your days, all events answering some question. The divinity in man will become directly known; it is seen in the great Helpers; it is felt in some measure whenever an effort is made to help; and so all the grand truths of life sail up from beyond the horizon of the mind, and are seen and examined. We should hardly mention the word "proof" except with misgivings. There is evidence on the one hand, and direct knowledge on the other—but it is doubtful if there is anything between. E. P.

**INQUIRER.** . . . Can you tell me, then, what has caused this system of Theosophy which you support to arouse so much interest and so much animosity at the same time?

**THEOSOPHIST.** There are several reasons for it, I believe. Among other causes that may be mentioned are: (1) The great reaction from the crassly materialistic theories now prevalent among scientific teachers. (2) General dissatisfaction with the artificial theology of the various Christian Churches and the number of daily increasing and conflicting sects. (3) An ever-growing perception of the fact that the creeds which are so obviously self- and mutually contradictory *can not be true*, and that claims which are unverified *can not be real*. This natural distrust of conventional religions is only strengthened by their complete failure to preserve morals and to purify society and the masses. (4) A conviction on the part of many, and *knowledge* by the few, that there must be somewhere a philosophical and religious system which shall be scientific and not merely speculative. (5) Finally, perhaps, a belief that such a system must be sought for in teachings far antedating any modern faith.

**INQ.** But how did this system come to be put forward just now?

**THEO.** Just because the time was found to be ripe—a fact shown by the determined effort of so many earnest students to reach *the truth*, at whatever cost and wherever it may be concealed. Seeing this, its custodians permitted that some portions at least of that truth should be proclaimed. Had the formation of the Theosophical Society been postponed a few years longer, one half of the civilized nations would have become by this time rank materialists, and the other half anthropomorphists and phenomenologists.

**INQ.** Are we to regard Theosophy in any way as a revelation?

**THEO.** In no way whatever, not even in the sense of a new and direct disclosure from some higher, supernatural, or, at least, *superhuman beings*; but only in the sense of an "unveiling" of old—very old—truths to minds hitherto ignorant of them—ignorant even of the existence and preservation of any such archaic knowledge. . . It is essentially the philosophy of those who suffer, and have lost all hope of being helped out of the mire by any other means.—H. P. Blavatsky, in *The Key to Theosophy*

# THE UNIVERSAL BROTHERHOOD AND THE OSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## 'Let Us As Warriors Stand'

THIS refers to the War of the Ages, of which all others are but symbols when righteous, or perversions when unrighteous. Like Solomon's Temple of old, which was built without sound of hammer, this can be waged in the silence without sword or bomb. The foes slain in this warfare are those real and subtle enemies, the instigators of all false wars, the causes of all woe and ignorance. Not only those strong in muscle and physical endurance may engage in it. Women are called as well as men. Even a child may enter its cause. In the living book in which are written the names of the conscripts for this vast army, will be found every soul. Sooner or later in this eternal strife all must engage.

What does it mean to stand as a warrior in the mighty cause, in which he who wins is "greater than he who taketh a city"? Only those who have entered it can guess its meaning. Only those who have triumphed can know it in truth. For it means to resist evil every moment; not only to meet the overt outward attacks, but to resist those subtler foes within one's own citadel, who lead off one's soul from the issues of life. It means to stand sentinel over one's thoughts, to hold with a will of iron to the true view-point; to ward off discouragement; to avoid ill-will; to maintain patience; to shun like poison all desires to supersede others, to gain advantage—be it with money, with fame, or preferment. It means that when one has fallen (as all must, times without number), to have the fortitude to disregard the painful stab of the enemy, and rise to one's feet undaunted.

It must also mean a contentment, a willingness to accept heroically those circumstances which try the soul—for only the soul who has been tried by fire can hope to overcome. It means indeed to keep the Star of Golden Purpose ever in sight.

And then indeed will follow a growth in discrimination. The great souls, those who have overcome, recognize the foe, though he be fair to look upon and clothed in noble sentiments and heralded by those in power. No coverings of good intention, of brilliant gifts; no proffered service, can hide from them the subtle threads of evil which enter and destroy. And their power gained in overcoming will

## MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

then withstand all popular prejudice, all habits of thought, and will point out the Way to the Pilgrims who pass. STUDENT

## Stagnelius, A Swedish Theosophical Pioneer

A HUNDRED years ago a poet who called himself Theosophical lived in Sweden. This was Erik Johan Stagnelius, who was born in 1793 and died in 1823 in his thirtieth year. Though his life was so short, he has written some of the very pearls of Swedish poetry, and is regarded as perhaps the most gifted of all poets in the North.

Stagnelius seems to have had a very clear insight into the workings of the Great Law, and often sings of how all Nature is waiting for Man to free himself and thus to free the lower creation also.

In his preface to *Lilies in Saron*, Theosophical poems as he calls them, he says:

Let not the word "Theosophical" frighten anyone. Theosophy is the substance of a religious view of the world-life, dressed in different colors in different individuals, but always originating from one and the same intellectual light. It is not difficult to find in what it differs from theology. Theology is a systematically arranged statement of the contents of the written Word, conceived merely as a thing of memory. Theosophy on the contrary is the living intuitive conception of the Divine Word, where-soever it may manifest itself, in writing, in Nature, in contemplation of the Self—conceived by the heart or the imagination or, it may be, a still higher faculty.

In another place he says:

The ancient world had a knowledge of God, Nature, and Man, in comparison with which our modern farthings-worth of wisdom is nothing. This knowledge is unquestionably a result of Divine revelation. It was first transmitted by verbal tradition, and later on, when this could no longer be used, by secret orders and a symbolic ritual. . . . In all the chronicles and works of genius of ancient races preserved to our day may be found, though but rarely, fragments of the original culture. Only by the light of the Divine torch of genius can they be

traced among the ruins. . . .

In the light of what has been said, only genius and virtue have the right to constitute a church, because they alone have Divine authority; and the priests of this church must be regarded as named by God, anointed by the Holy Ghost. Hence this church cannot be realized until genius and virtue have had time to conquer the many-headed hydra of dullness and egotism. The result must neces-

sarily be a hierarchy, though in the highest and Divine meaning of that word. The lower must be subordinate to the Higher; on no other conditions is a real humanity possible on this earth.

In the night-cycles of human races light comes only in fitful and isolated gleams. Yet these lone beacons serve to keep alive the memory of daylight. By his single efforts, against the antagonism and inertia of the mass, no man can do more than thus light his beacon and forge his link in the chain of testimony. To bear single and solitary witness to the Truth amid the general darkness means martyrdom in one form or another. The frail physique, with its uncongenial ancestry and nurture, stands not the strain; and a weakness which should be succored is mocked until the pilgrim falls by the way, leaving only his reputation to the mercies of his critics.

Collective effort is needed if the light is to shine unfailingly and for all. In place of a few isolated individuals whose intuition is awake, we must have groups, fellowships. Then the sun of genius will no more go down before its times, but the great souls will be protected and the light handed on. STUDENT

## The Four Elements

THE wise ancients spoke of four elements—earth, air, water, and fire—and were careful to imply that each of the four is alive and sentient. The enlightened moderns are hesitating between a hundred elements and one only, with the careful qualification that it or they are dead, inert, and purely mechanical. And we moderns are so deficient in humor that we do not yet perceive how the concepts, living earth, living air, living water, and living fire, cover a far wider range of mechanical, vital, and conscious phenomena in realms solid, gaseous, liquid, and etheric, than any generalization modern science has reached. Nor do we suspect the ancients of having subdivided each of the four living elements, including the etheric fires, into seven times seven active potencies. F.

### Ancient American History

IT is important to distinguish Science itself from all the various changelings that may pass under its name; and it is a chivalrous duty to defend exponents of true Science against any who may be exploiting their reputation.

There is a certain influence in the world which has treated Science in the same way as it has treated Religion—turned it away from its true purpose and made it the servant of bigotry and retrogression. In short there can be such a thing as *scientific Churches*, with dogmas necessary to salvation.

True Science ascertains facts before proceeding to theories, and is always ready to modify its provisional theories in the light of additional facts. The other kind of science has fixed theories which have to be respected, and if anyone brings forward facts repugnant to these theories he is not welcomed.

Among scientific dogmas is one which it has really derived from theology—the dogma that the human race must in fact be recent upon the globe.

The most wonderful thing Science has done for our present civilization is to open its childish eyes to the fact that the world is both larger and older than we had surmised in our infancy. We learn from geology that world-history, as we have known it, represents but one leaf out of a library of many *volumes*. In every series of sedimentary deposits we descry the files of past history, age upon age, bound into volumes and sets. Our own history represents but the topmost layer. The whole recognized history, in fact, is included in the term "Recent Times"; times so brief that no perceptible changes have taken place in the evolution of life-forms.

And we have only to turn to astronomy to realize that as in time, so in space, the confines of the universe are infinite, and that our world bulks as a pin's head.

In violent and absurd contrast with these expanded views, we still cling to the old narrow theological ideas about the human race, priding ourselves, perhaps, on having added a millennium or two to the Biblical dates. And this *in spite of the facts*.

American archaeology is collecting facts. These facts refuse to lend themselves to the existing theories. It was a great blow to orthodox ideas when the Europeans came over here and found decaying civilizations. Where had the Americans come from? It never occurred to people that they could possibly have come from anywhere else but the Old World. But science will not allow that there has been any migration within historical times; and also

adds that the life-history of America, human and otherwise, shows signs of having pursued an independent line of evolution unmodified by influences from elsewhere. Yet on the other hand the indications of unity of origin between the peoples of the Old World and the New are too many and striking to be ignored. The only solution of the question is to suppose that that community of origin dates from a far older time than science has been willing to admit; and that, though the civilization of America has been isolated throughout all historical periods, it originally came from a source common to that of the Old World.

We find here a continent whose history lies in the past. It flourished ages ago, reached its zenith and declined; and now it is beginning to be peopled again.

The world profited much by the discovery of the classics of Greece and Rome. Again by the deciphering of the Egyptian hieroglyphics. Again by the translation of Hindû and other Eastern literature. The revelation of the history of ancient America still lies in the future. It would be useless for the world to know more when it is so tardy in assimilating that which it already knows. When we do know it, it will be as surprising as the earlier discoveries were, in its revelation of the existence of highly cultured civilizations so far removed in place, time, and character from those we have been accustomed to. An enthusiasm for tracing the evidences of man's long obscured divine destiny is needed; and when that is reached, the clews in *The Secret Doctrine* will be gladly followed. STUDENT

### What Next?

A MISSION WORKER EXPECTS TO CONVERT ALL ENGLISH-SPEAKING PEOPLE

ROME, July 31.—The Rev. A. P. Doyle, rector of the Apostolic Mission House, in Washington, has informed the Vatican of the progress made by the mission in America. The object of the mission is to convert Americans to the Catholic faith, and Father Doyle says that it will not take long to realize this project. The hope is entertained that the entire English speaking people will be converted to Catholicism.—*Kansas City Times*, Aug. 1, 1908

### In the Lion's Skin

BEADS and rosaries have been used by Buddhist monks for over 2300 years. . . . The title of "nun" is an Egyptian word, and had with them the actual meaning; the Christians did not even take the trouble of translating the word *Nonna*. . . . In the Caves of Ellora may be seen the figure of Indra's wife sitting with her infant sun-god, pointing the finger to heaven with the same gesture as the Italian Madonna and child. In *Pagan and Christian Symbolism* (Inman) the author gives a picture from a medieval woodcut—the like of which we have seen by dozens in old psalters—in which the Virgin Mary, with her infant, is represented as the Queen of Heaven on the crescent moon. . . . "Than this, nothing could more completely identify the Christian mother and child with Isis and Horus, Venus, Juno, and a host of other Pagan goddesses, who have been called 'Queen of Heaven,' 'Queen of the Universe,' 'Mother of God,' 'Spouse of God,' 'the Celestial Virgin,' 'the Heavenly Peace-Maker,' etc." . . . And so above, below, outside and inside, the Christian Church, in the priestly garments, and the religious rites, we recognize the stamp of exoteric heathenism.—H. P. Blavatsky in *Isis Unveiled*, vol ii, pp. 95, 96.

### Hints for Those Seeking Truth

DEAN Stanley describes one great effort of his life as trying to do "Something to break the collision between the beliefs and doubts of the age, and to fix our gaze on the hills from whence cometh our help."

Herbert Spencer says: "Amid the mysteries which become more mysterious, there will remain the one absolute certainty that man is ever in presence of an Infinite and Eternal Energy from which all things proceed."

Theosophy declares the importance of utilizing that great energy for man's spiritual unfoldment. Acknowledging this Infinite Life, it listens to its voice, and urges man to ascend therein to the heights of spiritual effort, that he may discern the difference in human life between what is and what might be.

To study the Universe by the Light of Theosophy; to aim for action, not speculation; to train the human mind to broaden its vision, and move out from the conflict of delusion, is my urge. Man, without knowledge of his divinity—of his true place in the great Universal Scheme of life—knows not his possibilities, nor can he realize what are his obligations.

Man, to live a natural, honorable, serviceable, happy life, must work, as I have so often said, in consonance with the divine energy that enwraps his being; else all is confusion and darkness in his life. So Theosophy pleads with man to study himself, to challenge his highest mental faculties and search for Light; to search for the root of delusion, as well as truth. Understanding causes, he will be better able to interpret effects, and to discriminate between the false and the true.

Realizing that opportunities are with us today that may not be ours tomorrow, we must grasp the immediate present, and prepare ourselves for a deep research into the records of the ages. Close application to the study of Ancient Teachings that have their root in times thousands of years before the Bible was written, will both illuminate and broaden the mind. But to equip oneself for such a path of effort, the mind must set aside prejudice, misconception, and doubt.

Seek the Kingdom of Heaven with a heart attuned to the love of knowledge, and, if need be, storm the fortresses of error and dogmatism along the way; but remember that the motive in this action must be pure, and based upon a love of justice for all humanity.

One seeking for the Eternal Truths should determinedly protest against any effort tending to divert the mind from the path chosen. Yes; equip the mind with knowledge; and, with that superb mental strength that comes from an honest purpose, be prepared always to meet the strenuous efforts of the subtle foes of Truth.

Instead of trying to make Theosophy fit into some of the popular teachings and notions that you have hugged to your heart (while doubt was in your *mind*), set them aside, while you refresh yourselves in contemplation of the Infinite Laws guiding man's life.

Would efforts in this direction limit a man's mental capacity, or interfere with his real progress in life? Should man be encouraged to ignore the eternal verities simply because it requires mental application to find them, some moral courage to endorse them, and more, to *live* them?

What a libel it is upon the dignity and faculties of the human mind for certain self-styled teachers of today and yesterday to assert that man must find his way in blind faith alone! That to study the great chronology of the past, and the hidden truths therein, will result in damnation!! Theosophy opposes delusion, and dogmatism is delusion. Is it not believable that great errors have been made in modern readings of ancient history, particularly in obscuring ancient truths, and in deifying the sayings and work of many who have had no real place in promoting the progress of humanity?

Theosophy declares that if the simple truths of Jesus Christ, and of the many great teachers who preceded him, far, far back in the ages, had been *understood*, and lived, there would be today no records of warfare carried on in the name of religion; no dissension in God's great family.

In spite of the accentuated spirit of dogmatism that we see in human life today, TRUTH LIVES!!—and Theosophy is plowing its way into the hearts of the world's few who love Truth better than they love life, and who are ready to lay down their lives for a just cause. Theosophy is a superb, altruistic effort to lift the veil that hides the Light, that obscures Truth,—to free the mind of man from cruel bondage. One must never lose sight of the fact that Truth is today heavily veiled. Some of the causes of this date far back in the ages, when tribal views and religious discordances marked history. As in history, so in the Bible. To study this scripture literally, and accept its teachings literally, is obscuratization of the real Truth. Theosophy does not teach a literal construction of Biblical words.

It does not teach a carnalized Christ.

Pray note: The "man of sorrow," as the Bible states, in answer to the question from his disciple: "Tell us when these things shall be, and what shall be the sign of thy presence and of the consummation of the age?" spoke as follows:

Take heed that no man lead you astray; for many shall come in my name, saying, "I am the Christ," and shall lead many astray, and ye shall hear of wars . . . but the end is not yet. For nation shall rise against nation, and kingdom against kingdom, and there shall be famines and earthquakes in divers places. But all these things are the beginnings of travail. . . . Many false prophets shall arise, and shall lead many astray. . . . Then shall the end come. . . . When ye see the abomination of desolation which was spoken through Daniel. . . . Then if any man shall say unto you, "Lo! here is the Christ, or there," believe him not. . . . If they shall say unto you, "Behold, he is in the wilderness," go not forth; "Behold, he is in the inner chambers," believe them not. For, as the lightning cometh forth from the East, and is seen even in the West, so shall be the presence of the Son of Man.

Clearly in these statements of Jesus can we see the *inner* presence of the spiritual life declared emphatically—the divine principle in every human being; also, that this Christos spirit is the living power in the redemption of man. In these sayings do we not see the protest against creeds and sects and false prophets? And yet do we not see today all the paraphernalia of a religion of arrogance among us?

H. P. Blavatsky in speaking of the World's Sacred Books, which included the New Testament, says that these texts themselves are mines of Universal Truth; but for the world

of the profane, and for sinners at any rate, they are still like those mysterious characters traced by "the fingers of a man's hand on the walls of the palace of Belshazzar." *They need a Daniel to read and understand them.* She says further: "Truth has not allowed herself to remain without witnesses. There are, besides great Initiates in the scriptural symbology, a number of students of the mysteries of Archaic Esotericism, of scholars proficient in Hebrew and other dead languages, who have devoted their lives to unriddle the speeches of the Sphinx of the World-Religions."

She says again: "The more one studies ancient religious texts, the more one finds that the groundwork of the New Testament is the same as the groundwork of the Vedas, of the Egyptian Theogony, and the Mazdean allegories."

Referring to the Biblical quotation, "Verily I say unto you, Except ye eat the flesh of the Son of Man, and drink his blood, ye have not life in yourselves," she says that the deeper meaning of these words of Jesus can never be understood or appreciated, except by those who hold at least *some* of the seven keys. These words, whether said by Jesus of Nazareth or Jesua Ben-Panthera, are the words of an Initiate. "The first key," says Madame Blavatsky, "that one has to use to unravel the dark secrets involved in the mystic name of Christ, is the key which unlocked the door to the mysteries of the primitive Aryans, Sabaeans and Egyptians. . . . He who finds *Christos* within himself, and recognizes the latter as his only way, becomes a follower and an apostle of Christ, though he may have never been baptized, nor even have met a 'Christian,' still less called himself one."

Far-fetched indeed will be my subject, and futile my efforts, if my hearers do not grasp the deeper meaning of my talk with them tonight. Humanity in its dire need, even at this present time, is calling through the silence for that help which only can be given in the light of knowledge, understandingly. The discordant notes in the religious world today fill the air with despair; and the shadows of war, vice and ignorance, darken the horizon of man's spiritual life; while the unbrotherliness of the age is appalling!

May my simple words have telling effect upon those who have come in touch with my thoughts. May it arouse them to more unselfish effort for the world's good. The human mind must be stimulated to deeper thinking and more profound religion. It cannot gain spiritual strength until it has obtained spiritual life. Again and again do I urge a spiritual renaissance for man—a royal awakening through the study of Theosophy and all that it embraces. "Man, know thyself!" for, as says one of our modern writers,

Human nature under liberty, will vindicate itself as a divine creation, the freer, the more harmonious, orderly, balanced, and beautiful it is. The physical system proves it by the increased vigor and heightened enjoyment of men who obey the laws of their constitution. The intellectual system proves it by the beneficence of knowledge. The social system proves it by the struggle against vice, crime, turpitude, under voluntary régime. The moral condition of the world proves it: where conscience is freest, it rights the most evils, relieves the most poverty, corrects the most sin. The spiritual system proves it; for where the soul is freest, it frames for itself the freest, the most encouraging, the most beautiful, most earnest faith.

## Art Music Literature and the Drama

### The Art of Ancient Egypt

NEWS of paramount interest to artists and to all who believe that the recovery of examples of the art and architecture of ancient Egypt will open a new page in the book of modern art-life is again at hand.

The curator of Egyptian antiquities on the staff of the Metropolitan Museum of Art in New York has issued a report, giving in detail the results of the second year's work of the expedition of which he is director. The first year's work included important discoveries in the Pyramid of Amenemhat I. The main architectural features of the pyramid and the great altar and stela of the king were recovered, and the tomb and sarcophagus of an Egyptian woman were found, the latter containing art-objects of great value. This expedition has obtained a valuable concession from the Egyptian government at the oasis of Kharga, where there are ancient cemeteries which it is believed will richly repay exploration and systematic excavation.

The oasis of Kharga is situated in the Libyan desert, about 400 miles southwest of Cairo and 120 miles due west of the Nile valley at Thebes.

It is an irregular elliptical shaped basin with axis north and south, and within the limiting escarpments of the oasis and the adjacent plateau is some seventy-five miles long by twelve to fifteen broad. The floor of the oasis, however, with its villages, wells, and cultivated lands, covers but a small part of this area. The principle village, Kharga, from which the oasis takes its name, is in the northern part of the basin, some ten or twelve miles south of its northernmost limits, and it is in this end of the oasis that its principal ancient cemeteries and remains are found. The concession comprises the whole of this northern district, north of the line of Kharga village.

Dotted over it are a considerable number of ruined structures of various types, of which the most important are the Temple of Hibis, dating from the Persian period, and the Ptolemaic temple of Nadura. The greater part of the smaller ruins, however, are of the Roman and early Christian periods. Nestorius, bishop of Constantinople, was banished to the oasis in A.D. 434, and it is probable that some of the later constructions are due to him and his followers.

On a hill some two and a half miles north of

Kharga village is the largest of the Christian cemeteries, of which the tomb chapels are in an unusually perfect state of preservation. They are some 200 in number, their exteriors adorned with columns, pilasters and arches, and their interior walls in some cases still retaining the frescoes with which they were ornamented.

Lomaland Photo. and Engraving Dept.

### PORTRAIT OF EARL PER BRAHE THE YOUNGER

This portrait hangs on the walls of the famous castle, still in possession of the Brahe family, at Skokloster, near Upsala, Sweden. In this castle are many art-treasures which were formerly at Visingsborg. This portrait is from the hand of the Dutch painter, David Beck, Court Painter to Queen Christina, about the year 1650.

For full accounts of the life of Earl Per Brahe, and of his great educational work, founded at Visingsö in the Seventeenth century, so soon to be brought to the attention of the world by Katherine Tingley through the Râja Yoga School and Academy to be opened on her recently-acquired Visingsö property, see previous issues of the CENTURY PATH.

At other points in the concession are the remains of early monasteries, one of which, about half a mile north of the cemetery, has its walls still preserved to a height of about fifty feet, and inside the remains of at least three floors of vaulted cells.

Until the present year it has been possible to reach the oasis only by a camel journey of four or five days from the Nile valley, and it is doubtless owing to this remoteness of position that the site has escaped much of the plundering that those in Egypt proper have suffered in modern times.

An important feature of the expedition's work is the making of records of the inscriptions, wall-paintings and sculptures of Egyptian tombs. At present a full-sized reproduction of the tomb of Nakht, at Thebes, is being carried out. This work will be of inestimable value to the art student of the future, although not until the light of Theosophy is thrown upon the history of ancient Egypt will the deeper knowledge of that hoary land be revealed. How little we know of the art and architecture of the past, at best! Between the ravages of time and the yet worse ravages of the fanatic, we moderns have been left none too well off. STUDENT

### Another Victory for the Drama

THE *Exposition Théâtrale*, the opening of which in Paris was noticed in these columns, will continue open throughout the summer, installed as it is in the spacious galleries of the Louvre. It is acknowledged that no such serious effort to assemble documents, properties, etc., connected with theatrical art has ever been made before, and it is most significant that in spite of conservatism which opposed the idea of placing anything connected with the stage on a level with the fine arts, the Louvre should have opened its doors and welcomed it. Some idea of the scope of the exhibition can be gained from an enumeration of several sections, among them the following: Greek and Roman Antiquities, Old Portraits and Pictures, Pastels, Water Colors, and Gouaches, Miniatures and Drawings, Models of Stage Scenery, Marionettes, Statuettes and Ceramics, Costumes, Accessories, Manuscripts and Documents.

One of the best known of French actors has spent a life-time in collecting antique art-objects and documents connected with the stage, and his collection added to the rest has been a treasure-mine for students. The main interest to Theosophists lies in the fact that the exhibition is a sign pointing to a wider recognition of the stage as an educational factor of dignity and weight. The future will open many doorways that a purified drama will enter in. STUDENT

A man who foolishly does me wrong, I will return to him the protection of my undying love; the more evil comes from him, the more good shall go to him from me. Hatred ceaseth not by hatred at any time; hatred ceaseth by love. This is an old rule.—*Gautama Buddha, 600 B. C.*

### The Râja Yoga Nursery

**H**OW fortunate are those who live within its precincts! Who will ever be able to estimate what suffering and misfortune it averts, what rare unfoldings it makes possible? For not only are the little bodies nurtured and strengthened, and not only is happiness for the moment considered, as is the case in all good nurseries, but little by little is that removed which can, and otherwise inevitably will, bring disease and sorrow in later years. Something magic takes place in the Râja Yoga Nursery. There is a cleansing process going on there which will in later years call forth from those who have experienced it the deepest soul gratitude.

How constantly do we observe about us those who would be successful or healthy or happy, or all three, were it not for this or for that quality? It may be a lack of perseverance, or a lack of thoroughness which has run through one's life, loosening his effect in every direction. It may be stubbornness or conceit which has closed his eyes to the opportunities about him. It may be vanity or ambition which has held his soul to earth and prevented the expression of his talent. Lack of self-control and a tendency to some form of indulgence may have wrecked his whole life. Constantly do we see that selfishness in its myriad aspects has wrapped itself about the soul and held it as in a darkened prison throughout a life, so that when death comes to liberate it there is nothing to record in the book of that life-time but failure.

In the Râja Yoga Nursery these sad truths are never forgotten, and the Râja Yoga teacher does not pass lightly over these qualities which are the enemies of man as she sees them appear one after the other in these tender natures. For, surely, there they all are in seed, ready to sprout and grow strong, unless someone, at this early age, has the strength and patience, the knowledge and insight to weed them out and to do this thoroughly.

### GENTLENESS

A. LAMPMAN

**B**LIND multitudes that jar confusedly  
At strife, earth's children, will ye never rest  
From toils made hateful here, and dawns distressed  
With raveling self-engendered misery?  
And will ye never know, till sleep shall see  
Your graves, how dreadful and how dark indeed  
Are pride, self-will, and blind-voiced anger, greed,  
And malice with its subtle cruelty?

How beautiful is gentleness, whose face  
Like April sunshine, or the summer rain,  
Swells everywhere the buds of generous thought?  
So easy, and so sweet it is, its grace  
Smooths out so soon the tangled knots of pain.  
Can ye not learn it? will ye not be taught?—*Selected*

Theosophy teaches how to gain this knowledge, but can only teach it to those who are ready to live the life and who have the will to clean up their own natures. Think what it must be to a soul to start its life with these awful limitations loosened instead of tightened as is so constantly done through an ignorance of human nature and its needs! Think of the deeper joy which will come to those parents later, who, through a true mother love, have been strong enough to forgo some present pleasure! And think of the help to the world when it shall see revealed the possibilities in man! **GERTRUDE W. VAN PELT**

### Notes About the Nursery in Lomaland

**T**HE Râja Yoga Nursery in Lomaland, as many students know, has for some years been under the superintendency of Dr. van Pelt, who possesses that very unusual combination of scientific knowledge and the true mother-instinct. Entering the home—the prettiest spot on Loma Hill, by the way—one recognizes at once the true woman's touch. The pretty, airy rooms, the flowers, the tiny beds, the curtains, even the rugs on the floor and the piano, all betray the loving, home-making care-taker and designer. But a mo-

ment later the careful observer sees that an expert in hygienics has been at work—the sanitary white iron beds, such wee little resting-places! the spotless polished floors, the care with which only easily cleaned materials have been chosen for everything, the row of white-labeled bottles in the room where the food is prepared, the shining utensils for the milk, not ordinary pots and pans but the measuring-glasses and apparatus of a chemist—all these things show the kind of knowledge that mothers should have, the world over, but alas! do not.

Dr. van Pelt early in her college career won a B. S. degree (Cornell), later graduated in Medicine at an Eastern College, to pursue a lengthy post-graduate course in European hospitals, among them the world-famous Maternity Hospital in Vienna. But the babies don't mind little things like diplomas and degrees and they cluster about her after their home visits in a confident, affectionate way that is the greatest tribute of all. That is the criterion and the test, after all, the awakening of love by love. It is this flame of unselfish devotion, constantly burning in the hearts of those who work with the little children of Lomaland, and unmixed with the qualities which so often mar mother-love, as the world goes, that makes the Babies' Home a sacred place. When the mothers of the world, who indeed do a heroic work, placed as they are between the Scylla of ignorance and the Charybdis of the lower psychological influences in human life, fully realize the deeper needs of their children, they will turn to Theosophy as a struggling plant turns to the light; and hundreds and thousands are already turning their eyes towards Lomaland as the one Place of Promise, the one beacon to show them the way.

Dr. van Pelt came to Lomaland in the pioneer days and has been, ever since her coming, Superintendent of the International Lotus Home. She is also a member of Katherine Tingley's Cabinet. **LOMALAND STUDENT**

### Hygiene in the Schools

THE importance of medicine as a prophylactic science has been more and more recognized of late years by mothers and fathers of children, and many of our ablest minds direct their energies toward preventing disease instead of waiting until the damage has been done. This work has accomplished an enormous amount of good. The means used have of course been physical, such as asepsis, antiseptics, protection against contagion, proper drainage, etc. At a recent medical convention in Chicago, the doctors decided that the community should be generally educated as to how to guard its health, and to this end it was agreed that the public schools should make hygiene a special study.

One can imagine that this would mean a thorough study of hygiene as it is taught in the text books. Certainly in these matters all should be instructed. But it is to be hoped that the attention will not be altogether arrested here. Although in dealing with the public health in masses, and in the instituting of means to preserve it, it is necessary perhaps to confine them to physical means, the moment we enter the schools and attempt to instruct the children, there is no such limitation. They can be taught the influence of the mind on the body. They can be made to understand that every time they have a temper, every time they sulk, every time they allow themselves to indulge in mean, envious thoughts, in hatred, that their bodies suffer deeply. And above all, if they indulge in any secret vice they can never be well, for not only will they become nervously exhausted, but all the above-mentioned thoughts, which in their turn work havoc, are sure to be invited.

The instance of the woman who after a terrible rage nursed her babe and thereby so poisoned it that it died is told in the physiologies, but the lesson to be gained from this history is not generally worked into the consciousness of the young learners. And above all there is no practical demonstration of these facts brought forward.

There are some people who always emit a terrible odor when in a temper. Who has not perceived how utterly weak and exhausted one becomes under the influence of an unhappy emotion; how worry destroys vigor; how anxiety removes appetite, produces headache and so forth? There are no more potent or more common causes of ill-health than wrong mental states, and important as are the rules of physical hygiene, alone, they can never accomplish the result, and parents are beginning to realize it. It is these facts which are understood in the Râja Yoga Schools and one reason for the astonishing mental accomplishments of the children lies in the fact that the latter realize the importance of self-control. They know that a day's indulgence in a mean, low feeling or "temper" costs anyone's brain and body more than a week's hard study at books. They know that the moody child has slender chance of keeping abreast of the one who is self-controlled—and why. STUDENT

### Jottings and Doings

(From a Student's Note Book)

THE following account is clipped from a Californian daily, having been cabled from London at a recent date:

On stated occasions Queen Alexandra makes a point of entertaining the children of the workmen on the Sandringham estate to tea in the royal schoolroom.

As the Queen and Princess Victoria were walking in the grounds of Sandringham during the latest school feast, they noticed a group of children wistfully looking through the Norwich gate in the direction of the schoolhouse presumably in the hope that they might be invited within. The Queen immedi-

The great esteem in which woman is held in America, and the beauty that distinguishes the American woman above all her sisters has led America's greatest artists to devote themselves principally to portrait painting. The majority of those portrait painters studied in the French school—only a few follow in the footsteps of Sargent, the greatest painter America has produced. . . .

In the United States woman has reached the zenith of perfection. No nation in the world can compete with America as to female beauty.

I call them living objects of art, for each is a most beautiful expression of art, with her nobly formed head proudly poised. She is gowned as no queen ever dreamed of being gowned, and has the hair of a goddess, incomparably rich and of all enchanting tints.

Lomaland Photo. and Engraving Dept.

DÜRER'S "MARY AND CHILD"

ately stopped and spoke to them, asking if they were not going in to the treat in the schoolroom.

"No, Your Majesty," answered a little mite of a girl. "If you please, we don't go to the royal school."

"But your father works on the royal estate, doesn't he?" prompted the Queen.

"Yes, Your Majesty."

"And what does your father do?" asked Queen Alexandra.

"If you please, Queen, feyther's a poacher," was the youngster's naïve reply, to the merriment of the Queen, who saw that the children were admitted to the tea party, and that "feyther's" occupation was rendered unnecessary for a few days at least by a goodly present of game.

A NEW theory is advanced by Herr Eberlein, one of Germany's greatest sculptors, to account for the remarkable work of American painters in portraiture. He said recently to an American journalist, and having been sent to America by the Kaiser to investigate art conditions, his words have a certain weight, being those of a cultured observer:

WASHINGTON, July 19.—Examination of children under 16 years of age, who desire to work under the provisions of the new child labor law of the District of Columbia, has demonstrated that city girls are far healthier than city boys. Out of a total of 1700 children examined since June 30, the inspectors have rejected seventy-five boys for physical disability and only two girls. The same proportion in the matter of health, it is believed, exists in all the large cities of the country.

R. O. Wilmarth, who is in charge of the examinations, gave out figures today to show that girls between 12 and 16 years of age are far better qualified to battle with the world than their brothers. While the number of applicants for permits to work includes more boys than girls, yet the percentage of rejections in the case of the boys has occasioned surprise. The lads, for the most part, are found to be suffering from heart and lung troubles.—*Exchange*.

We would like to inquire what percentage of city boys between twelve and sixteen years of age smoke cigarettes? An answer would throw great light upon this question of the relative physical qualifications of boys and girls. No careful observer of the child-life of any large city can have failed to notice the enormous proportion of boys of a certain class who hang idly about the streets, often gambling, and always with a cigarette displayed proudly. The little girls of corresponding age and class generally spend these hours at home "tending baby" and are usually greatly overworked by the demands of household duties. Yet in spite of this often cruel strain statistics show that idleness and self-indulgence will wreck the health far sooner than work or overwork.

It is stated that the Countess Russell of England keeps several hundred fowls, after the most approved scientific methods, at her country home near London, that she is making of poultry-raising a success and may shortly open a shop for the sale of the products of her enterprise. Her success is due to the close personal supervision she gives, in inspecting the coops and runs daily, often preparing the food and doctoring them herself through their various mishaps and illnesses. During a recent freshet, when her poultry grounds were flooded, the Countess donned water boots and personally aided in the work of rescuing her wards. It is easy to read in this account the secret of success in general—personal service.

## Mystic Cave

A WONDERFUL cave of unguessed magnitude in the Platt National Park, Oklahoma, U. S. A., is now being explored. It has been fitly named Mystic Cave and its marvels are said to surpass those of the Luray caverns or the famous and beautiful Mammoth Cave in Kentucky. While its discovery by white men is quite recent, Indians of the Choctaw tribe and others earnestly declare that the cave has been known to their people for centuries.

The first exploring party encountered many grave perils, some of its members barely escaping with their lives. The entrance to the cave is a round hole in the ground surrounded by low trees. Into this opening the party descended by means of a rope fastened to a tree. They found themselves upon gaining a foothold, in the usual cavern chamber, the ceiling covered with stalactites, while rising from the floor were the usual stalagmites. Descending a small opening in one corner of this Council Hall, as they called it, the men found, about twenty-five feet below, a large sheet of water in which fish with white eyes were swimming.

A rock ceiling hung so low over this body of water, that the men could not explore it in their canvas boat, so they returned to the chamber above. There finding a hitherto undiscovered opening, one by one the whole party descended by means of ropes. It proved a narrow and twisted shaft. Down, down they went for a hundred yards farther into the bowels of the earth. When they landed they

found themselves on the shores of the "lost river" which flowed away swiftly into the blackness, while the reverberations of a distant subterranean cataract, falling upon their ears, awed them into silence. Two of the party were so daring as to launch the boat upon this unknown flood, and with a rope, one end of

**DOUBT** of any sort cannot be removed except by action! on which ground, too, let him who gropes painfully in the darkness or in uncertain light, and prays vehemently that the dawn may ripen into day, lay this other precept well to heart, which to me was of invaluable service: "Do the duty which lies nearest thee, which thou knowest to be a duty! Thy second duty will already have become clearer." — *Carlyle*

which was left for safety in the hands of their comrades, they started off on their perilous venture. Their signals were misunderstood, however, and their comrades let go the rope. Before they saw daylight again they had passed through an awful experience.

Thus a new subterranean wonder with all its weird beauty and grandeur was disclosed through the daring of a few brave men. And when we consider how little is known of the interior of the earth, how short a distance in comparison to its bulk we have penetrated, we better realize the value of all service that helps to penetrate the mysteries of earth's unfathomed depths.

STUDENT

He that buys what he does not want will soon want what he cannot buy.—*Selected*

## In Pinar del Rio

AT the Academy in Pinar del Rio, Cuba, as at all other Rāja Yoga Schools, the pupils are instructed in a great variety of hand-work. The baskets you see in the cut on this page are the work of the girls and the younger children, and are made of raffia and of native materials which the pupils are encouraged to find and use. Some beautiful baskets have been made of pine needles and of majagua, which is the inner, fibrous bark of a certain tree. A way has been found to fashion useful and ornamental articles from palm leaves and bark also. The children take great pleasure in making such things to beautify their schoolrooms.

It is very interesting to picture the Rāja Yoga pupils in Pinar del Rio studying so faithfully to become good English scholars, taking part in chorus and orchestra work and practising on many instruments, drawing and painting, and modelling in clay, attending Boy's Club or Girl's League meetings, playing basket-ball in the patio, which much be a very large one, gathering for pleasant evenings after school-work in the Academy—in short leading the busy, happy, inspiring, all-round life which is set going for the young folk wherever Rāja Yoga is established.

G.

THE Japanese use knots for fastenings in many cases where other people use hooks and eyes, or buttons. The children of each generation are taught to tie these knots some of which have been used for hundreds of years. They make very artistic fastenings.

ONE OF THE FIRST RAILWAY TRAINS IN GERMANY

## A Surprise in Rübezahls Kingdom

"TING-A-LING! Toot toot! Brr-r-r!" and the sounds rolled and rumbled and re-echoed again and again through the caverns of the Giant Mountains, where the gnomes and trolls were building a new palace of sapphires and rubies, opals and garnets, for Rübezahls, their king. They dropped their hammers and mallets and tumbled over each other, all agog to reach the upper world to see what caused the great noise. They found a large crowd of echo-dwarfs sitting on the rocks and they were all sending the sounds back as lustily as ever their big lungs could. Their faces were all pulled out of shape they worked so hard.

"What's the matter, what's the matter?" cried the gnomes and trolls all at once. As the last echo was sent back, one of the dwarfs, all out of breath, answered, "Why don't you know? Those busy creatures called men who are always trying to find out new things have just made a great iron monster that runs by itself. It has the strength of a hundred horses. They call it a locomotive, whatever that is! and they have made an iron road for it to run on, which they call a railroad, so that it can run quickly. Just think, it is so strong that they make it draw their carriages and their stage coaches for them, five, or six, or ten, all in a row! Why—" and the dwarf grew more excited, "I saw a great golden chariot, just like Cinderella's, with a coachman and footman sitting on top, and ladies with parasols, and gentlemen talking, sitting inside, being drawn along at the end of the train by the iron monster!"

"How can it move? This iron creature has no life!" said several gnomes at once. "Oh yes it has!" replied the echo dwarfs, who knew all about it; for had they not been down the River Elbe as far as the city of Dresden? "As he runs you can hear him breathe *chu, chu, chu!* and all the time a great white breath rises from his mouth. He's an ugly black creature though, and I heard people say to each other as they shook their heads, that they would much rather ride behind horses, it was

## THE SKY IS A DRINKING-CUP

RICHARD HENRY STODDARD

THE sky is a drinking-cup  
That was overturned of old,  
And it pours in the eyes of men  
Its wine of airy gold.

We drink that wine all day,  
Till the last drop is drained up;  
And are lighted off to bed  
By the jewels in the cup.—Selected

safer. And then it made them dizzy to go so fast, and suppose the iron monster should run off his track!"

"I saw one man standing there with tears in his eyes, so I slipped up behind him to see what was the matter," said a happy-faced echo-dwarf. "It was my old friend the postilion, whose merry *toot, toot, toot, ta-ra, ta-ra, ta-ra*, I had always loved to send sounding back again and again as the stage coach rattled down the mountain side. His work is gone now, and mine is, too," and the echo-dwarf wiped a tear from his own eye.

"Cheer up, cheer up, little Echo," cried a hearty voice, "there will be plenty of work for you still, and for all the gnomes and trolls in the world!" and their king and master Rübezahls the Mighty stood before them. Instantly their tall peaked caps were sweeping the ground as they bowed before him.

"This great iron giant," continued Rübezahls, "is one of the first of a large family who will be born in the years to come. They have tremendous appetites. Their chief food is coal, so you, gnomes and trolls, will be kept busy supplying it. These iron giants will find their way into every part of the world, across lands and over seas. They will awaken echo-dwarfs who have been sleeping for millions of years.

"They will help to weave a girdle of iron around the earth."

The gnomes and trolls and echo-dwarfs stood in silence while their king spoke, then went back to their work, while the great iron giant drew the train along to the far away city of Berlin.

UNCLE OSWALD

## A Story About Three Dogs

DEAR Rāja Yoga Boys and Girls: I know you are greatly interested in brotherly actions, and I write to tell you of one I witnessed here in New South Wales. I am living in a suburb of Sydney, the picture of which city you no doubt saw in the CENTURY PATH. Here a little boy has two dogs. One is a large collie dog, with big kindly, brown eyes, called Nero. He is a playful and good-natured dog, and when he is told he will jump on a chair, and if you hold out your hand he will raise his paw and place it in your hand. Then he will do the same thing with the other paw. The other dog is a little fox terrier called Sailor. He is very sharp, but very playful too.

These two dogs are very fond of each other. A few days ago a large brown retriever dog came rushing up straight towards little Sailor. But just as he got close, Nero, apparently thinking the strange dog meant to do harm to little Sailor, pushed his head in between them at the right time to prevent it. The stranger dog then quickly tried to come at Sailor round behind Nero, who immediately turned again and blocked him. Nero had not growled once. But he was bent on protecting little Sailor. After this third attempt something happened. I think the strange dog gave Nero a password. It must have been "Brotherhood," for Nero seemed suddenly pleased and he let the strange dog pass. The stranger thereupon began to bark and play with Sailor and all three dogs were very merry together. UNCLE ALFRED

## Carrier Pigeons as Messengers

IN the north of Scotland there is a doctor who has to drive many miles to visit some of his patients. He takes with him several carrier pigeons and sends them back to his office with a message asking for the prescriptions that need to be made up and sent at once. Then these reach the sick person very soon. If any of these patients living far off are so ill that they may need to have the doctor come again to see them, he leaves pigeons with them which can be sent to him with a line asking him to come. MARIANNE

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogenesis  
Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

## **SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM**

by H. P. Blavatsky and William Q. Judge

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"  
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its *rationale*, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

Price - 15 cents

## Chance and Law.

A RATHER confused but suggestive article on luck and chance, appearing in a daily paper, gives occasion for a few remarks on that interesting subject.

The writer states that the fall of dice and other chance occurrences have been investigated by mathematicians, and the fact "discovered" that what we call chance is subject to law. Surely this rather misstates the case. Is the "Theory of Probabilities," as it is called, an inductive science based on observation and experiment? Or is it a set of theorems based on axioms? The theory attempts to assign adequate values to the various causes contributory to an event and therefrom to deduce the event. As the causes contributory to events are both numerous and variable, this attempt is one of infinite difficulty, and all that can be realized is an approximation. In the long run and on the large scale this approximation becomes closer and closer, because in the long run and on the large scale the various influences tend to get evened up. But on the small scale, which is that with which we are chiefly concerned in daily life, the broad general principles of the theory diverge from actuality. This is illustrated by the writer, who instances baseball averages, which are influenced by factors which the theory of probabilities does not take into account, such as the player's form for the season, the weather, etc. In the long run these would even up, but not in the short run. In a treatise on Probabilities by a learned mathematician one reads that where the "theoretical result appears to differ from the common-sense view, it often happens that the latter may, though perhaps unknown to the mind itself, have taken account of circumstances in the case omitted by the theoretical problem." And the same learned writer says that Probability is a theory which "has been found to harmonize with and justify the conclusions to which mankind have been led, not by reasoning, but by instinct and experience."

## Unity Behind Diversity

Thus Probabilities can hardly be defined as a discovery. It is an attempt to formulate the complex of causes and events into a mathematical system, to systematize the reasoning whereby we infer the events from the causes; and it also lays down that the larger the scale, the more balanced will be the workings. Like mensuration, it is an adaptation of pure mathematics to practical uses, and, so far from discovering

law, it sets out by assuming the existence of law and then tries to use this law as a means of interpreting events.

Chance is the generic name for all *causes which escape our observation*. So long as we bear in mind that it is merely an abstraction, a generic name, it may be convenient to use it; but let us beware of exalting it into a cause. If we say that an event was determined by chance, it is like saying that a stone is drawn to the earth by gravitation or that a man moves by the force of motion; whereas the words, "chance," "gravitation," and "motion" are names for the effects, not the causes. When we say that a thing happens by chance, we should imply no more than that the causes of its happening are unknown to us.

## Nothing Happens "By Chance"

Everything that happens must have a cause or causes; we can scarcely divide events into the two classes of caused and causeless! Our own actions are partly determined by causes of which we are conscious, and partly by causes of which we are not conscious. The latter we call "casual." Yet this is pure nonsense unless it means only that the causes are unknown. Take the case of the dice. What cause determines the throw? That unknown cause is transmitted through our muscles, nerves, and other mechanism, but our conscious mind is not the deciding agent. What then is? Clearly another mind.

Our casual meetings on the street are regulated by causes, difficult to trace, but not impossible. The attempt to trace them would lead us back along a multitude of chains until our intellects succumbed under the complexity; but reality takes no account of the limitations of our intellects. The fact remains, that despite our incompetency, these events all have their definite causes.

The question as to what determines the result of tossing a coin is very interesting. Science recoils from it baffled, and the mathematician just quoted speaks guardedly of an "omniscient Being." But there is no need to commit the theological blunder of conceiving the Absolute First Cause as directly concerned in all those (non-absolute) details of cosmic law which do not happen to come under our observation. To do so is to make the Deity a mere scientific generalization. Ancient science, unable to fool itself by creating mental abstractions and then "reifying" them, attributed every action to the working of a Being; and in the descriptions of "elementals," "nature-spirits," etc., and how to conjure them,

## Active Centers of the Universal Consciousness

we have fragments — *only* fragments — of the ancient teachings with regard to those domains of nature still unexplored by our science. Divination and augury depended on the knowledge that the latent mind of man, and the mind of nature, *could* be read by interpreting the signs; and it is no more absurd to make marks in the sand or watch the flight of

**Mind Active  
in a Perfect  
Fluid**

birds than to stick out a barometer, and watch the air pressures on the mercury.

The unseen and unrecognized agents, both in ourselves and in the universe, play a much greater part in affairs than we think. Our casual walkings, and sayings, and thinkings, are governed by whims, impulses, and so on; but that is only a very partial explanation, for what in its turn governs these latter secondary causes? Clearly there is plenty of scope here for the intervention of things extraneous to our deliberately conscious control; our organisms and minds are sensitive machines ready to act under very slight impulses, and most of these impulses come from — we know not where.

We walk down the street, turn to the right instead of the left, meet a person, and — our whole life is changed. Was this chance? Could we have turned to the left? Did God's almighty finger protrude invisibly through the clouds and guide our steps? Or was this event the result of causes that had been accumulating for years, engendered by the

**Behind  
Effects Lie  
Desires**

thoughts of half a lifetime, until finally the pressure found vent in action? Is it not evident that our daily thoughts and desires constitute a most

powerful complex of causes? Now causes must produce effects — yes, even when neutralized by other causes, the neutralization being itself an effect. On the other hand we have a host of effects with unassigned causes. Why not do a little mating and pairing off? The Almighty gets credit for a good many things we do ourselves. If we are always thinking of stealing chickens, it is quite likely that sooner or later we will be "guided" to a hen-roost!

The law of Karma, spoken of by Theosophy, is a name for that universal law that prevails throughout the universe. It could be traced in the high and the low, the great and the small, from the throw of the dice to the events that attend the life of nations. Many of the causes which bear fruitage of effects in our lives exist but in the form of seeds — seeds which we have carried over from former lives. These grow and from them comes the tree of our life; while every moment we sow

**The Seeds of  
Desires  
Shall Have  
Fruition**

fresh seeds. And the point is that those seeds are actually there; they are not pious aspirations or abstract speculations. In the imperfection

of our minds some may imagine a cause as a God with a frowning brow, or as a kind of nebula with the word "Karma" printed across it; but generalizations are not the practical agents in life. Actions are wrought by Beings; and, could we see with the eyes of the Initiate, we should perceive the hosts of beings by which our progress through life is attended and which go to make up that heterogeneous affair we call "ourselves."

The important point is for people to recog-

nize that, by their own mental attitude, they *can* determine the events of their lives, even the so-called casual ones. They may not be able to control all, but they can control some; and as time goes on that control will extend. As it is, the belief in supernatural things like "Chance" throws us open to the influence of all kinds of minor forces which we should be very sorry to obey if we knew what they were. This kind of passive submission is no good to humanity. We should arouse our will and determine to figure as causes in the universe, being confident that he who sows good seed shall in due season reap the harvest, and being content to reap what we have already sown.

STUDENT

### Theosophy and Religion

EVERY thoughtful observer of the times knows that there is going on in the world today a great religious reconstruction. It cannot be stopped. Who knows whither it will lead? The discoveries and inventions of science, the expansion of commerce, the study of foreign and ancient races, and many other similar causes, have so welded humanity together, so enlarged our view of mankind both geographically and historically, that the religious ideas which sufficed our ancestors will not suffice us.

Religious ideas, like everything else, must adapt themselves to the growth of knowledge. But there is a terrible struggle arising from the attempt to distinguish between what is permanent in religion and what is temporary, and to retain the former while changing the latter.

One thing we cannot do: that is, continue to regard Christianity as the final and supreme revelation of Divinity to man, superseding all others and never to be superseded itself. The dignitaries of established churches may cling to that view, as the duties of their position seem to demand, and with more or less real conviction according to the degree of their sincerity. But there is a "science of comparative theology," as it is called, which can never tolerate such a view, and must fain, in the name of reason and common sense, put Christianity in the same class as other religious dispensations — that is, class it as a temporary, racial, and local dispensation.

The Christianity which we preach to non-Christian nations is not a merely religious or theological cult. It is the Western spirit — "Christendom" would be a more fitting name for it. It includes Western ideas of life, commerce, education, progress, science, manners, etc. Corresponding to this missionizing effort, we have now a back-current setting in and carrying Buddhist missionaries to London and New York to inculcate among the Westerners an Oriental spirit.

The times are moving very fast, and the seething and boiling in the church cauldron is indeed a spectacle. Different schools of advance-thought in theology are taking different courses; and, though each has found a standing-ground for itself, the combined effect is to leave no standing-ground at all. One wipes away everything except the teachings of Jesus in the Gospels; another rejects these teachings but finds its consolation in the personality of Jesus, or in the "Christ-ideal."

The question as to whether Christianity has

or has not done good in the world need not detain us, as we have to consider the far more momentous question of whether it can do good in the future. Everyone seems agreed that at least it must be reconstructed, that it cannot do good by continuing as it is at present, that it has lost its power to influence the world and is being left behind. Then comes the question, *Can* Christianity be so reconstructed?

It cannot be reconstructed as Christianity. The expansion of ideas and the blending of humanity will prevent that. The association of the new religion with the name of a particular World-Savior and with a particular revival of the Light is too narrow and exclusive. The spirit of the ancient universal RELIGION is stirring once more in humanity, and it cannot be cornered by any church or creed.

The study of comparative religion is bringing home to us with more force each day the truth that Religion *per se* is eternal and unchanging, being based on those fundamental verities which all mankind recognize as the truth; and that the diverse forms under which religion is organized change with the times. The futile attempts to do without any religion at all have shown that there is in religion something that cannot be dispensed with. How can we throw away the husk and keep the kernel?

The real religion will not be a mere residue left after all points of difference have been eliminated; such a compromise would amount to nothing and the result would be altogether too negative. There must be a definite positive revival of the eternal Wisdom-Religion, with power and light to make its appeal and exert a compelling force. H. P. Blavatsky came to prepare the way for such a revival. Like all great Teachers, she was unrecognized and unwelcome; but her work has endured. Since her day, the heaven has worked with amazing effect, and the general breaking up and rearranging of old forms has proceeded to a point that could never have been anticipated. Her great message was that Theosophy, the Wisdom-Religion of antiquity, was an actual fact; and that message — has it not forced itself upon the world? Like a wedge the truth is cleaving its way through the hard shells; like a searchlight, it is exploring all the crannies and revealing what was lurking therein.

Amid the general liquefaction in modern ideas, Theosophy is the one stable thing; and about this center, so firmly established by the Theosophical Leaders, will the future thought of our age crystallize. And thus will be formed the foundation of a faith for the future; thus will humanity be prepared for the reception of another great revelation of the truth, adapted to its current needs, when the time comes for that event to take place.

H. T. EDGE, B. A. (*Cantab.*)

### The Zeppelin Airship

MUCH sympathy is felt everywhere for Count Zeppelin, owing to the recent disaster to his latest and best airship. It has made a flight of 248 miles and exhibited the highest qualities of dirigibility, while its speed is stated to have been about 35 miles an hour. In a recent ascent at Lake Constance the King and Queen of Wurtemberg accompanied the Count, and the airship rose to a height of about a thousand feet. D.

# Some Views on XXth Century Problems

## The Voice of the Shell

THE time has now arrived, according to several researching professors of this country and of England, to say nothing of Italy, when we can consider the postmortem persistence of consciousness and its power to communicate with those "on this side," as demonstrated by research. "We can hear the pickaxes of our comrades."

The professors naturally desire to convince their colleagues and the public, and books are beginning to appear in which the evidence is analysed and favorably summed up. But if the discrimination which they show in rejecting masses of the pseudo-evidence were applied to the rest, a simpler hypothesis and another law in psychology would come into view.

In the earlier days, all the communications coming through, or in the presence of, a medium were accepted as genuine. The researching professors of today begin by eliminating all that are silly, meaningless, or platitudinous. Then they eliminate all that could have come from the depths of the medium's mind, or *through* his mind, by thought-transference, from the minds of those present. What remains must, they think, be the utterance of a discarnate self.

But this remainder too, as is quite realized by the professors, is apt to sound a little vapid. The vapidness must be explained, or the whole case falls to the ground. The explanations are these:

In order to enunciate anything at all, the discarnate self has to plunge into a "suffocating atmosphere," (Professor Hyslop), the atmosphere of the circle, of the world. He can therefore only say the simplest things. One would have thought, however, that the minds of a number of learned men, accustomed to think on abstract matters, and prepared now to do so, would make a pretty good atmosphere.

The normal state of a discarnate self is one comparable to our own hypnotic state! Consequently nothing much can be expected! So the discarnate self, though strongly desirous to communicate, finds that on the one hand his own hypnotized condition, and on the other the dense atmosphere created by the researching minds of his late colleagues, constitute barriers through which he can only utter platitudes.

But the public will ask why these filtered "communications" should not be lumped with the great eliminated mass? Because, it will be answered, they show an identity in forms of thought with those peculiar to the man from whom they purport to come. Ruling out what was known of the man by his friends or acquaintances present, there is still a margin.

The ruled line will look somewhat arbitrary in position. But granting, in some cases, some margin, a little principle in psychology seems to come into view.

On quite other grounds than those afforded by psychical research, we admit, indeed emphatically maintain, the persistence of the soul, the real man or ego. But death has

freed him from something subtler than the material body. Self does not think *directly* upon, into, with, the brain. There is a something intermediate between the purely subjective and the molecules, something which on the one hand receives sensations and arranges them for understanding, and on the other transmits and distributes properly the behests of will to the body. After physical death, consciousness, the real self, withdraws from this also, thus leaving an ethereal, meta-material shell or automaton, filled with the aroma and habit of the late personality. If a man will, lie back in effortless reverie, he can watch a stream of aimless thought drifting continuously across his mind. It will produce nothing new; it is running along upon the strength of past voluntary effort, repeating and recombining. It is this sort of thing, on the purely mechanical side, consciousness having departed, that goes on in the etheric shell to which we refer. The medium's own rudderless thought-apparatus, directed by the wish of the sitters, drifts into relation with the shell; and the similitude of the communications with the habit of the late personality, naturally ensues. The shell can give no real information, for it has acquired none; and the hypnotism hypothesis, if it applies at all, applies to it. And it is itself the "suffocating atmosphere."

STUDENT

## The Culture of Immortality

"I WILL be a great athlete," said the youth, feeling his firm and promising biceps.

He was not particularly unwise, merely carried away by the pulse of life, taking it in its simplest form and translating it into conscious ambition.

After reflection, however, he decided that mental cultivation was better than physical. He would change his ideal. He would invent, amass learning, or become renowned in one of the arts.

Years later, he did some more reflecting. He saw that learning, and all he had gained by it, must come to an end like the biceps. None of it could outlast the brain.

"Never mind," he said, "the *arts*, at least, that I have tried to practise and understand, have refined my sensibilities. My inner nature, thus nourished, cannot be taken away by death. In some other and higher world it will find its home and I can enjoy."

So Death drew near and showed him that other world, full of beauties, and himself and a few other elect and cultured ones therein, aesthetically enjoying — alas, *condemned* to an eternity of that enjoyment!

Sickened, he turned away from the picture. "I want no other world," he cried; "I want this one, and the men and women and children therein. *Here* I must be immortal."

"If you pour yourself into this world," said Death, "into the hearts of men, you have placed yourself beyond my reach. Men will hold you."

"That is no immortality," he cried. "The painters and musicians of the past have left

their works on earth and have themselves vanished. Men hear the music and look at the paintings and remember but the name of him who painted and sang. Where is *he*?"

"Nay," said Death, "such a man gave not himself, he gave but his work, perhaps bargained it in exchange or hoped exchange for renown; himself he kept to himself. That is always so with those who do not work in pure love of their fellows. They remain their own property — little owners of little estates. He who through all his years throws his being into the world in love for its mankind, leaves, at the end of each succeeding life, less and less for me to take, needs less and less the intervening rest-heaven to which I give the key. And in the end his life is also the life of all that lives, nor the less his for that. The Great Life enters him, becomes himself, and passes on through him to nourish and sweeten and raise the life of all other creatures. In them he is conscious and they in him. He is immortal through all bodily changes. He has solved the mystery of the one and the many. Life cannot be kept by seizing, but by giving it."

STUDENT

## The Meaning of Divorces

AT the recent Pan-Anglican Congress in London, the Rev. Dr. D. C. Gardiner, a minister of California and American representative to the Congress,

said that he must confess with some shame that in the city of San Francisco, near which he lived, there was one divorce in every six marriages, which he regarded as a scandalous state of things.

Bishop Doane, another representative from here said:

Here in America we are compelled to strain every nerve in our insistence upon the sanctity of marriage, because, I grieve to say, the country has gained a shameful and sorrowful pre-eminence in what one might almost call "the divorce habit," the statistics of which are alarming and shocking to the last degree.

The average good citizen may not know that when he reads a full account of a murder he is himself a shade nearer to the commission of murder. But he might know it from his knowledge that in the man whose fierce and unbalanced nature is always trigger-set for murder, such an account may pull the trigger.

There are centers of consciousness in human nature, quite intelligent in their way, which lie below the man's own mind and outside the consciousness of mind, or nearly so. And this spirit of license is one of them, ever pressing for the sensual expenditure of that force which rightly cared for can raise man to his noblest heights of thought and power. The man's knowledge of the ease of divorce is obscurely felt by this spirit of license as a slight loosening of its bonds. And from below the feeling will float up into the unguarded mind as half-formed suggestion. Every one who would understand this must look carefully into himself, and think. He will get upon the track of one of the destroying forces of civilization and human nature. STUDENT

## THE ROCK OF SIGIRIYA, CEYLON

### The Rock of Sigiriya

RISING precipitously from the plain to a height of 400 feet, this practically inaccessible rock must always have formed a natural stronghold. The parricide King Kāśyapa, towards the close of the Fifth century A. D., took refuge here from his brother's vengeance, strongly fortified the place, and constructed a wonderful gallery and stairways that led spirally round the rock to the palace and citadel on the top, which was comparatively flat.

Of the spiral gallery, S. M. Burrows, in *The Buried Cities of Ceylon*, says:

"It is unnecessary to expatiate on the skill and boldness of this engineering marvel; it forms a very striking commentary upon an epoch and a civilization of which we are lamentably ignorant; and we are as puzzled to account for the conception as for the execution of such a weird undertaking. The plaster on the high retaining wall is still as smooth and brilliant as on the day when it was applied; and some of the names and inscriptions that are scribbled on it have at least the excuse of dating back to the age of the original builders."

The citadel was most skilfully built in a series of terraces, and so planned that not a yard of the limited space available was wasted. A veritable maze of passages and stairways, very ingeniously

arranged, provided for rapid and easy communication between the various parts. With the same care and forethought, a constant water-supply was ensured by tanks which, filled yearly by the rains of the north-east monsoon, would meet all requirements of the garrison.

But, despite every preparation for a long siege, Kāśyapa was tempted from his impregnable fortress; and, defeated by his brother in a pitched battle—when the two armies met, according to the old chronicle, "like two seas that had burst their bounds,"—he committed suicide on the field. B.

### Modern Fashions in Ancient Mykenae

IN a recent book on Cretan archaeology by Angelo Mosso are illustrations of objects found in the Mykenaeen palaces. One represents a figure wearing the puttees of an Alpine climber or an English officer. Another shows a vase painted with soldiers wearing gaiters like those of Napoleon's grenadiers. Another represents a shoe very like those worn today. The Mykenaeen women wore high-heeled shoes, sometimes with elastic sides. An Egyptian tomb of the XVIIIth Dynasty shows people with shoes of a fashionably pointed kind. The upper leather has a seam such as a modern shoemaker would make, and there are two cords at the ankle. Women are represented in costumes

which might have come out of one of the great modern dry-goods stores.

Does not this show that many of the things we think unique about our civilization are merely perennial phases that repeat themselves often in human history? The people of those old times were men like us, with the same ideas, the same foibles. But the period of history which includes both the Mykenaeans and ourselves is quite a minor subdivision of the human drama, too short for us to draw any conclusions about evolution from it. H.

### Roman Gold Mine in Wales

IT is reported that in Caermarthenshire what it is believed will be the richest gold mines in Wales are about to be worked. The mines are in the woods between Llandeilo and Lampeter and it is believed they were originally discovered and worked by the Romans, for two or three million tons of material lie around.

### Ancient Tunnel in Palestine

THE Palestine Exploration Fund has excavated part of a great tunnel at Gezer. It was made about 2000 B. C., is as high as the London underground electric tube-railway, and half as wide, and descends by 80 steps, the lowest of which is 130 feet below the surface of the ground. T.

# ✻ The Trend of Twentieth Century Science ✻

## Plant Intelligence

THE address of Professor Darwin, who will preside at the forthcoming meeting of the British Association for the Advancement of Science, will doubtless provoke a biological storm. For he is going to maintain that plants have consciousness and intelligence, try experiments, and acquire habits as the result of their experimentation. The intelligence of the plants is, he thinks, but little less than that of the lower animals.

A point in connexion with the origin of species may come up here. Whatever may be the action of natural selection upon varieties which have appeared, the young biologist has occasionally to be reminded that it can do nothing until the appearance has taken place. The number of theories as to the cause of that appearance is the measure of the littleness of our knowledge.

Biologists now generally hold that variations acquired by an individual are not transmitted. If there is a transmission it must be of exceedingly small extent. But it is nevertheless possible that a somewhat considerable variation intelligently developed by a plant in response to the call of its environment, may determine much lesser variation in the same direction in its progeny. And the intelligence of plants may thus actually rank as one of the causes of the slow origination of species.

STUDENT.

## The Deadly Tropics

THE white man has a very fixed idea that in the tropics he ought to wear white.

He knows that it does not cut off the rays of the sun, but he somehow associates it with coolness. Presently, in spite of it, he gets some variety of sunstroke, or otherwise goes under.

But heat is not the secret of the trouble; and if it were, the proper protection would be wool. For the external temperature, the temperature of the tropical air, is higher in the day than that of the body.

Why have not the skins of tropical races a supply of blue pigment so as to exclude the red and infra-red heat rays? Nature knows her business; simple heat must run to a very high degree to do any harm. Tropical races tend to be reddish, yellow and black; it is the other end of the spectrum that their skins keep out, the blue and ultra-blue rays, actinic and chemical in their effects. These, falling through the clothing upon the spine and head, provoke the sunstroke symptoms and lower the vitality. Red clothing—which may be worn under the white—will exclude them; but why not use yellow or orange, and thus also exclude some of the heat rays? Khaki, in fact, seems to be an eminently common-sense material.

The tropical white resident forgets that in the sunlight he is exposed to a powerful natural stimulant. It is possible for him to react properly to it, use it and profit by it. But if he adds to its effects those of other stimulants, alcohol, spices, too much food and especially nitrogen, sugar—which practically means al-

cohol—and coffee, he constantly risks being overwhelmed; must in any case take great precautions, and can only do a fraction of his possible work. Let him alter his problem—how much can he eat without upsetting himself—into, how little can he eat without losing strength. A teacupful of rice may be a better meal than an unconsidered accompaniment of one.

## The Mystery of Variations

BIOLOGISTS seem to be in some trouble over the question of variations, and the differences are enough to class them into camps.

Whence the diversity of species? From variation. Are the variations very small and in need of gradual addition in the same direction generation after generation until at last the divergence is enough to warrant the labeling of new species? Or are they from the first considerable enough to warrant that? If they are very small are they of every possible kind and in every direction, or in a definite direction? If in a definite direction, does this indicate a *vis a tergo*, and if so, what kind of *vis*? Does this *vis* push upward; is its purpose, whether conscious or unconscious, evolution; or merely toward better adaptation to environment? For when, for example, bears begin to change their fur from brown to white to suit a coldening climate, they are not necessarily rising higher in the scale of being?

Lastly: does variation make for a manying of types from fewer, or a fewing of types from many?

There is mild war, for all these hypotheses have their advocates; there is a struggle for the survival of the fittest. Prediction may be folly, but we are prepared to commit it: prophesying that the finally surviving fittest of these hypotheses will be, that variations are in a definite direction, serving the purposes of evolution and of better adaptation; and that there is a conscious and intelligent *vis a tergo*.

Biologists are not unnaturally very reluctant here. To admit a *vis a tergo* seems to them the first step upon a path back to the theological fields from which science has but recently and with so much difficulty forced its way. Rejoicing in the escape, along with denial of the theological God in nature they denied nature-consciousness in nature, nature-mind, and made every process mechanical. Consequently the appearance of variations has become a problem overtaxing every application of ingenuity. Each ingenious theory rouses all the other ingenious theorists to antagonism. And there are some variations before which all the theorists have to remain silent. There is almost complete silence before, for instance, the case of the Kallima butterfly. Professor Kellogg thus describes this celebrated mimic:

These butterflies have the under sides of both fore and hind wings so colored and streaked that when apposed over the back in the manner common to butterflies at rest, the four wings combine to resemble with absurd fidelity a dead leaf still attached by a short petiole to the twig or branch. I say absurd,

for to me it seems the resemblance is over-refined. Here for safety's sake (it is simply necessary) to produce the effect of a dead leaf; any dead leaf; a brown, withering leaf on a branch. . . . But are the following things necessary? namely, an extraordinarily faithful representation of mid-rib and lateral veins even to faint microscopically-tapering vein-tips; a perfect short petiole produced by the apposed "tails" of the hind wings; a concealment of the head of the butterfly so that it shall not mar the outlines of the lateral margin of the leaf; and, finally, delicate little flecks of purplish or yellowish brown to mimic spots of decay and fungus-attacked spots in the leaf (!) and, as culmination, a tiny circular clear spot in the fore wings (terminal part of the leaf) which shall represent a worm-eaten hole, or a piercing of the dry leaf by a flying splinter, or the complete decay of a little spot due to fungus growth! A complete and sufficient seeming of a dead leaf, object of no bird's active interest, yes, but not a dead leaf modelled with the fidelity of the waxworkers in the natural history museums.

Natural selection is not, as the Professor points out, an artist working towards artistic imitative perfection just for the love of the work. But there are cases of mimicry much more inexplicable even than Kallima.

A nature-consciousness ever at work, learning through its work, aiming ever toward the evolution of life, cannot now be long denied.

## The Treatment of Cancer

DR. STOCKARD of Cornell University, writing an embryological study for the columns of the *Scientific American*, makes an interesting suggestion regarding the future treatment of cancer. Cancer, like all other tissues, consists of cells. And these cells multiply like the cells which by their multiplication finally constitute the embryo and the mature animal and plant. The rapidity of this multiplication is now known to be greatly affected by the saline contents of the watery or serous fluids in which it takes place. By change of these contents it may be stopped, delayed, or hastened. If now, he says,

we have, or know of, chemical substances which may induce an embryo to develop at a rapid or slow rate, just as some salts may cause a muscle to contract fast or slow, they may not something be found which will regulate or control the malignant growths, and perchance destroy them?

And yet there is a much deeper question. What is that power in healthy tissues which enables them to prevent the growth of elementary embryonic cells which, say the physiologists, lie scattered here and there, inactive, amongst them? It is the same which enables one man to resist tuberculosis or pneumonia while another cannot. If the medical profession had not denied the existence of the *vital essence* as a force *sui generis*, the guide of all the others, they might have been on a line of study all these years which would by now have taught them some of the deeper secrets of life and disease. To begin with that and work outward to its opponents might yield better results than to begin with the enemy and never reach at all the true inspirer of the defense, the designer and chemist.

## The Grand Cañon of Arizona

THE Grand Cañon of Arizona is one of the most amazing spectacles on this or any continent. Its very vastness prevents one at first from appreciating it properly, for everything is on such a titanic scale that we have no means of comparison. It is a great gash in the earth's surface one thousand square miles in area, and six thousand feet in depth. One stands on the edge of the fearful precipice and gazes over to the other side little realizing that it is ten or fifteen or even twenty miles across.

It is only when we fix our attention on some single feature — say, a peak or a gorge, which seems insignificant in the whole panorama and would never be missed if it were gone — and learn that this peak is higher than Mt. Washington, or yonder gorge larger than the Yosemite, that we get some idea of the grandeur of this incomparable scene. Below stretch vast silent mountain ranges worn and riven into a thousand fantastic shapes; pillars, towers, domes and arches, all glowing with unimaginable colors in the sun.

There stands an Egyptian temple; farther on a feudal keep; one fancies that there might be discovered here the prototypes of all architectural ideas that have inspired the minds of builders since the world began.

Far below, too deep to be seen in its nethermost bed, flows the Colorado river, the tenant of this abyss. Through countless patient ages it has cut its way aided by the rains and sun and wind. These attendant ministers have gone on softening, crumbling, and loosening hour by hour, and day by day, until they have carved and chiseled the living rock into its variety of forms. What lessons may we not draw from the great tireless, never-ceasing processes of Nature! Processes, in which every day counts for something and yet a thousand years is but a step toward accomplishment!

The exploration of the Colorado river by Major J. W. Powell in 1869 was one of those deeds of hero-

Lomaland Photo. and Engraving Dept.

GRAND CAÑON OF THE COLORADO

ism that make our country's history glorious. He started from Green River City on the Green River in Utah, with nine men and four boats. Everyone tried to dissuade him from such a mad project. The Indians declared there were scores of dangerous rapids and cataracts, any one of which would destroy his little fleet. There might even be steep falls of greater height than Niagara over which they would dash without warning. Moreover it was reported that the river ran underground for hundreds of miles, through what black, mysterious caverns none could tell.

But these awful tales did not daunt Major Powell — perhaps they only whetted his appe-

tite for the adventure — so he set out on May 24th. Three months later he landed at the mouth of the Virgin River, one thousand miles below his starting-point. Two boats were lost on the way and four men had deserted, being unable to endure the terrors of the voyage. It was a most perilous and difficult journey and could never have been carried out save by one of masterful courage and self-reliance. Many parties have attempted it since then, only to be destroyed.

Major Powell afterwards conducted several geological expeditions into the Grand Cañon, which was no small undertaking of itself. It has been said of him that he combined the intrepidity of the soldier with the enthusiasm of the scientist. He was one of the first to direct the attention of the world to the enormous field for geological study which this region affords. He was also a pioneer in American ethnology and made a study of the mysterious and interesting Pueblo Indians. At the time of his death he was the Director of the Bureau of American Ethnology at the Smithsonian Institute in Washington, having served in that capacity from the organization of the Bureau in 1879. It is interesting to know that Major Powell lost his right arm in the Civil War, and suffered continual pain from the wound all his life. Perhaps it was this spur that urged him on to effort and achievement — "the sting that bids nor sit nor stand, but go." BARBARA A. MCCLUNG

## Prevention of Hail by Balloons

IT was Arago who, realizing the electric nature of hail storms, sent up his "paragrêles" to conduct the electricity to earth and prevent it from accumulating, so averting a destructive fall of hail. Successful experiments to the same end have lately been tried with balloons, which are sent up with explosives attached. The explosives are fired by a time-fuse or at a given altitude. The shape of the balloons is like an inverted pear, this preventing the accumulation of water and snow on them. H.

## THE PASSING OF THE SPIRIT

Archibald Lampman

THE wind—the world-old rhapsodist—goes by,  
And the great pines in changeless vesture  
gloomed,

And all the towering elm-trees thatched and plumed  
With green, take up, one after one, the cry,  
And as their choral voices swell and die,  
Catching the infinite note from tree to tree,  
Others far off in long antistrophe  
With swaying arms and surging tops reply.  
So to men's souls, at sacred intervals,  
Out of the dust of life takes wing and calls  
A spirit that we know not, nor can trace,  
And heart to heart makes answer with strange thrill.  
It passes, and a moment face to face  
We dream ourselves immortal, and are still.—Selected

### 'The Divine Creators'

THE great message of Theosophy is *Man's Divinity*. His body is of the earth, but he himself is a child of other spheres and of celestial parentage—"Thy SELF is in itself without a body, and either praise or blame affects it not." When studying Theosophy it is needful always to keep in mind that *ourselves* and the *forms we live in* are quite distinct; that when we say "*I eat, drink, sleep, etc.*," we erroneously take ourselves to be the body; for *we* do none of these things, nor are *we* concerned in any way with the indulgence of the appetites. Neither are we the personal man with the animal instincts and selfishness. That which makes us *truly* human is our Divinity. Very true it is that with rare exceptions man does not live the Divine Life on earth; only the Greatest do that yet, those whom we know as Saviors and Teachers of men. But we, like they, are the progeny of the Divine Creators, children of the Sons of God, Children of Light.

In Theosophy there is no unbridged gap between the Supreme and man, but a long line of Spiritual intelligences from pure Spirit at the Threshold to human consciousness at the farthest confine. Life is One, and Light is One, however veiled. The more solid and concrete the vehicle, the dimmer the Light shows through, that is all. While the world period lasts there are graduated degrees of intelligence according to the grossness or fineness of the degrees of matter or substance through which it works.

Now the point of interest for us is this—at the beginning of a World-Period nature provides the Incarnating Ray of Divine Light a vehicle through which to work on the outer planes, to assimilate the experiences of a material existence, and to rebuild for itself finer and finer forms until it rebecomes the free Spirit it was in the beginning. The process of Reincarnation is the exemplification of the law of self-sacrifice and in it lies hidden the mystery of human self-consciousness and conscious immortality in Spirit.

Who then are the Divine Creators? They are the highest Spiritual Beings, the "Fathers" of the human Ego, which is a ray from themselves and also because of that divine descent *they are ourselves*. The emanations of the Divine Light possess, though latent, the same forces and powers as the highest, and as H. P. Blavatsky taught, it is for man to make use of his divine powers and create a heaven upon earth.

How can this be done? By pure, high, noble, compassionate thoughts, firstly; for as the ancients taught, "What a man thinks, that he is." All thought is creative and will ultimately manifest in action if *held to firmly*. W.

### Cycles in Life

WHEN one contemplates the heavens at night or the rising or setting sun, or the idea of the moving planets suspended in space, on one of which he lives, or the wonderful motions of these heavenly bodies in their duly ordained orbits and the simultaneous revolutions about their own axes, it is well-nigh impossible at the same time to exclude the idea of the cycle. The circle or cycle is unconsciously knit into the very fabric and being of our everyday life.

Onward progress by circuloid, cyclic or spiral motion, results by adding life to the mathematical idea of a dead circle; the certainty of our day upon night, night upon day, year upon year, the ever-revolving seasons and all other observed phenomena of planetary motion, the known history of the earth, histories of nations, the history of our own inner lives—all these have imbedded deep into our consciousness, the ever-present cycle. The moving of the One Life outward from its unknown center in ever succeeding circles of evolution and its similar inward return or involution from periphery to center again, is the most stupendous and yet the simplest complete expression of this idea.

Watching one's own life one can see the ebb and flow of tides, the recurrence of periods and similar situations, and the ever-recurrent confronting of the two-sided problem with the voice of the silence crying: "Choose, O Disciple!"

Every new year and every new day presents the student in the school of life with a fresh opportunity of building on the experience of the past little cycle, extracting its lesson by discarding that which was false and holding fast to that which was true, so that each new day is made a step upward toward that goal of Perfection, of being "made whole," which the great Galilean demanded of us. Each morning becomes a miniature New Year's Day and each New Year becomes a miniature new incarnation in which we perceive the immortal part of us trampling upon its dead selves—conquered, we hope, never to rise again to impede the progress of the unchanging Divine Self in its continuous efforts to clarify and utilize the vestures which intervene between It and the material body of earth-life which It is ever striving to reach with its effulgent Light.

Thus our inside work lies in the direction of an ever increasing purification until every organ and cell in our make-up becomes permeable by the Light that lighteth every man that cometh into the world.

Perhaps to all of us at some time of our lives comes the consciousness of periods smaller or larger in the personal life, of times of transparency and times of density. We may have periods when we are prone to health or disease, to this, that, or the other influence for good or evil. The recognition of this almost forces us to be on guard for the next time; and presently teaches us to recognize the initiatory causes on the plane of thought and feeling, to exercise our inalienable right of choice, to nip in the bud and uproot what we do not will, and to replace by what we do will, to flower in our character.

The repeated contemplation of the ever-changing must eventually bring home to us that *we* are not that, but that we are something which knows no change, no season, no time, and no revolution, but is always Itself.

H. C. B.

### Aspiration

THIS is one of the most uplifting sentiments of the human breast. It is necessary to progress. Without it, it is impossible to rise from out of the mire of human selfishness filled with its network of limitations, into the free pure, open sunlight.

So we should encourage our youth to aspire, and cannot encourage them too much. But in our so-called democratic nation there is a tendency to use this term where the term ambition belongs more properly. It is with pride that some of our educators hold before the youth the idea that he may some day become President of the United States. No matter what the obstacles of birth or fortune may have been, they are told that anyone may aspire to take the highest position in the nation.

This is, however, a method for developing ambition and not the noble sentiment of aspiration. If carried out legitimately it would lead to the life of a vulgar politician, which all clean-minded people so abhor.

It is true that simple birth and poverty are no obstacles, but the selfish desire for the first place is an obstacle, and would certainly render its slave unfit for the position, should he obtain it. Those who from humble origin have risen, have done it by being faithful to duty, by industry, perseverance, and honesty, and not by having some high honor held before them. Quite likely the desire for this possible prize has taken root in the heart of many stupid boys, too stupid to realize their unfitness, and spoiled what might otherwise have been an honest, simple career.

No place is so honorable, so desirable, so calculated to bring peace and happiness, as just the place where one belongs. And the highest honor that one can bring to himself is to fill that place *well*. In no other way is it possible to become fitted for a higher place. And those who are thinking of the higher places, are not thinking of their present duties, and so cannot possibly attend to them properly.

There is, of course, such a thing as the loss of all healthy ambition, against which the above-mentioned bait is intended to guard, but it is not a corrective medicine, for such a one can only be lifted out of his indolence by stirring some of his nobler sentiments, and not by working on his already extreme selfishness.

What they all need, indeed, is to aspire—but to aspire to do their best—and not to gain some coveted prize.

STUDENT

## THEOSOPHICAL FORUM

Conducted by J. H. Russell

**Question** We all long for simplicity. How will a knowledge of Theosophy help one to attain it, more than anything else?

**Answer** Simplicity is a name that may cover a multitude of good and evil conditions, and it will little profit a man to cultivate—shall we say its more common varieties? You desire simplicity—which way then will you go in pursuit of it? Every shade of mentality and all kinds of ideas have a simple and a complex to them, just as all foods have a hot and a cold. It is the old story—you may get lost, and wallow forever in the quagmire, going round and about, and turning and twisting till you die, and all the time not twenty yards from you, sometimes not one yard, runs the firm and solid path.

We see thousands go here and there in search of simplicity—with or without any clear idea of which kind of simplicity it is they desire—and end up at strange termini. We are not, after all, ourselves so simple of make-up, that we can go towards the first goal that presents itself and arrive devoid of regret or sense of failure. A man, as we see him, is not a unit; but a village or town or nation according to his growth, wherein all parties are at wranglement and only the dethroned sovereign holds the keys to peace. So we look for our goals, not as the king-soul within us conceives them, but after the fashion of this or that ranting demagogue. And all these may be attainable and excellent, if the king's ideal be established first, but not otherwise. One sees Diogenes' tub as the goal of simplicity, and would halt forever, at least within a few miles of its attainment; forgetting that it is not the soul which would stoop to trouble about such matters; even if he does not know that the soul demands moderation in its personality, and the avoidance of extremes. The tub may shelter a cynic, and for the despiser of men is there any peace? He must be out with his lantern by daylight, parading his own unrest. Leave your tub or die in it, that bitterness is surely a link remaining, by which you shall be drawn back into all the folly of the world. You have done with it? Then why does it trouble you? You never have done with anything, until it no longer has power to move you except to the compassion that insists on helping. The thing we hate recurs and clamors in our minds; as potent a breaker of the peace there as the thing we inordinately desire. For all the simplicity of your tub, the life of you may be all gall and wormwood; for the sun and the rain are not our only happiness and sorrow. The wild beasts' life is simple enough, but will not do for men.

Then who has not seen the man whose whole religion and aspirations are towards a simple diet? The man who goes forward to the subjugation of his body by giving it a sudden change to unaccustomed foods, chosen without regard to the other circumstances of his life, hence quite unsuitable—gets rapidly ill. Then, likely enough, he becomes a simple diet crank, with diet written all over his heart, his face, his speech; and

all his delight in patent foods and cookery, till the respect of his fellows rightly deserts him. What kind of simplicity has this man attained? Does he look sanely out upon the world? You cannot say so, for all his gaze is on his own digestion. He is swathing his mind round, mummywise, with digestion; and it would seem as if lives must pass before he can become simple and human again.

The brain-mind can invent you a thousand kinds of simplicity between your breakfast and your morning's work; and every single one of them false, and leading only to further entanglement. All moods of the mind affect the body and its health; and all ill health is a new complexity: that is to say, all untrue aspirations go to increase the complications of life. Untrue aspirations are untrue because not in accordance with natural fact and law. If we do not know the laws of nature, how can we arrive at any satisfactory condition? Physical life is not the only thing. To find the simple state for our complex, over-civilized bodies is hard enough; but we have far more than these to deal with.

This explains why the devils followed Anthony into the wilderness; and always do follow the man who retires from men to gain his selfish salvation in the solitudes. You carry your mind with you, in which the complexity lies. That complexity is fed, no doubt, by the turmoil we have built up around and without us: but it can feed very well on itself, on old visions and memories; and needs no substantial reminders—though these too have a power. But it must be controlled from within; the will must be set to controlling it. But what shall move the will? The Soul; that is, the altruistic motive: for the altruistic motive is the first manifestation that the soul gives of itself.

Base your life on so-called realism, and you are clamping it down to a dead thing, crucifying it on the cross of mediocrity, clipping—no, tearing out—its wings and hope. The urge is to go forward, and weak standing still is decay. This world and its trumpery, criss-cross happenings are baubles and insolence to the soul unless we come into them strongly with the soul's own motive of raising them up; then they become of a new significance. To march with true reality is to march with success; but to go with these petty realities (as we call them) of the personal life, is little better than crawling and tumbling like maggots in a cheese. On the other hand, base your life on a false kind of idealism, and you have set out on a wild goose chase which leads nowhither and ends nowhere. You say the world is or ought to be so and so? Have you found the way of evolution, or some by-lane into vacancy? If the former, it has made you broader, saner, more human: if the latter it has sent another of poor Earth's children off to Cloud-Cuckoo-Town, over a path inevitable, but hideously difficult, to retrace.

Now then, what will make us more humane and wholesome? Look round, and see if it is not altruism that is needed. Theosophy brings home to us the unity of life; shows that to fight for one's own hand is to fight towards suicide, and the deeds that pay are the deeds done for humanity. Is not that simple enough; setting one goal up for all our efforts, instead

of the myriads we have now? And Theosophy shows what the construction of a man is, and how the different parts of him can be brought into harmony, so that no energy is wasted; and sets forth an ideal of simplicity which comprehends all our nature, inviting and giving work to heart, will, mind, and imagination: shows that no true simplicity can come unless the lower mind, with its desires and tendencies, is in its right place as servant of the soul, and deposed from its present captaincy and devisership of plans. It shows that the confusion in the mind is the root of all the confusion in life, and that in there is the place where we shall do well to begin our efforts. L. J.

**INQUIRER.** You spoke of "animosity." If truth is as represented by Theosophy, why has it met with such opposition, and with no general acceptance?

**THEOSOPHIST.** For many and various reasons again, one of which is the hatred felt by men for "innovations," as they call them. Selfishness is essentially conservative, and hates being disturbed. It prefers an easy-going, unexact *lie* to the greatest truth, if the latter requires the sacrifice of one's smallest comfort. The power of mental inertia is great in anything that does not promise immediate benefit and reward. Our age is pre-eminently unspiritual and matter-of-fact. Moreover, there is the unfamiliar character of Theosophic teachings; the highly abstruse nature of the doctrines, some of which contradict flatly many of the human vagaries cherished by sectarians, which have eaten into the very core of popular beliefs. If we add to this the personal efforts and great purity of life exacted of those who would become the disciples of the *inner* circle, and the very limited class to which an entirely unselfish code appeals, it will be easy to perceive the reason why Theosophy is doomed to such slow, up-hill work. It is essentially the philosophy of those who suffer, and have lost all hope of being helped out of the mire of life by any other means. . . .

**INQ.** All this refers rather to the ethics and philosophy of Theosophy. Can you give me a general idea of the Theosophical Society, its objects and statutes?

**THEO.** This has never been made secret. Ask, and you shall receive accurate answers.

**INQ.** But I heard that you were bound by pledges.

**THEO.** Only in the *Arcane* or Esoteric section.

**INQ.** And also, that some members after leaving did not regard themselves bound by them.

**THEO.** This shows that their idea of honor is an imperfect one. How can they be right? As well said in the *Path*, our Theosophical organ at New York, treating of such a case: "Suppose that a soldier is tried for infringement of oath and discipline, and is dismissed from the service. In his rage at the justice he has called down, and of whose penalties he was distinctly forewarned, the soldier turns to the enemy with false information—a spy and a traitor—as a revenge upon his former chief, and claims that his punishment has released him from his oath of loyalty to a cause." Is he justified, think you? Do you not think he deserves being called a dishonorable man, a coward?—H. P. Blavatsky, in *The Key to Theosophy*

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Creeds

THE more one reflects on the importance the Christian Church has placed upon creeds, the more one marvels. And the power it has had to impress this importance on the minds of the multitude is yet more marvelous. The only explanation which seems in any way to account for the facts, is that originally, the impulse was started not by any friends of Jesus the Christ, least of all by Jesus himself, but by powerful enemies of the human race, that is to say by selfish minds who wanted to rule, and that thereafter, although the word "creed" implies thought, there has been but little real thought in this direction. To throw such an idea over the minds of the people was like throwing the apple of discord, and those who did it must have known it.

The folly of binding one to a creed seems so evident, that any simple, natural mind surely can see it. Who is there who cannot look back on his beliefs of twenty, ten, even one year ago, and see how limited they were, and what honest, aspiring mind would be willing to say: "Now I have arrived at the end, and will fix my thought." How small must be the little brain which fancies it can bring down the mighty issues of life and formulate them to fit itself.

There are a few propositions which are expansive, being universal, which the church might have asked candidates to agree to. Such are, a belief that they are souls; that they are responsible for their acts and thoughts; and a belief in the unity of the race. This would have been a good start, at least. But let anyone read the creed insisted upon by the church, and ask himself, honestly, whether if he should endorse every word of it, he would in any way be improved; whether he would be better fitted to fill the duties of life; or be better fitted to meet death. The church creed does not ask its followers to promise to work for self-control; to deal honestly; to live justly; it does not even ask them to love one another, which their Christ said included everything; it says nothing about self-sacrifice; but after asking them to believe in one God, it chiefly turns its attention to asking them to believe in just one Savior, who by special favor belongs to them. There is nothing inspiring or helpful in that creed. They might have fash-

ioned one that would be, and yet not have succeeded in lifting the race. There are devils who hold much higher creeds than that! But the test is not in what one believes, but in what he is.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

## The Religion of Sensible People

IN recent numbers of the *Hibbert Journal* we have an account of "The Religion of Sensible Scotsmen," and of "The Religion of Sensible Americans." These articles will be followed by an account of the religion of "sensible people" in other countries. The idea which has given birth to these articles is probably something like this: There are many people who are behind the times, who try to satisfy their souls on the orthodoxy which was a power two or three centuries ago; also, there are many people who are eager to follow any new teaching, people who may be called fad-dists. But there is a large class of people that cannot be called rigidly orthodox, nor yet are they ready to take up any new thing; what is the religion of these sensible people?

To the student of religions the thought will probably occur: is this idea of getting a religion out of the respectable average of humanity a wise one? Is it according to history? What great religion ever sprang up on middle lines after this fashion?

That Scotsmen are sensible goes without saying; and that they were, and probably still are, religious, no one who knows anything of the land of Knox will deny. And, though the days of the old Covenanters are gone, their descendants, the Reformed Presbyterians, still exist, and even in America form a by no means insignificant body in the Eastern and Middle States. The strange zeal which possessed them in the days when the Earl of Angus raised his contingent from the West Country Whigs (it is still known as the Cameronian Regiment) — when the captain was expected to "confess his sins at the head of the regiment," says Macaulay — that zeal has not quite vanished

even in America, for the Reformed Presbyterians refuse to take part in politics until the United States Government "casts out the unfruitful works of darkness." In Scotland the "Disruption" days of 1843 are not forgotten; and, lest religious fervor should wane a "heresy hunt" is started now and then.

Yes, the Scotsman is religious by

instinct. Not long ago it used to be the boast that the physical and intellectual vigor of Scotsmen could be accounted for by the fact that they were "brought up on oatmeal and the Shorter Catechism."

The Scotch character presents not a few difficulties to the stranger. It is often said that Europeans cannot understand Asiatics; but who could have expected to find in the homes of even the Free Church, or the Covenanters, the Westminster Confession of Faith and Burns resting side by side in peace on the same shelf? Then the Scotch, notwithstanding their orthodoxy, have more than any other nation, perhaps, translated and absorbed the writings of the great German thinkers, not only in philosophy but in religion also. Again, this nation, which has been so conservative in matters of religion, has in national affairs been most uniformly and tenaciously liberal. Hence, when such an able writer as William Wallace, L. L. D., editor of the *Glasgow Herald*, speaks of "The Religion of Sensible Scotsmen," one expects to find an important subject treated with rare ability. The article becomes all the more interesting and important because it is followed, not long after, by another very able paper from the pen of President David Starr Jordan of California, on "The Religion of the Sensible Americans." The managers of the *Hibbert Journal* appear to be desirous to hold up before the world those types of religious thought which are judged by able men to form the religion of sensible people.

To the Theosophist any such attempt must possess an especial interest, for various reasons. It tends to remove the things which separate various religions, and to put in a clear light the things which may form the ground of a common agreement. But there are certain elements lacking in this religion of "sensible people" which the Theosophist regards as very vital. The lofty ideal; the insight that lays hold of the Real; the consciousness of the Divine Self within, these, which

are the life and soul of religion, do not stand out very prominently in that practicalness, or pragmatism, which is especially held up to our view by Dr. Wallace, and which Professor Jordan distinctly names as the characteristic of "The Religion of the Sensible American." There is, indeed, very much more of the mystic in the American than in the Scotsman as expounded by these two writers.

"The Religion of Sensible Scotsmen," according to Dr. Wallace, is a religion which looks to the practical side of things, and is not nearly so much concerned with dogmas as one might suppose. It seeks to shun the falsehood of extremes. It holds to the past more in the spirit of respect than of positive belief. The sensible Scotsman "would not pronounce himself either a Calvinist or an Arminian." He does not trouble himself much "about Fate, Free-Will, or Foreknowledge Absolute." He no longer regards the use of instrumental music in church worship as the thin end of the wedge of atheism. He thinks that what has been handed down to him through so many ages must not be lightly cast aside: it must have something in it. Dr. Wallace questions if Carlyle is altogether right in saying that the industrialism of Scotland has brought it about that the hell which Scotsmen fear is "the hell of not getting on." Instead of this, he thinks, "To the Scotsman of a speculative turn of mind, who is, however, central-minded, the 'hell' means rather a breaking away from the community of a great and noble tradition." The religion of the sensible Scotsman leads him to take an interest in civic life; and, if well-to-do, he will probably be a "member of the Town-Council, the School Board, or one of the Committee of an Infirmary or Hospital." He says:

Scotland has long ago ceased to be priest-ridden, even in the sense and to the extent which Buckle's unconscious humor has rendered immortal; but it has no objection to be presbyter-guided.

The sensible Scotsman takes more interest in social reform than in sectarian disputation. And the "submerged tenth"—which he fears is very nearly one third in such a city as Glasgow—is the Banquo's Ghost that haunts all his feasts."

According to Dr. Wallace, the sensible Scotsman is he who

tries to secure a subjective basis for his objective life; to discover a moral Cosmos in the apparent chaos of environment; to subject temperament to the control of a will purged from selfishness; and to cast off, not only every weight and the sin that doth so easily beset him, but who also seeks to change the small habits which often prevent and always delay the accomplishment of great ends.

When we turn to "The Religion of the Sensible American," by Professor Jordan, we find the same practical aspect which Dr. Wallace exhibits in "The Religion of Sensible Scotsmen," but in addition to this there is more of the ideal. America, from the very facts of its vastness, its newness, and its multi-form composition, must be radically different in spirit from a small Presbyterian country like Scotland. In every new country the physical problem, of a living comes first; and that develops the practical element of our nature; but if dwelt upon too much or too long there is a tendency to materialism. We then create

for ourselves an atmosphere which shuts out the stars.

Professor Jordan bases his paper to a considerable extent upon the teaching of a former friend, a "Sensible American"; and he believes that this view of religion, though not complete, "is not far from the ideal to which the average sensible American of today is clearly tending." The sensible American feels that "this is God's world, none other more so."

Our fathers were born here, and our fathers' fathers and the same Hand has led on from the primordial sandstones of Quebec to the foundation of our own Republic. The pledge of the future is adequate. . . . Wisdom is knowing what one ought to do next; virtue is in doing it; and religion is the feeling or attitude which braces us up to do our duty when it is easier to stand aside or to let the part assigned to us slip by through default.

Professor Jordan again refers to the teachings of his friend, whom he quotes as the typical American:

It is not faith in God that men need, but faith in themselves. Faith in self—faith that links God and man, and is the key to all the riches of heaven—is the result of experience.

His friend, he says:

used the word God freely in his talks with young men and women. With him God was not a mere abstraction, but a very potent element in the bond of events, the great First Cause, and the Last Cause of things as they are. His God was not anthropomorphic, not "made in the image of man," nor "should it justify Haeckel's sneer at worship of a 'gaseous vertebrate.'" It is only in mythology and poetry that God appears as angry, jealous, benevolent, a judge, a tyrant, a king, a huge hoary-bearded giant.

The sensible American is more in touch with the Christ of the Gospels than with the Christ of theology. To him the words are not true because Jesus said them, but he said them because they were the truth, "and one name of divinity is the Perfect Truth." "To the average American the creeds are mostly harmless. They will not injure us if we do not read them!" The sensible American is "not alarmed over the results of the Higher Criticism. Enough that is genuine and beyond question goes back to the teachings of Jesus." He is prepared to grant that some things may be parable, or poetry, or an error of record, but his faith in Jesus Christ is not touched by any of these things. Professor Jordan says:

The religious philosophy of the sensible American has long tended in the direction now ticketed by philosophers as Pragmatism. Whatever will work in the conduct of life, strengthening it, enriching it, giving it a higher trend, must so far as it goes, have elements of truth. If it were not true it would not work.

The sensible American values emotion only so far as it results in action. "Love is not love unless it contains the impulse of renewed life."

Emotions are dangerous things unless they find an outlet in action. We can so narcotize ourselves with holy things that our senses will lie to us.

Again he says:

Exercise the angel; do not try to exorcise the devil. No animal lives for itself, or is allowed to live for itself, Nature executes drones.

To the sensible American "God" and "im-

mortality" are not things to be "proven," but to be felt, to be realized:

If you have risen to that height where you feel sure you know God in this world, and in your life, and in the lives of your fellows, be very sure that you know your own immortality.

In the limits of this short article it is impossible to do full justice to Professor Jordan's paper. Several of the stories or parables, especially that of the "Holy Shadow," are worthy of a place in classical literature. The aspect of the sensible American towards religion might be summed up in the words of the great Swedish seer: "All truth leads to good. All religion has relation to life. The life of Religion is to do good."

In concluding, Professor Jordan again quotes from his friend, saying:

In proportion as man's life is identified with things that change and decay is his faith weakened. But if one's ideals are in the realm of character, death is not one of their attributes. . . . Only he who loves lives. Wisdom is vain unless our knowledge is turned into love. Love for man—and this soon passes into love for God—lifts man above the physical where death is, into the spiritual life everlasting.

Such is a very hasty sketch of Professor Jordan's article on "The Religion of the Sensible American." One can only say, if all people were but "sensible Americans," and their religion such as Professor Jordan pictures it, there would not be any need for jails or police courts, or even for an army or navy—the Golden Age would be here. And though it does not give us the wide scope, the extended horizon revealed to us in Theosophy, the Wisdom-Religion, as to man's nature and destiny, still it makes for righteousness, and for unity; it tends towards harmony and the brotherhood of humanity. (Rev.) S. J. NEILL

#### Clipped from the Press

TO any person who is at all interested in the better life of the here and the now, as well as of the life to come, we recommend the perusal of literature sent out by the Theosophical Society of Point Loma, San Diego, California, as being the highest and best procurable. This Society, under the leadership of Katherine Tingley is making rapid strides in the religious world of the day, attaining a following of the best educated minds in the world. The teachings are not crude, but contain such substance as only those who are willing to study and study hard can appreciate. The teachings are practical, involving no legends, being based on facts as can be observed in the today, and in the readings of evidences left of the past. Whether a person be religiously inclined or not he will find the literature highly interesting, as it has to deal with one of the most absorbing topics of the day, including science, archaeology, ethnology and palaeontology, all of which are set forth so clearly as to be beyond the confines of a doubt. Your name and address will bring a sample copy of their paper, the CENTURY PATH, one of the best printed publications in the world, and each number handsomely illustrated. Also, the society has just issued from the Aryan Theosophical Press a handsome portfolio illustrative of the beauties and life at Lomaland, near San Diego. This magnificent specimen of the printing art can be procured for fifty cents. It will interest you from beginning to end.—*Republican*, Truckee, California

For thoughts alone cause the round of re-births in this world; let a man strive to purify his thoughts.—*Mitrâyanî-Brâhmanâ-Upanishad*

### The Theosophical Schools in Cuba

TO MRS. TINGLEY:

The following are a few general considerations upon the progress of your work in the Râja Yoga Schools and Râja Yoga Academy of Santiago de Cuba. "Each growth or evolution has its moment, its crisis, which is shown by its decadence or its progress; moments which are the signs of the times." At this time Râja Yoga is exactly at this crisis, at this stage of growth, in Santiago, and it is my duty to describe it.

To feel it as I feel it you must understand its history; and it is therefore necessary to repeat certain facts although they are already to a great extent well known. When Katherine Tingley arrived in Santiago that city could scarcely be called a city; it was a collection of poorly built houses; its inhabitants were sorrow-stricken and hungry (the result of the war), and tyranny and misery had reduced them to a state of absolute indifference. To understand the state of affairs at that time it must be remembered that the number of deaths in the city, which under ordinary circumstances were about three daily, at one period rose to 108 in one day.

Katherine Tingley and her workers, reached Santiago at that time. They came with hearts full of compassion and they succored many, but Katherine Tingley in her wisdom knew that after giving all the material aid that was necessary, it was indispensable for the future welfare of Cuba to educate and direct into the right path the children who were ultimately to be the citizens of the Cuban Republic. Knowing that the future depended upon the children she concentrated upon that work some of her best efforts.

When misery is the dominant note, when all extend their arms to receive, it is impossible to make a selection in the general confusion and pick out the best children; it is no time to make distinctions.

One of the results of these bad conditions has been that all kinds of obstacles have interfered with the civilizing work of Katherine Tingley. I have said that the obstacles placed in her path at Santiago are due in a great degree to the state of moral degradation into which the people of the city had fallen. It is necessary to mention this as it is the reason for a certain mistrust that grew up against Katherine Tingley among a few unimportant people. But it was not the only cause of their lack of faith and doubting attitude, for it was largely the work of certain North American newspapers and a Methodist minister, a Missionary, then in Santiago who attacked Katherine Tingley, and she was slandered. The Missionary went from house to house urging the families to reclaim their children; frightening the parents with horrible stories which were also circulated in printed pamphlets. Therefore all the blame cannot be put upon the condition of the people of Santiago, for America did the most of it.

But enough of this: judging things as they have always been, comparing some of the facts with other facts, and knowing how much insistence on retraction costs; if everything had gone smoothly, if there had not been difficulties, it could not have been proved that Katherine Tingley's work was a sanctified work, divine and just. But as what I am now going to say may seem over-praise, let us not forget

that Jesus suffered in order to place the foundation-stone of his building of peace and of love, and to spread his doctrine. What reformer could escape the inevitable persecution and calumny? While at this time reformers are not crucified in the material sense, they suffer a moral martyrdom as the result of slander and calumny, which is worse than death. Mrs. Tingley's work in Santiago was, and is, a good work, a just work, a work of highest equity. How, therefore, could it escape the inevitable persecution that all such work must suffer?

In the Province of Santiago the Râja Yoga School was established with Cuban children, good and bad. The work which had been started at Point Loma was first extended to Santiago, and the School there was the first one established on the same lines as the one at Point Loma.

When a nation is at peace and undertakes great works such as the building of great edifices and railroads, these are hardly perceived by other nations, and they do not exert any great influence on humanity although they are the unfolding of great ideas. But when there is a struggle between two nations, even though they are small, to unfold a great idea (because all wars no matter how painful they may be bring with them a great idea which can be implanted in the nation and the general life be awakened), the eyes of the world are fixed upon them; opinions differ, parties are formed, and enemies and friends arise everywhere for one side or the other; and the sentiments which are adopted are imprinted on their minds and brought forth from their hearts, and they adopt the principles for which they fought; hence this opposition to Mrs. Tingley's work has been inevitable.

Bear in mind that there is, even now, among the enemies of Truth a constant opposition against her in the United States, which from time to time sends its echoes to Cuba. Our Cuban press has ceased to publish reports that come this way, and the enemies' work now passes like the gust of wind which disappears with the same rapidity with which it came. We are at a period of reaction; we are on the eve of a splendid victory.

Let us refer again to history. There is a place at Santiago called San Juan and many attempts have been made to purchase it but no one was able to secure it but Katherine Tingley! Without the last "Crusade," two great battles could not have been won — Pinar del Rio and San Juan. How strange it is that the place where the last battle was fought in the island of Cuba against all kinds of tyranny is the place where the great battle for freedom and justice is to be fought by your Theosophical Leader.

When Katherine Tingley first visited Kettle Hill it is said that she knew then that the land would come into her possession, although the owner had refused to sell year after year, first to the Cuban Government, then to the Municipality, and then again to the United States; saying that nothing would induce him to part with his property because he considered it his duty to preserve it and that no amount of pleading or even threats to take away his property by force would change his purpose; and he maintained firmly that he would not sell it.

But Mrs. Tingley came and saw the land

and said "It must be ours!" and although I thought it would be useless to approach the owner again (feeling sure that he would refuse to sell), I went to see him, and to my great surprise, I had hardly broached the subject of the purchase of San Juan when he agreed to sell 100 acres. He received me with cordiality, and after the basis of the contract was arranged we remained the best of friends. So, this man who at first was so obstinate changed in an incomprehensible manner; San Juan which before could not be purchased by others has come into the hands of Katherine Tingley. Now who does not see in this fact the evidence of a great victory?

Since the property became Mrs. Tingley's it has trebled in value; the road which formerly was bad has been made anew by the Government; the marsh lands have been laid out; good large buildings have been erected, and the electric car passes almost by the very gate of the new Point Loma. Still we have not finished; for, lastly, an iron bridge has been built across the San Juan river as if Providence had said to Mrs. Tingley, "Thou hast reached the end of thy task; thou lackest little to give it all its splendor: take the bridge and pass the last difficulty."

The opportune moment has arrived for the erection of the building at San Juan. The Academy is waiting; the sun of Râja Yoga is rising. It is necessary to grasp the opportunity, that boys and girls of good families may enter the ranks of the students. Already Râja Yoga is known by its excellence. After so much calumny and slander it is natural that there should be many doubting Thomases who need to see to believe. But now, even the newspapers which were unfriendly praise Râja Yoga; one may be specially mentioned and that is *La República*. At one time this paper was most bitter in its attacks upon Katherine Tingley and her work. When a person is seen walking properly, talking correctly, and going through the streets in an orderly manner, it is said: "There goes a 'Râja Yoga,'" and when one corrects another, the one who does not want to hear interrupts, saying: "You also have become Râja Yoga!"

Good people ought to be unswayed by the bad; nothing and no one should make them desist from their purpose of following the path for the benefit of humanity; and the path followed for the benefit of humanity ought to carry them forward although they may stumble and fall sometimes. Were it realized without sacrifice, it would not be a great and glorious ideal. To redeem evil doers, it is necessary to be a redeemer, and you cannot be a redeemer without suffering, without pains and tears and sacrifices. Goethe when dying, exclaimed: "Light, light, more light," and to Humanity we also exclaim: "May they have Light, light, more light." More light is needed where there is darkness, not where the sun and the stars are always bright. To uplift, educate, and correct, even though it be against the will of the individual, is the great mission of the International Brotherhood League.

The last suggestion is of something very symbolic. Jesus had a St. John of his doctrine, and may not the San Juan of Santiago be the precursor of brotherhood to all parts of the world? EMILIO BACARDÍ. (Translation) July 13, 1908

# Art Music Literature and the Drama

## The Music of the Flute

PROBABLY the first authentic mention of the flute is found in the archaic myth of Pan with his Pipe of seven reeds, symbolic of the septenary forces of nature, but from the earliest times and in nearly every country the flute has been a popular instrument. In Ancient Egypt it was used in the sacred ceremonies of the Temples, combined with the lyre and the harp, and Demokritos mentions that many diseases were cured by the skilful use of the melodious tones of the flute.

It may be that the violin is the most expressive of all the instruments, its position is closest to the heart; and the organ may be the grandest; but the flute has a place all its own and ranks high. It is almost closer than the violin and the breath that awakens and shapes its brilliant tone is warm and charged with life; the instrument becomes almost as obedient to the will of the true artist as the voice-box and the vocal cords themselves. In the hands of a fine player it is a pliant soul-instrument, expressing the most subtle shades of feeling, but the extreme difficulty of mastering the technique prevents it being often heard to advantage. Ordinary clever and conscientious flute-players rarely touch the soul, but when a genius has conquered the mechanical difficulties he has a great opportunity of evoking the highest music.

Händel was the first in modern times to make the flute an essential part of the orchestra. Haydn uses it with telling effect in the Dead March in *Saul*. In Lomaland the study of the flute is an important part of the musical training given in the Isis Conservatory of Music, and it is interesting to note that the Japanese have a high appreciation of the instrument. In old days the Samurai were encouraged to practise it in order to ameliorate their warlike ardor, and today it is very popular in the army and navy as well as among the people. One of the leading commanders who subsequently won high honors before Port Arthur, in leaving his well-loved flute, his *shaku-hashi*, with a friend as a keepsake, expressed a profound understanding of the virtue and potency of the instrument by saying: "Into this I have breathed my spirit and there can be no truer memento of me." EUTERPE

THE magnificent collection of musical manuscripts belonging to Ernest von Mendelssohn, nephew of the great composer, has been presented to the Emperor and will henceforth rest in the Berlin Royal Library. Among other things this priceless collection contains the original score of Mendelssohn's Concerto, one of the great concertos of the world; the original MSS. of three Beethoven Symphonies (the well-known C minor, the fourth and the seventh); and several quintets and trios. H.

## Reclothing Beethoven

A NEW YORK music critic mentions a composer of his acquaintance who intends to go to Europe to study instrumentation with Richard Strauss, and who, having brought himself up to date, will re-orchestrate Beethoven's Fifth Symphony! The master's lines of expression are too simple, too stern and elemental (!) they need softening, elaborating, embroidering!

This is a sermon in itself, a commentary on the times.

Those who have best seized the spirit of Beethoven will not count him as a man "sent," a man with a message. He had doubt-

Then he will have his right to be a "messenger" of the light he has reached. There are as many paths to the light as there are men, and this was his.

Beethoven stands apart from almost all other musicians because of his sustained yearning after a definite event in his consciousness—the entry of that light which brings peace, the Gnostic light of the new birth. He connected the ideal to which he aspired with the power to bless humanity and to bring it knowledge of universal solidarity. The Ninth Symphony was as near as he ever came to a message. He could tell what he *desired*, and the intensity of his desire; but he could not tell what he had *attained*, for one more supreme effort was necessary to crown his life. And *that*, his life did not give him time to make. Perhaps his death did. When he is on earth again, we shall hear something, perhaps the message complete. STUDENT

## The Music of the Future

A N American has just presented a vault to the French Government, excavated in the cellars of the Grand Opera House of Paris. It contains the necessary arrangements for the permanent preservation of phonographic records of the singing and instrumental playing of all the chief virtuosi of today. The disks are of suitable material; an instrument that will make them vocal once more is enclosed with them; the receptacles are hermetically sealed; and they are all to lie undisturbed for fifty years, to be then opened by permission of the Minister of Fine Arts of that day.

What changes may not have happened in fifty years! The music of today may have become hardly endurable in its simplicity. Some more harmonics may have been translated down into an octave that will contain quarter tones like the music of the Greeks, or intervals of even lesser magnitude. The tempered scale may have been outgrown; new and now unimaginable instruments may have replaced those we now use. Let us remember that our music is but a few hundred years old; quite lately, as it were, has it reached its present form. It is regaining a past not quite forgotten. The music of some of the Indians of today is a mere relic, yet recent official study of it has shown that it is as complex in its melody and harmony as our own. From what has it descended and *retrograded*?

The question is interesting; we are climbing the hill they have come down. Here is food for speculation if one must speculate, though it were better still to bend one's energies to helping forward the higher musical life of the present day, lifting it as best we may to grander, purer heights. "The world shall be filled with music"—yes, when we do our share towards that sublime end. STUDENT

## CHARACTER

EMERSON

THE sun set, but set not his hope:  
Stars rose; his faith was earlier up:  
Fixed on the enormous galaxy,  
Deeper and older seemed his eye;  
And matched his sufferance sublime  
The taciturnity of time.  
He spoke, and words more soft than rain  
Brought the Age of Gold again:  
His action won such reverence sweet  
As hid all measure of the feat.

less seen the great light; he was forcing his way up the steep ascent towards it. He was in the storm and the struggle. His keynote was yearning. Sometimes his feeling almost blinds him with its intensity; sometimes the storm subsides to a gentle and even playful melancholy. But one knows that the immense power of the man will sometime carry him to his triumph—perhaps has now done so.

ONE of the poets has said, "Hope springs eternal in the human breast."

There is always the germ of hope in the lowest and meanest, but it is so covered over with the accumulation of worthless things that there is need to rake and clear away the rubbish before the seed can sprout and grow. We accumulate and save so many things that are not only useless but positively harmful that the storehouse of the mind is overcrowded. Instead of being filled with pure and wholesome thoughts of how best to benefit mankind, of the pure joy of making others happy, the mind is cumbered with no end of sentimental trash labeled "Compliments I have received," "Sights," "Personal pleasures," "Grievances," "Fears," etc. We take them out of their wrappings one by one with longings and sighings — *but* we put them carefully back again; they are altogether too dear to part with.

Our Leader, Katherine Tingley, has said "Life is Joy!" and life, real life, is a living near to nature, not the artificial kind of existence that so many of us lead in a vain pursuit of happiness for self, but one of honest endeavor, whose days are filled with duties well performed and self-sacrificing devotion to the welfare of others. There is a higher life for those who overcome the delusions of selfishness. Sorrow and despair are unnatural because they originate from selfishness. When death takes a loved one from our view, do we mourn for the one gone because we fear he will miss *us* or be unhappy? Never. To us he is in perfect peace, he is happy. It is always for ourselves we mourn, for we fear that *we* may be unhappy in missing the loved one — and there are some, it must be confessed, who seem determined to be so.

The duty of mankind is to help to raise the lower kingdoms, and it is only by right living that we can do so. Our philosophy teaches that man's influence affects the lower kingdoms of nature. There is an old saying

## The Gospel of Hope

among farmers, "You cannot take out of the ground what you do not put in," which is really only another version of "What ye sow that also shall ye reap." If we plant not the

### SONNET

Vittoria Colonna, Italy, Sixteenth century  
(With Metrical translation by a Lomaland Student)

**D**i gioia in gioia, d'una in altra schiera  
Di dolci e bei pensier, l'amor superno  
Mi guida fuor del freddo arido verno  
Alla sua verde e calda primavera.  
Forse il Signor, fin che di molle cera  
Mi vegga il petto, onde 'l sigillo eterno  
M'imprima dentro nel più vivo interno  
Del cor la fede sua fondata e vera,  
Non vuol con l'aspra croce al sentier erto,  
Ma col giogo soave e peso lieve  
Condurmi al porto per la via men dura:  
O forse ancor, come benigno esperto  
Padre e maestro, in questa pace breve  
A lunga guerra m'arma e m'assecura.

From joy to joy doth tender love supernal  
And thoughts benign, from one to other legion,  
Guide me from arid cold of winter's region  
Into the warmth of spring and greenness vernal.  
Mayhap the Master seeth me, and beholding  
My breast as wax whereon the seal eternal  
Hath graven deep a faith profound, supernal,  
Thus my heart's faith within His own enfolding,  
Willeth to lead me not by grievous winding  
Bearing a cruel cross, but with weight little  
And burden light to kindly haven sendeth:  
Or haply Father, Lord, and Master, finding  
Need for to better arm me for the battle,  
The present peace and respite to me lendeth.

seeds of love, of joy and hope, can we expect to reap the harvest of sweet content? Emerson says "Nature is loved by the best in us. It is loved as the City of God," and to those who love nature it brings a feeling of the

reality of the eternal, a nearness to God, to the Infinite. Under the soothing influence of nature we lay down the care and turmoil of our lives, and we feel the meanness, the pettiness, of the struggle for place and power, and the futility of the mad race for wealth that when gotten never satisfies. And at last we turn back and lay our weary bodies down, glad with the knowledge that on the breast of dear old Mother Nature we will find the peace and rest that in life's vain quest for happiness we failed to find.

What the world needs today is more of the spirit of hopefulness. We need to root out the germs of fear and despair which breed a host of miseries for mankind, as "like breeds like," and let joy beget joy. The kingdoms of nature, mineral, plant, and animal, are striving to reach upward to the Divine, and it is man's duty to help them, a duty that if neglected will bring misery upon himself.

Too long has man groped amid the dark shadows of hopelessness and despair brought about by his violation of the laws of nature. Has not our Leader said, "What a mighty change would come to the world if men and women of means and influence would find their strength and heart life and begin to work consciously to kill out vice and in its place plant love." Let us clear away the rubbish from our minds, drive out the false notions, the selfishness and unbrotherliness that have so long filled the rooms with their filthy presence. Let us open the windows and doors that the pure air and the sunshine and the joy of life may come in and dwell with us. Then will our hearts be attuned to nature and there will be room for the song-bird of Hope. Then will we find that side of our natures wherein dwelleth contentment, the "benevolence, tenderness and complacency" of which Patanjali tells us. Still more, we shall develop a capacity for impersonal service in helping mankind, and than this what earnest soul could ask more? STUDENT

### Our Desires or Our Duty

IN every life there is more or less of a conflict between these two. Some never realize the strength and peace that come from the performance of duty until they have so long yielded to inclination that their whole nature has become lax and feeble, and they wake up at last and perceive their condition—their powerlessness to resist impulses and desires, their sickening vulnerability to fleeting impressions, and the tendency to lose self-control because of any untoward circumstance. They realize at last that it is time to change all this, to climb out of this helpless state and return to the path of duty.

There are many stages in this downhill progress towards doing only what one likes to do. Every stage is recorded upon the person. Fretful, fearful, expectant looks, the ever-present desire and demand for consideration, the restless search for excitement and stimulus from without, are all manifestations of the state which exists when the moral nature receives no current of vitality from the performance of duty regardless of personal inclination. Weakness of this kind does sometimes afflict sincere people for a time, and it is the awakening of such from the awful lethargy of thinking they must *like* to do things, which those who truly love them try to bring about.

What a diversity of desires pursues those who are in this unfortunate condition! They cannot hear of a book without wishing to read it, of a place without wanting to see it, of a desirable possession without determining to have one like it. They create a confused atmosphere, a whirlpool in which they are condemned by themselves to live. If their nerves be not racked and their physical health undermined, as it often is, their moral strength is depleted, and when suffering rouses them they are often well-nigh shattered.

For all such the return to systematic, impersonal, faithfully performed work for others is the tonic needed. Will and efficiency have to be strengthened and built up again by exercise along the normal lines of human development. A consistent effort must be made to gather in the desires that have flown so far afield and re-consecrate oneself to the great purpose of life. The result is renewed peace, though not the peace that once was or ought to have been experienced, for it must hold a reminder, a guardian born of the determined renunciation of the desires that once dethroned peace. Part of the lesson to be learned is true vigilance. STUDENT

A DESPATCH from Berlin states that the career of women as motor cab drivers has come to an untimely end. The last one of the original number who applied has resigned on the ground that she did not possess sufficient physical strength for the arduous work, and previously a number had had their licenses revoked for the same reason. Nature, after all, seems to have something to say in settling the vexed problem of "woman's rights." H.

### "When Even You Have Failed"

THE fearless warrior, his precious life-blood oozing from his wide and gaping wounds, will still attack the foe, drive him from out his stronghold, vanquish him, ere he himself expires. Act then, all ye who fail and suffer, act like him; and from the stronghold of your Soul chase all your foes away—ambition, anger, hatred, e'en to the shadow of desire—when even you have failed.

This is a quotation from a little book dear to the hearts of all students of life, *The Voice of the Silence*. It is one of the priceless treasures left to humanity by H. P. Blavatsky—gathered by her from fragments of ancient wisdom and translated for those who are asking the way of life.

A YOUNG RĀJA YOGA GIRL OF SWEDEN  
NOW A STUDENT IN THE RĀJA YOGA ACADEMY OF LOMALAND

Standing with reluctant feet  
Where the brook and river meet,  
Womanhood and Childhood fleet.

It is only for those who believe in the Soul, who are at last beginning to recognize that they *are* Souls, and that all experience is for the Soul. He, in whom this recognition has dawned, knows that he is deathless; that there is naught to do but renew the struggle, naught to do but conquer, and he is not daunted by failures. And he who is permeated with this knowledge feels all minor desires sink away before the one great desire, to further the purpose of the Soul. And this purpose is so stupendous that only in long ages can it be fully accomplished—innumerable bodies the Soul must pass through and overcome ere the goal is reached.

In the wonderful story of Prometheus is depicted the soul's endurance, the chains by

which it is bound—chains which can only be loosened when the man has evolved himself into a Hercules. So in this titanic struggle there must be failures which are countless, yet the only real failure is to yield—and for this there is never need, for the soul is stronger than all these foes. It is but necessary to call this to mind, to remember that the greater the temptation, the deeper the feeling of discouragement, the grander is the opportunity for victory. It takes ages to become a Hercules, but each moment may score the victory which leads to this,—which is the only part belonging to the moment. And it is not only those who walk erect, supported by approval and applause, who carry the palm. He who is bleeding and torn, who walks by the roadside unnoticed, may be holding it more securely. It belongs to him who, though having failed, has arisen in faith and courage. STUDENT

### In the Japanese Home

WRITES John La Farge in his recent book, *An Artist's Letters from Japan*:

I have spoken of simplicity. The domestic architecture is as simple, as transitory, as if it symbolized the life of man. You can see it in all the drawings, in the lacquers, and it has recently been treated completely in the charming book of Professor Morse. Within, the Japanese house is simplicity itself; all is framework, and moving screens instead of wall. No accumulations, no bric-a-brac; any lady's drawing-room with us will contain more odds and ends than all that I have yet seen together in Japan. The reserved place of honor, a sort of niche in the wall, the supposed seat of an ideal guest, has upon its bench some choice image on a stand, or a vase with elegant disposal of flowers or plants, and above it the hanging roll with drawing or inscription; perhaps some other description or verse, or a few words on a tablet upon some cross beam, and perhaps a small folding screen. Otherwise all works of art are put aside in the fire-proof storehouse, to be brought out on occasions. The woodwork is as simple as it can be, occasionally some beautiful joinery; always, when it can be afforded, exquisite workmanship; and above all exquisite cleanliness. For there are no beds, only wadded coverlets and the little wooden pillow, which does not disturb the complicated feminine coiffure in the languors of the night. No tables; food is laid on the cleanly mats, in many trays and dishes. No chairs; the same mats that serve for bedstead and table serve for seats, with, perhaps, a cushion added.

And this is all and the same for all, from Emperor's palace to little tradesman's cottage. There is nothing apparently, but what is necessary, and refinement in disposing of that. The result is sometimes cold and bare. There is the set look of insisting upon an idea, the idea of doing with little: a noble one, certainly; as, for instance, when the Emperor's palace at Kioto is adorned merely by the highest care in workmanship and by the names of the artists who painted the screen walls. It is possible that when I return I shall feel still more distaste for the barbarous accumulations in our houses, and recall the far more civilized emptiness persisted in by the more esthetic race.

Those who know best and honor most the inner Soul of Japan know that when the best of Japan's life is joined to what Theosophy has to give, the world will pause to look. H.

# OUR YOUNG FOLK

## Up The Nile

**A** TRIP up the Nile from Cairo as far as the first cataract is generally made in large steamers, with all the comforts of a first class hotel, but many tourists prefer to travel by Arab dhows or in one of the flat bottomed boats used on the Nile, called dahabiyehs.

As we leave Cairo, across the level plains rise the Pyramids of Gizeh, their rich tawny color shining like gold in the sunset glow. Here and there a native village with minaret or mosque and a cluster of palms meets the eye against the yellow limestone, and always canopied by the deep blue sky.

In the summer the country around is flooded, canals and dykes carrying the water where it is needed; then, as it subsides, rich crops of rice and corn begin to appear, water melons cover the islands, and the tamarisk groves are fresh and green.

Many of the temples in the Nile valley can be seen from the river; others are within easy walking distance. The rock-hewn tombs and caves covered with hieroglyphic inscriptions, many of them richly colored, are still in perfect preservation after the lapse of thirty or forty centuries. The sphinxes, sometimes carved out of one solid piece of rock, and the great pylons or tower-like walls at the entrance of the temples, were built to defy the hand of time. The clear dry atmosphere, the sand and alluvial deposits all help to preserve these marvellous monuments.

Some of the most ancient tombs and pyramids can be seen at Memphis. Those at Denderah and Esneh were of a much later period; here Greek and Roman architecture have left their mark, blending with the solidity of the Egyptian.

Thebes represents the central period of Egyptian art. It was built on both sides of the river and a flight of steps leads up from the bank to these ruins. First comes the stately temple of Luxor. Here are the two helmeted colossi of black granite, and an obelisk of red granite, highly polished and covered with superb hieroglyphics. The twin towers of the great propylon with sloping sides and cornice on the top are sculptured to represent Rameses II victorious over his enemies. Luxor was connected with Karnak by a mighty avenue of sphinxes. The great court of Karnak is more or less ruined but its por-

tal and hall of columns stand, stately and grand. Its walls recount the great deeds of Thotmes III in his struggles with Assyria.

A dahabiyeh can go up past the first cataract. The shellâli or cataract Arab with a troop of Nubians, drags the boat up various side channels by means of ropes attached to the islands. Farther up we come to the sacred island of Philae where is a temple dedicated

**I** COUNT this to be grandly true;  
That a noble deed is a step toward God  
Lifting the Soul from the common sod  
To a purer air and a broader view.—J. G. Holland

to Osiris with graphic pictures of his death and resurrection. But beyond all and above all is Abu Simbel. Here the great Rameses took a mountain to sculpture into a temple. The entrance was dignified by four giant figures carved in the solid rock, sixty-six feet high as they sit. The hieroglyphs tell that "Rameses the strong in Truth made this divine abode for his wife Nefertari" and that "Nefertari who loves him made this abode for the king in the mountain of pure waters." The temple is a whole library and picture gallery bringing vividly before us the history of Rameses. As we wander in these sculptured halls within the mountain, before the holy shrine and the statues of the gods, there falls upon us indeed, as nowhere else, the weird spell of ancient Egypt. E. L. W.

ARAB DHOWS ON THE NILE

## Facts Worth Knowing

WILD silk is produced by an insect which lives on the leaves of oak trees in Manchuria. The Chinese manufacture pongee silk from this wild product.

A CURIOUS insect found on the stems of roses in South America is so like the thorns that make these stems prickly that the difference between them can scarcely be detected.

A LIFEBOAT has been invented which has the double advantage of taking up less room on the steamships than the kind now used, and of serving as an unsinkable raft when thrown overboard. It has sides which can be opened out and closed at will.

THE largest bridge ever built over the Nile near Cairo has just been finished. It crosses the river from Cairo to the island of Rodah which is said to be the place where "Moses was found by Pharaoh's daughter." Part of the new bridge opens to give a clear passage to ships, and it is 1700 feet long.

THE U. S. Department of Agriculture is about to introduce the native rushes of China and Japan into the United States. These are less brittle than the American rush and hence more useful, and may be grown in marsh land not otherwise utilized. New industries will follow, as these rushes can be used for a considerable variety of useful purposes.

# THE CHILDREN'S HOUR

## WONDERFUL

Julian S. Cutler

ISN'T it wonderful, when you think,  
How the creeping grasses grow,  
High on the mountain's rocky brink,  
In the valleys down below?  
A common thing is a grass-blade small,  
Crushed by the feet that pass,—  
But all the dwarfs and giants tall,  
Working till Doomsday-shadows fall,  
Can't make a blade of grass.

Isn't it wonderful, when you think,  
How a little seed asleep,  
Out of the earth new life will drink,  
And carefully upward creep?—  
A seed, we say, is a simple thing,  
The germ of a flower or weed,—  
But all Earth's workmen, laboring,  
With all the help that wealth could bring,  
Never could make a seed.

Isn't it wonderful, when you think,  
How the wild bird sings his song,  
Weaving melodies, link by link,  
The whole sweet summer-long?  
Commonplace is a bird, alway,  
Everywhere seen and heard,—  
But all the engines of earth, I say,  
Working on till Judgment Day,  
Never could make a bird.

Isn't it wonderful, when you think,  
How a little baby grows,  
From his big round eyes, that wink and  
blink,  
Down to his tiny toes?  
Common thing is a baby, though,  
All play the baby's part,—  
But all the whirling wheels that go,  
Flying round while the ages flow,  
Can't make a baby's heart.—*Selected*

RAJA YOGA CHILDREN IN THE GARDEN OF THE ACADEMY, LOMALAND, CALIFORNIA

## Nature's Song---Helpfulness

"I LIKE to do things my own way," said little Molly Brown to herself. "I think it is a nice way," and as the teacher passed on she continued to write with her elbow stuck out, and her pen held very badly.

Next day the teacher was ill and a well-loved visitor to the school and friend of the teacher's took her place.

"Miss Geraldine is ill, and I shall take her place for a few days," Miss Mary told the children. "I once taught little girls too, so I know all about how copy books should look. Let me see yours each in turn, dears," and she put on her spectacles and began with Charlotte's book.

"Very good," she said, "painstaking, and neat"; to the next, "rather shaky, but fair"; and so on until she came to Molly and then she shook her head.

"Very careless," she said, "blotted and untidy, from your fingers I see. I am sure Miss Geraldine never taught you to hold your pen like that."

Somehow, Miss Mary's kind, keen eyes took all the bravado out of Molly, and she felt how silly she had been, and blushed up to the roots of her hair as she walked back to her place. Then Miss Mary began to talk about the flowers, telling such wonderful stories about

their beautiful colors, shapes, and perfumes, and their insect friends, and how one helped the other.

Then she asked, "What do you think would happen if flowers, bees, and butterflies refused to do their work? Would not the world be much less beautiful than it is? No flowers unless the plant puts forth its buds; no flowers unless the buds listen to the call of the sun and open, and if no flowers, no fruit, no honey, no sweet scents, no busy bees. Nor would the fruit and seeds in many cases form, were the busy, beautiful insects idle or careless. Nothing good or beautiful can ever come, *where there is neglect of duty*. Never forget that children, for it will save you many wasted, unhappy hours. Do you think the birds and the bees and the flowers work their "own way," or Nature's way? Don't you think dear Mother Nature is a wise teacher, and her children follow her teachings and advice, and that is why they grow so well, and all is harmony?"

The children's bright eyes answered her.

"Who can tell me what is a little girl's work?" she asked.

"To become good," replied Charlotte shyly; they were not used to such questions.

"Surely," said the teacher, with a smile, "and bright, and clever, and capable, earnest, loving little helpers in a weary old world that

needs you badly just now to teach your fellow children that "*Life is Joy*" when we learn how to live properly. And now for a song. Come, I will teach you a new one:"

Come to me, give me your service  
Great seeds by small hands are sown,  
By Nature's dear children close to her heart  
Doth Harmony come to be known.

Soon the sound of sweet singing filled the room and floated out through the windows carrying with it hope and cheer from the children's hearts. E. I. W.

## Almost too Late

A STORY is told of a fourteen-year-old boy who went camping in the Adirondack Mountains prepared to do some hunting. He had a new rifle and canoe, and one day he started out with a guide. As they were paddling along near the shore of the lake a rustling of branches caught the boy's ear and, looking up, he saw the head of a deer. The animal, which was hastening to the lake for a drink, did not see the hunters until with a sharp turn it stood face to face with them. The boy raised his rifle to fire, but the beautiful soft eyes of the deer looked into his and he could not bear to do it. He dropped his rifle and the deer escaped. Perhaps this lesson will keep him from ever again being almost too late. G.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis  
Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

## Lengthening Life

IN an article called "Lengthening the Span of Life," in *The World's Work* (London), are the following remarks:

What is it that causes a senseless unconscious bit of life-producing putty—protoplasm—to *Move*? Why do the pale and sickly shoots, growing from potatoes in a dark cellar, reach toward the only light that comes through the cellar door? . . . What is the apparent intelligence that causes newly hatched chickens, with absolutely no experience, to move unerringly to food?

One would suppose that the fact that the protoplasm, the shoots, etc., behave in this way was sufficient evidence that they *have* sense and consciousness of a kind. But the writer seems to prefer to assume first that they are senseless and unconscious, and then to cast about for an explanation of their sensibility and consciousness. This is one way of reasoning.

Why must protoplasm be senseless and unconscious putty? What reason for so regarding it is there so strong that it can overrule the more obvious inference that protoplasm is sensible and conscious? Why, in order to explain the life and intelligence of a thing, must we first assume that it is dead and unintelligent?

The probable answer to these questions is that some minds have a mania for trying to reduce everything to the two elements of immaterial force and dead matter, the one acting on the other.

But no dead matter has yet been found, the minute particles even of chemical solutions being found to be in a state of continual rapid motion, and the atom itself being a little cosmos of whirling worlds. Neither has science yet detected any force that is not indissolubly associated with a vehicle which they must fain call material. Indeed, if such a force were detected, it would not be able to move anything because its lack of mass would deprive it of all energy.

So one must characterize this idea that protoplasm is senseless inert putty, and that its activity is due entirely to the action of a force from without, as a scientific *dogma*, precisely similar to that theological dogma which first makes man sinful and then attributes his goodness to an external power, or separates the Creator from the creation, the human from the Divine, and Religion from life.

A potato sprout reaches out toward the light. Therefore, says the common-sense person, it

is alive and (to a degree) intelligent; we need not suppose it is intelligent as a man, as a horse, or even as a jelly-fish; but it is intelligent enough for its purpose. But the above writer seems to argue thus: the potato cannot be intelligent; therefore it must be impelled by something else. To take another case. We see a trained animal doing mental feats which are unusual in that animal though less difficult than many things it does normally. We begin by assuming that the animal cannot do those things of itself (because ordinary untrained animals do not do them); and then we have to invent a hypothesis to account for the facts—unconscious signalling, fraud, anything rather than the simple explanation which would commit us to an admission we are reluctant to make. Or, again, a newly hatched chicken behaves intelligently; but it cannot be intelligent; therefore, what is it that makes it behave intelligently?

The writer speaks of all developed organisms as being *built up* of elements, and of the scientific necessity for analysing them into these elements. The elements are supposed to be simple and more and more devoid of properties as we analyse farther. Complexity results from the aggregation and interaction of these simples.

But the facts, as discovered by science itself, seem to warrant an opposite conclusion. The cell, the nucleus, the nucleolus, the atom, the electron—all these seem to have more power and intelligence than anything that is subsequently derived from them. Not finding the essential properties in the structure, we throw them all back upon the element, until the element, be it atom or cell, becomes the bearer of all burdens.

When an organism breaks up into smaller forms, the process is called "decay"; but might we not just as well call the process of building up a process of decay? and the process of dying as a return from the phenomenal world to the more real world behind it?

When a Soul is born into this world, it dies from another world. When it casts off its mortal life, it returns to the fuller life it enjoyed before. Death and birth are terms as correlative to each other as are light and darkness, heat and cold.

The tendency of biological thought along the lines at present under consideration seems to be about as follows. Life is a name for the activity that is produced when certain forces act on dead unintelligent matter. These forces are perhaps electricity or chemical affinity or some form of these. Therefore perhaps we can

The Total Illogicality of Modern Reasoning

Life is Universal and Eternal

prolong life and arrest death by introducing such forces into organisms. As far as theory goes, we are no better off than those older biologists who regarded life as a "vital force"; because we have merely replaced that vital force by other forces as mysterious. But practically, and in so far as one may experiment with things without having a definite theory as to their essential nature, we have reached a new field for research.

Unstable and  
Adaptable  
Outward Forms

We can stimulate plant growth by electricity, colored light, and chemical means; we can check fermentation in animal bodies by antiseptics. One biologist is said to have modified the conditions of reproduction in certain lowly marine organisms by the use of saline solutions.

One point made is that we must find out how to make the *constructive* ferments in our bodies keep ahead of the *destructive* ones. But though we may succeed in staving off death for a few years by such methods, we shall find ourselves opposed to a far stronger force than any that can be dealt with chemically. *The will to die!* As Solomon and many another Sage have said, man clings to death by clinging to forces which are mortal and destructive. So long as he is bound to the animal propensities and desires, he binds himself upon the wheel of terrestrial life and must follow its short cycle.

Sleep, hunger, weariness, may all be staved off for a time; but in the end we must yield and pay compensation. So with death; it is

The Greater is  
Within and  
Contains All  
the Outer

neither possible, nor would it be at all desirable, to prevent it by such methods.

But there are wiser methods by which life may be made healthier and of more normal length than at present. In proportion as we get away from animalism, selfishness, and other such "destructive ferments" (so to say), and gravitate towards the sublimer and more enduring attractions, so shall we refine and strengthen our lives.

### The Mysterious Nature of Comets

EVERY day the problems in astronomy are increasing in complexity and interest, and the astronomer who wishes to do original work must not only have mathematical and observational ability, but a large knowledge of chemistry, physics, electricity, photography, etc.

One of the most fascinating and puzzling questions of the day is the cause of the singular action of the tails of comets. During the time that a comet is far from the sun it shows little or no vestige of a tail; but as it approaches the intense forces concentrated at the center of our system, the tail is thrown out and rapidly lengthens, until in some cases it reaches the enormous length of a hundred million miles, or more. The most curious thing about this appendage is that it invariably points *away from the sun*, whether the comet is approaching our luminary or receding from it. The cause of this defiance of the law of gravity has remained obscure until lately, when an electric theory was brought forward which partly met the difficulty; and now a highly speculative theory of light-pressure has been worked out by Professor Svante Arrhenius of the Nobel Institute.

And yet there is nothing new under the sun, for in 1619 Kepler propounded a hypothesis that the tails of comets were formed through the repulsive action of solar light, but at that time light was held to be a subtle form of matter. When the undulatory theory—that light is merely a trembling of the ether of space—became generally accepted, Kepler's idea was thrown aside; for how could the ether, which passes through the densest bodies, exert any pressure upon the tails of comets or anything else?

Still the comets' tails continued to point away from the sun, and some explanation had to be found. According to the modern theory of electricity, the negative electrons repelled from the sun at the rate of about 100,000 miles per second attach themselves to the gaseous molecules surrounding the head of the comet, charge them negatively, and cause them to be repelled in the direction opposite the sun, thus forming a part, at least, of the visible tail. Until the comet approaches near the sun there can be no tail so formed because there is no gaseous envelope produced far out in the cold of space.

The electric theory not being complete, Professor Arrhenius has attempted to show that the direct pressure of light is the missing factor, or one of them. Even in the 18th century inconclusive experiments were made to decide whether light does exert any appreciable pressure, and over thirty years ago Clerk-Maxwell came to the conclusion that it must do so, notwithstanding its supposed non-corpuscular nature; and lately the Russian Lobdev, and the Americans Nicholls and Hull, finally proved the question experimentally. The earth, for instance, bears a pressure of about 75,000 tons.

Now Arrhenius considers that the dust particles (not the vapor) of which comets are supposed to be partially composed, are minute enough for the light-pressure of the sun—small as that pressure is—to affect them, and to drive them away into outer space. So that this stream of particles, illuminated by the sun, and in conjunction with the electrically repelled vapor, is the cause of the familiar appearance of the tail. This explanation does not clear up the difficulties presented by the supplementary tails, and the jets thrown out in front that some comets produce; they must arise from a repulsive action within the head of the comet itself, not yet known, but evidently excited by the proximity to the sun.

The theory of light-pressure is of course being worked to its utmost capacity, and has been applied to the problem of the zodiacal light, the mystery of the gaseous nebulae, etc. Whether time will fully justify these speculations or not, the hypothesis itself is interesting, and certainly partially true. To the Theosophist it is of interest as a new proof of the nature of light and as a confirmation of the ancient teaching—antedating Pythagoras—that light is ponderable, whether corpuscular or not. H. P. Blavatsky devotes a large amount of space in *The Secret Doctrine* to the metaphysical and physical aspects of light. In one passage\* she writes of—

That infinite Ocean of Light, whose one pole is pure *Spirit* lost in the absoluteness of Non-Being, and the other, the *matter* in which it condenses,

\* *The Secret Doctrine*, Vol I, p. 481

crystallizing into a more and more gross type as it descends into manifestation. Therefore matter, though it is, in one sense, but the illusive dregs of that Light whose limbs are the Creative Forces, yet has in it the full presence of the Soul thereof, of that Principle, which none—not even the "Sons of Light," evolved from its ABSOLUTE DARKNESS—will ever know. The idea is as beautifully, as it is truthfully, expressed by Milton, who hails the holy Light, which is the

... Offspring of Heaven, first-born,  
And of th' Eternal co-eternal beam;  
... Since God is Light,  
And never but in unapproached Light  
Dwelt from Eternity, dwelt then in thee  
Bright effluence, of bright essence increate.

STUDENT

### The Pressure of Light

THE "pressure of light" is written about in *Harper's Monthly*, and the writer states that this amounts to 75,000 tons on the earth's surface, which works out at about .00019 grain per square foot, so we manage to bear up under it.

This force, however, minute as it is, is regarded as producing many large effects on a cosmic scale. The theory seems to have proved a perfect treasure for explaining the hitherto inexplicable in regard to comets and other celestial matters. Why does a comet's tail, in defiance of the sun's enormous gravity, drift away from the sun? The light pushes it away. Then how does light come to surpass gravity? The explanation is that light acts on the surface of bodies, whereas gravity acts on their mass; and that by subdividing a body into very small particles, you can increase the area of its surface enormously without increasing its mass. Hence the smaller you divide it, the larger becomes the surface in proportion to the mass, and the more does the pressure of light count as against the force of gravity. Now comets' tails are composed of the minutest possible particles, constituting the thinnest kind of a mist; and the surface of these tails being so enormous in proportion to their weight, the light gets in more work than the gravity. The tails are, as one gathers, *blown* into space by the sun's light.

A very small force acting on a body may produce a very large acceleration in that body, provided the mass of the body is sufficiently minute. And if the force continues to act, the velocity continues to be accelerated.

This is the explanation up to date of the phenomena mentioned. How long will it be before a better theory is evolved? STUDENT

### Halley's Comet and the Bayeux Tapestry

HALLEY'S comet was looked for last winter by photographic plates at the Royal Observatory, Greenwich, but without success, its position being in the Milky Way. Elaborate calculations have also been made to ascertain the circumstances of its next return and to check the dates of its past appearances given by Dr. Hind 50 years ago. The probable date of next appearance is April 8, 1910, somewhat earlier than had been supposed, and too near the sun to make a good showing in northern latitudes. This comet appeared just before the Norman Conquest; and contemporary accounts and the Bayeux tapestry give a vivid impression of the sensation it produced at that time. T.

# Some Views on XXth Century Problems

## Civilization by Alcohol

IN the columns of a monthly contemporary Professor Münsterberg suavely pleads the case for the moderate use of alcohol, the case against prohibition. That he makes the best of it goes without saying. But how bad is the best! What omissions, what fallacies, it needs!

His argument begins with an admission:

The evils which are connected with the drinking habit are gigantic; thousands of lives and many more thousands of households are the victims every year; disease and poverty and crime grow up where alcohol drenches the soil.

After this begins the case.

Railways kill and maim thousands a year. Do we, he asks, on that account propose to prohibit them?

How much crime and disaster and disease and ruin have come into the lives of American youth through women, and yet who doubts that women are the blessing of the whole national life?(!!)

The case *against* alcohol might almost be allowed to rest on the advancement of such an argument *for* it! Alcohol, like woman, is "the blessing of the whole national life"; like railways, it is a vital necessity of civilization! If the implication is not that, what is it? The next point is that the prohibition laws will be evaded and broken. Let us avoid making laws that will be broken. But why not then repeal the laws against theft and burglary? We cannot ensure universal respect for them. We know they will be broken.

There is a growing feeling, says the Professor, against the eating of meat, and against the medicinal use of drugs of any kind. Are we, he asks, to prohibit these by law? And if not why prohibit alcohol?

When it is proved, as it is for alcohol, that the moderate use of meat, and the skilled administration of medicines by physicians, shorten life; that a single dose of either dims all the senses and lowers intellectual acuteness; that they hinder work of every sort; that they are a constant temptation to their own increase and that when this is yielded to they wreck the whole human and finally even the animal nature; that they are the chief cause of crimes of violence, and that in districts where they are abolished the criminal courts have their work halved — when this is proved for them we will consider their prohibition.

But the gist of the argument follows: "Alcohol has indeed an inhibitory influence on mind and body," but inhibition is a normal function of physiological life.

There is not the slightest act of attention which does not involve such inhibition. If I read in my study, the mere attention to my book will inhibit the ticking of the clock in my room and the noise from the street, and no one will call it harmful.

He means, will inhibit *attention* to the ticking and the noise. When the day's work is done and the time for recreation is come, it is good, he argues, to inhibit the mind, by means of a little alcohol, from further occupation with business matters.

But the turning of attention from noises in the street to the matter of a book is *not* an inhibition; it is not a *staying* of consciousness but the mere assumption by consciousness of a new direction of work; its activity is as keen as before. So is the recreation which takes the place of business worry. And the mind which, in order to recreate in the evening, has to inhibit its worries with alcohol, has also to pay, the next morning, the price of the drugged inhibition. There are of course physiological inhibitions constantly taking place in our own bodies, but they are part of the normal mechanism of the machine. But inhibitions effected by alcohol are induced from *without*; they are comparable to the flinging of handfuls of sand among the wheels of a machine. Certainly it *will* go slower! And the same argument for alcohol would also apply to the similar use of morphine, cocaine and haschish.

The final argument is that alcohol produces emotionality. "Better America inspired (!) than America sober." Stop alcohol and we stop emotion, and "with the emotion dries up the will." America became great through her will, therefore through her emotionality, (!) and as this rests on alcohol, or as alcohol is a necessity for the fulness of this, America became great through alcohol!!

Let us Americans remember that the article is by a man of another nation and be charitable about it. He even goes on to say: "that in almost all parts of the globe even religious life began with intoxication cults." Shades of the great Teachers of humanity!

God Indra was in the wine for the Hindûs, and Dionysius for the Greeks. It is the optimistic exuberance of life, the emotional inspiration which alcohol brought into the dulness of human days, and the history of culture shows it on every page.

On the contrary it was the introduction of the evil twins, alcohol and sexuality, into the sacred rites of antiquity that extinguished their purity and degraded the solemn rituals into vile orgies. And even if it *were* true that religion originated in alcohol, must it stand by alcohol? It is sometimes said that music originated in the beating of tom-toms. Should we add the tom-tom to the instruments of modern orchestras?

We thank the Professor for his article. It might almost be reprinted as a prohibition pamphlet.

## Heaven by Hypnotism

THANKS to the church therapy movements, hypnotism bids fair to become a religion. The peace which is offered is a facile and agreeable substitute for the Peace of God. Struggle against sin is an old-world method; now you lie at repose in an armchair, and without effort on anybody's part your sins peacefully glide away into nothingness. Says the recent manual of this vestry hypnotism:

I place the patient in a comfortable reclining chair, instruct him how to relax his arms, his legs, his

neck, his head and body, so that there shall be no nervous tension or muscular effort. Then standing behind him I gently stroke his forehead and temples, which has a soothing and distracting effect. . . . I then tell him that all nervousness is passing from him . . . that he is *entering into peace*. . . . I personally attach a religious importance to this state of mind. When our minds are in a *state of peace* . . . I believe that the Spirit of God enters into us, and a power not our own takes possession of us.

It does; the personality of the operator, *his* spirit, announcing itself as the Spirit of God! A dose of morphine will give exactly the same mental and physical restfulness; will the Peace of God ooze in by that door also? But in a few days the effects of the physical poison are gone; those of the psychic poison are not. The drench of a foreign personality is not so easily recovered from. But as, when the calm of the morphine is over, the original pain stands out more sharply than before; so, when in a few months or years the cloud of this psychic morphine clears away, the man will find himself facing his original difficulties, but with less ability to deal with them.

But *what am I to do?* asks the man who thinks he cannot conquer for himself some weakness. Well, first, a wrong path is not better than no path. But there *is* a path. The Peace of the soul, or of God, is to be had in no long time by him who daily feels after it. When in the silence some touch of this benediction from within is felt, let the failing be quietly called up and looked at, looked at again and again from the new position *above* it. Look *down* on it in the consciousness of power to overcome it. Every time that is done, power has grown. And if against all stumbles and failures that process is repeated, if the help of the divine part, the soul, the witness, is daily invoked, final success is certain. The man will have immeasurably strengthened, not paralysed, his will; he will have taken many steps towards ideal manhood; he will have become profounder and wiser in mind than he now deems possible; and he will perfectly realize for himself why hypnotism, whatever its immediate and outward results, would have reduced him to the rank of a pauper, spiritually alms-seeking and powerless.

It is doubtless useless to suggest to the operators that for every case upon which they work, they are probably sowing or nourishing a poison plant in their *own* natures, as well as *assuming a responsibility farther reaching than they can conceive*. Those who have the Peace, who have found the Path, can show others the way. But the church method presumes to *stun them into half consciousness* and then try to carry them — which shows how much of the Path the practitioners themselves know!

There is today a widespread and correct intuition that man's consciousness can push on to a new light in whose radiance perplexities will vanish. The error comes in deducing from that intuition that *any* alteration of consciousness will do. But it is the sole will and aspiration of the man himself that the great step needs. Steps imply *effort*. STUDENT

## Door Guardian,

### Anurādhapura

EVERY flight of steps in the ancient city had these Door Guardians, which stood at the lower termination of each balustrade. They are all similar in pattern, with but slight variations; carved in high relief and having smaller symbolical figures at the feet. The Dvārpāl here shown stands guarding a flight of stone steps near the stupendous monument known as the Jetavanārāma Dagoba, which was built by King Mahāsena and his successor Sirimeghawanna about the close of the Third century A. D. B.

## The Sphinx in America

ON the Mississippi between Alton and the mouth of the Illinois River, the Piasa Creek empties into the Mississippi; and at its mouth, on a sandstone cliff, at a height of 80 feet above the river, there were in 1673 and until the middle of last century two carved and painted representations of a monster known to the Indians as the Piasa, the man-devouring bird.

Father Marquette said of them in 1673:

"As we were descending the river we saw high rocks with hideous monsters painted on them, and upon which the bravest Indian dared not look. They are as large as a calf, with heads and horns like a goat; their eyes are red, beard like a tiger's, and face like a man's. Their bodies are covered with scales; their tails are so long that they pass over their heads and between their forelegs, under their bodies, ending in a fish's tail. They are painted red, green, and black. They are objects of Indian worship."

A writer in *Records of the Past* gives other accounts of them and the Indian legends about them, and then asks what is their significance.

"Was this bird-serpent, with its half-human face, a combination of the thunder-bird and lightning-serpent, in which all the Algonkin tribes believed? . . . The Kwataka or Man-eagle of the Mokis, carved on the rocks near Walpi, Arizona, closely resembles the Piasa of Illinois, having the same

position, wings elevated, body covered with scales or arrow-markings, head round, with feathers or horns on the top, legs with three talons, and in one claw it is grasping a serpent-like animal which it seems about to devour. . . .

"The thunder-bird myth extends from the Atlantic to the Pacific, and from Behring's Straits to the Isthmus of Panama. There is a great serpent-mound in Adams County, Ohio, many bird-mounds in Wisconsin, and many thunder-bird mounds on the coast around Puget Sound. Mound-effigies, pictographs, petroglyphs, tattoos, and textile representa-

in one of the representations described above the monster was devouring a serpent-like animal. It represents, among its meanings, the great powers of interior nature which Man has to conquer and by which, when conquered, he can conquer all lesser powers.

The fact that this symbol was known all over ancient America and survives to this day in connexion with a host of ill-understood legends, is proof of the former world-wide diffusion of the Wisdom-Religion of antiquity, with its marvelous and profound symbolic language. STUDENT

Lomaland Photo. and Engraving Dept.

DOOR GUARDIAN OR DVĀRPĀL, ANURĀDHAPURA, CEYLON

tions of the thunder-bird and lightning-serpent are found among the Micmacs of Nova Scotia, the Ojibwas of the Great Lakes, the Sioux, etc.

"... In all human probability the image with the face of a man, the wings and claws of an eagle, and the tail of a serpent, carved on the rocks at Alton, was the great thunder-bird or storm-spirit of the Illinois."

A pen-and-ink sketch of this emblem, made in 1825, which is figured, represents the monster as having four legs—not a characteristic of bird, serpent, or man. It has wings, a human face with horns, and the tail is many-jointed—like that of a scorpion. Under these circumstances it is not difficult for the student of symbology to recognize that world-wide (not Egyptian only) symbol compounded of four creatures and often known in the Eastern world as a sphinx. These four components are the Man, the Bull, the Eagle (or Scorpion), and the Lion. They correspond to Aquarius, Taurus, Scorpio, and Leo, and to the "Four Mahārājas" of the four quarters in ancient Āryan philosophy. They are mentioned also in *Ezekiel*, and the Red Men have much symbology connected with the four quarters.

This fourfold symbol is so universal and its meaning is so profound and far-reaching that to study it means that one must study the whole question of ancient Science and its symbolical notation. In many old Persian and Assyrian carvings, the King is seen slaying such a monster;

# The Trend of Twentieth Century Science

## Normal Starvation

A PHYSIOLOGIST has suggested that ideal old age would correspond with a painless, and even agreeable, normal starvation. Coincidentally with the lessening of the power to digest and assimilate food, is a lessened demand for it from the cells of the body, caused by and in turn causing lessened activities. The three factors would go so perfectly together that there would be neither pain nor uneasiness.

But, arguing from cases of actual starvation, and from such cases as that of Gladstone, in which an enfeebling body brings about no mental enfeeblement, he goes on to suggest that in normal life as it passed into old age and on to extinction—normal having, unfortunately, to mean rare—the brain would not share, or would share but little, in the lessening of activity or in nutrition. Whilst digestion and absorption were being effected at all, that is, whilst any life persisted, the brain would have first service of the results and would remain well nourished while all else was enfeebling. It would therefore—though the physiologist naturally stops at this point—remain alive for some period after the rest of the body had actually ceased to live; and for that time its contents of memory would remain at the disposal of the departing conscious soul.

According to Theosophy, the departing soul has a good deal to do with those contents during that brief period between the departure of life from the body and its departure from the brain. A great Teacher of Theosophy is thus quoted by H. P. Blavatsky:

At the last moment, the whole life is reflected in our memory and emerges from all the forgotten nooks and corners, picture after picture, one event after the other. The dying brain dislodges memory with a strong, supreme impulse; and memory restores faithfully every impression that has been entrusted to it during the period of the brain's activity. . . . No man dies insane or unconscious, as some physiologists assert. Even a madman or one in a fit of delirium tremens will have his instant of perfect lucidity at the moment of death though unable to say so to those present. The man may often appear dead. Yet from the last pulsation, and between the last throbbing of his heart and the moment when the last spark of animal heat leaves the body, *the brain thinks* and the EGO lives, in these last few brief seconds, his whole life over again. Speak in whispers, ye who assist at a death-bed and find yourselves in the solemn presence of Death. Especially have ye to keep quiet just after Death has laid her clammy hand upon the body. Speak in whispers, I say, lest you disturb the quiet ripple of thought and hinder the busy work of the Past casting its reflection upon the veil of the Future.

According to this fragment of Theosophy, then, the brain remains alive during a period extending between the last beat of the heart and the final cessation of animal heat. And physiology vaguely points to this great fact in suggesting that in ideal old age bodily death would leave the brain still prepared to function, still in full nutrition. Physical nature provides for a necessity of the soul, the necessity of surveying the just closed life. STUDENT

## Pragmatic Geometry

PRAGMATISM in philosophy was preceded a good while by pragmatism in geometry. The symptoms are the same in both cases. The man whose eyesight will not permit him to see outlines sharply, proclaims that things *have* no sharp outlines. The pragmatist has the same defect in the eyes of his philosophic consciousness.

Pragmatic geometry is known as the neo-geometry. Parallel lines may meet or may not meet; we cannot say; possibly they may do both or neither. If we assume that they do meet, or that the three angles of a triangle are less than, or greater than, two right angles, and the consequences when reasoned out look pretty and interesting, then our assumption was correct. But tomorrow the other assumption may seem to yield still more interesting conclusions and will then be correct.

This geometry, and pragmatism, are symptoms of the mind of the age. A profound mind might confess its inability to grasp the final truth, but it needed a Twentieth century mind to throw its inability outward and assert that there is no absolute truth and fact of things.

We conceive as best we can of two lines which do not meet. *Not meeting* is therefore the definition of our word parallel. We then let go the conception and it alters into a conception of two lines which *do* meet. Not noticing the alteration we say: Behold! these lines which do not meet also do meet! It is clear to the man of common sense that the mind which tries to work thus may be extremely ingenious but lacks virile grip on its own creations. The "new geometry" is in fact a symptom of mental indefiniteness, inability to grasp and hold steady.

A contributor to a philosophical contemporary, tilting at the new geometries, includes the fourth-dimension speculations in the area of his target. Space may be measurable in three ways only; but the people who think it may be measurable in four are at least clear and honest thinkers, not trying to juggle with incompatible conceptions or unable to see that incompatibles *are* incompatibles. They are really reaching out in the attempt to find truth, in the belief that truth, that absolute facts, do exist.

Without following them in their attempts to conceive—that is, find—another dimension in space we can very rationally try to conceive of other spaces. What we call space is space with respect to objects visible, tangible, or movable. But *silence* would be space with respect to hearing, a sound-emptiness. Still another space would be mind that had succeeded in discharging itself of all the stirrings and blendings we call thought and was holding itself ready for the reception of, or birth in itself of, an altogether higher order of cognition and activity. After the ceasing of very lofty music, for example, there is not only a space with respect to sound, but a very tense space with respect to thought, a space identical with a plenum. The ancients held that between

two of the acts of the great drama of the universe, the stage was cleared; the *mind* of the universe became space and in that space dwelt deity. When the new act began, that space filled with thought and with light, with living beings and their life. All the spaces are aspects or degrees of that primal space.

STUDENT

## Disease by Anarchy

A VOLUME containing seventeen papers, representing work done under the Collis P. Huntington Cancer Research Fund, has just been published and may be reckoned to be the last word of medical opinion.

There is no bacillus or other parasite known as standing in a directly causal relation to cancer. Any seat of constant irritation, or any long standing local disease, may become cancerous. But the associated bacilli are then merely part of the irritation and may disappear when the cancer supervenes.

On the whole the report inclines to the theory of "cell autonomy." Either normal cells break loose from the general body economy and start vigorous multiplication on their own account; or some primitive germinal cells, still remaining here and there among the masses of higher cells that have evolved from them, suddenly break out into useless developmental activity.

The nervous system cannot keep order. Cancer is local anarchy.

The practical upshot of the report is a recommendation of the early use of the knife. Nearly all surgeons are agreed about that, even those that have successes from other methods. Nothing hinders a combination, and in some cancers the substitute is the only possibility. Occasional disappearances of cancer are reported from the use of hydrastis, of arsenic, of x-rays and ultra-violet light, of continuous cold, of the negative constant current, etc., etc. A great number of these disappearances are reported by Dr. Coley, who uses the toxins of two bacilli. An English physician has some successes resulting merely from measures calculated to perfect the general health. If cancer is the expression of weakened control on the part of the nervous system, the path to cure is likely to be but the path to general health—often difficult enough to find, however.

M. D.

## City Victims

AN official report by Dr. John Hill shows that Karma is already at work in the nearly sunless sky-scraper districts of cities. In New York, the field of his investigations, most Broadway offices require artificial light except for about five hours a day; along Exchange Place there is direct sunlight for about two hours only, in the forenoon. Eyesight is therefore being damaged, and the oculists testify to steady addition to their practices from the workers in these artificially lit districts. But the cañons must be answerable for much more serious degeneration than that of the eyes, some of it transmissible. M. D.

## Sargasso

THE origin of the Sargasso weed (*Sargassum bacciferum*) is still one of the *quaestiones perpetuae* of science. The old stories of ships being impeded in their passage by the immense fields of this floating seaweed may or may not be true—the writer has sailed through thousands of miles of it in all parts of the Atlantic but cannot recall any masses sufficient even to clog a steamer's screw—but this curious floating growth found in places as far apart as the Cape Verdes and Bermuda, Brazil and Australia, and even in Europe, has always presented the scientific puzzle, "Where did it originate?"

Statements having been made that it has been found growing attached, M. Sauvageau, in the *Comptes Rendus* of the Paris Biological Society, declares that they are without foundation, and as stated by a European chronicle of contemporary science, in view of the absence of known propagating grounds, "Piccone throws out the bold suggestion that it indicates a former tract of land now submerged. In the Sargasso Sea he detects traces of the lost Atlantis."

Whether or not this may be a reasonable theory, it is certainly time that, as recorded from week to week in the CENTURY PATH, the "bold suggestions" of today's scientific world should more often be recognized as having a strong family resemblance to the general suggestions given out twenty and thirty years ago by H. P. Blavatsky in *The Secret Doctrine* and in the earlier *Isis Unveiled*, in the face of the ridicule and orthodox persecution of the six continents. It is possible that in many cases the daring thinkers who cautiously advance new theories today may not consciously be aware that they have been anticipated to any extent, just as some prominent divines may or may not realize that their theological ideas of the most advanced kind are disguised or undisguised Theosophy (minus the name and the acknowledgment), and that their own representative bodies are the very ones who were most venomous against the Teacher who brought the message of Theosophy to the West. That the pages of the CENTURY PATH are very productive soil in which to dig for advanced "theological" ideas, many representatives of the churches know. Is it equally well known that for bold scientific suggestions the writings of the once unorthodox H. P.

Blavatsky are equally productive, as indeed are the pages of this Review on due occasion? The bold suggestion is offered—let science and its representatives look again at these works, openly and freely. Perhaps it will be repaid for the trouble, in spite of the drawback that these writings are not from the point of view of the personal, commercially profitable, materialistic, or any kind of "doxy" whatever.

P. M.

## Conservation of Nature in Italy

IN connexion with the subject of the conservation of natural resources, it is extremely interesting to learn that a somewhat similar movement is on foot in Italy, in which the King is taking an active part. An International Institute of Agriculture was founded in Rome in 1905 at a Conference representing forty nations, and the time has come when practical activities are to be commenced, as the Italian government has erected a palace for its headquarters in the beautiful Borghese Gardens, Rome. The idea was first suggested to the Italian authorities by an American, and King Victor Emanuel, who is a very broad-minded ruler, took it up at once, with the splendid result that twenty-five different governments specially interested in agriculture in all branches have united to send representatives who will constitute a veritable parliament of nations in a small way, with a permanent Cabinet and Ministers in the shape of Committees and officers. Regular financial

support will be given by all the countries represented; the United States' share for last year amounted to \$13,400.

The object of the Institute is to obtain "statistical, technical and economic information of interest to agriculturists," and to collect data, classify, investigate, and disseminate such information. Taken in connexion with the great effort of President Roosevelt at home, this magnificent uniting of forces for *International* aid and benefit in peaceful and productive occupations is no small thing, and no small proof that the spirit of brotherhood is working in the world in most unexpected ways, notwithstanding the dark shadows of the age. R.

## Lemurian Fauna for the Zoo

AN emissary of the Zoological Society has returned to London from Australia with specimens of Australian fauna for the Zoological Gardens. There are nearly 700: 100 mammals, and the rest birds and reptiles. Among the former are rare kangaroos, specimens of the dasyures or marsupial wild cats, Tasmanian devils, phalangiers (flying foxes, etc.) and porcupine anteaters. No specimen of the platypus or water-mole, which is said to lay eggs, could be obtained. Among the birds were the wingless kiwi, a giant kingfisher, brush turkeys, bustards, emus, cassowary and the black swan. Thus will the passing fauna of ancient Lemuria be preserved at least a while longer from extinction. T.

### Theosophy and Some of Life's Problems

WHEN a thoughtful person reaches that point in development at which the problems arising from the real needs of humanity and the terrible perplexities of the larger life outside the immediate personal surroundings, force themselves upon the mind for solution, the heart aches at the immensity of the prospect and the difficulties in the way of amelioration.

Humanitarians have tried to lift the burden of suffering in many ways; intellectual reasoners have attempted to develop the higher faculties by promoting facilities for advanced intellectual education; followers of the various creeds have tried by exhortation and prayer and the threat of future punishment or the promise of future reward to raise the standard of living; and many genuine lovers of humanity have thought that the alleviation of physical conditions, such as disease, excessive toil, or horrible surroundings was the most effective remedy. Though great efforts have been made, and rivers of gold poured out in charity (and the Theosophical student is not behind in honoring the brave and unselfish heroes who have spent their lives and even suffered many martyrdoms in following the highest ideal they could find), yet the citadel of darkness is not taken, the strong giant of selfishness is still firmly entrenched. Is not this because the remedies have been mainly directed towards the visible effects, and have been tried without real knowledge of the principal conditions of the problem, that is to say, without knowing man's real nature, object of life, or destiny?

Mankind is like a plant growing in a cave, which has not been able to fulfil the law of its being, for it is stunted, deformed and diseased for want of light. The vital question is how to bring it into the sunshine which will kill the germs of disease and provide it with the conditions it needs in order to grow into a stately tree fragrant with blossom and bearing wholesome fruits. There is little use in pruning or cultivating it so long as it is left in the twilight.

We have now to consider what are those problems upon which light must be thrown, and which are as pressing in the twentieth century A. D., as they may have been in the twentieth century B. C. — perhaps more so!

Firstly there is the old, old question: "If a man die shall he live again?" Science has no answer, in fact it avoids the subject as if it disliked it. Theology says: "Have faith and believe in the authority of the church"; but there is no proof that the ecclesiastics have certain knowledge themselves. Why is it that the two camps into which modern thought is divided are groping in ignorance upon this vital point? and why is it that Theosophy dares

to come forward and say that it alone can give a satisfactory answer in the affirmative? Surely it is because Theosophy is older than either; because Theosophy has never lost the ancient teachings about the true nature of man; because Theosophy can bring forward intelligent and rational explanations of the difficulties which meet the scientist in his explorations into mental and emotional conditions, as well as of the mysterious allusions and hints contained in the Bible and other World-Scriptures.

The problem, in other words, is whether man is an immortal Ego or Spirit, a spark of the Divine Life, eternal in the past and future, and moving on to a wondrous goal, taking up and wearing down body after body in its pilgrimage towards a fuller enlightenment, or whether humanity is no more than a higher group of perishable animal forms which have managed to outstrip the rest by superior cunning.

Theosophy speaks with the perfect confidence of knowledge on this subject. It brings forward a logical system of thought, the result of ages of experience, and backed by strong evidence; it says man's animal nature is not the whole, nor even the principal part of him, but that he is a soul for whom, in the words of Madame Blavatsky, "the hour shall never strike." The brain-mind and the lower material nature are the instruments through which the real self gains experience in this world — the final victory over the passions and reactionary tendencies bringing the union of the mind and the Higher Self, that is to say, immortality. Jesus had attained this, for he said he and his Father were One.

The extreme importance of the problem whether we are spiritual beings who have, for the time we are incarnated on earth, forgotten our origin and heavenly home "not made with hands," or whether we are mere temporary shadows, must be plain to all, for it brings up the practical question of Divine Justice and Law.

Law *versus* Chance is the next problem that confronts us, and without the key brought by Theosophy it is unanswerable. Why should one person be born under circumstances which provide every advantage, health, affection, and wise training, while another has to suffer from every possible disadvantage from the so-called accident of birth? Why should one be born into a family whose record is so discreditable that a hopeless hereditary taint is inevitable, while another takes up an incarnation prepared for by generations of pure living and high thinking?

Without the Theosophical key the problem is insoluble; but once the logical necessity of the pre-existence of the soul and its successive Reincarnations in order to gain experience and to wipe off debts where they were incurred, is seen, law and order take the place of chaos and hopeless confusion.

Without the glorious picture of Divine Justice and Mercy that the doctrine of Reincarnation shows us, life would be a bewilderment indeed, and the idea of the Divine government of the world a mockery. It is the reign of Law against the reign of Chance, and Theosophy is on the side of Law. Physical science attaches the greatest importance to the theory that every action in the material world must

work out its effects until its force is spent, and Theosophy carries this into the moral and intellectual worlds. The Bible says that not a sparrow falls to the ground unnoticed by the Divine Providence, and if this is so, how much more far-reaching must be the thoughts and acts that build up character. Surely St. Paul was right in saying: "Whatsoever a man soweth that shall he also reap."

We hear a good deal about the benefits of Freedom nowadays, but are we free as individuals in any real sense, so long as the animal side reigns almost unchecked? Are we free until our personal will has exerted itself to range ourselves on the side of the Higher Law, so to fulfil our highest possibilities? The only way to the real freedom is by obedience to the control of the Higher Self within, whose voice is first heard in the conscience. Theosophy has given a clear answer to all such problems, by once more, and without sensationalism or faddism, showing forth the way to understand the wise old saying "Out of the heart are the issues of life." Theosophy denies that attempts at inward reform can be successful all in a minute. Sudden conversions are apt to be delusive and to produce unforeseen consequences. The real change of heart and the permanent building up of the new life of freedom under the law is slowly formed. How aptly the soul has been compared to a butterfly, for, when the caterpillar shuts itself up in the apparently motionless cocoon, the transmutation of the ugly grub into the brilliant butterfly is a slow and silent performance, but one requiring tremendous internal effort. When the great work is really complete the result is apparent to all, and the freed creature flies out rejoicing in the sunshine.

Theosophy does not offer a sensational conversion as the means of progress, a hysterical and instantaneous transformation scene in the drama of life illuminated by spiritual fireworks and attended by admiring crowds, and so it is no wonder that the more superficial minds turn from it saying "Conduct! Obedience to the voice of conscience! Brotherhood! Is that the royal road? We have heard that before." But the serious and earnest will recognize the wisdom of working according to Nature's methods, for she does not build during the fury of the hurricane, but in the peace that follows.

Theosophy repeats the teaching of Jesus that the kingdom of heaven is within, and that the only way, therefore, to be saved is to get free from the lower selfish desires which shut us off from true sympathy and understanding of the needs of our fellows, and to unite with the Higher Self within which stands ever ready to respond to the slightest effort, for it is the Angel or Messenger of the Divine.

STUDENT

THE Secret Doctrine is the accumulated Wisdom of the Ages, and its cosmogony alone is the most stupendous and elaborate system: . . . It is useless to say that the system in question is no fancy of one or several isolated individuals. That it is the uninterrupted record covering thousands of generations of Seers whose respective experiences were made to test and to verify the traditions passed orally by one early race to another, of the teachings of higher and exalted beings, who watched over the childhood of Humanity.—H. P. Blavatsky

# NIGHT

Archibald Lampman

COME with thine unveiled worlds, O truth of night,  
Come with thy calm. Adown the shallow day  
Whose splendours hid the vaster world away,  
I wandered on this little plot of light,  
A dreamer among dreamers. Veiled or bright,  
Whether the gold shower roofed me or the gray,  
I strove and fretted at life's feverish play,  
And dreamed until the dream seemed infinite.

But now the gateway of the All unbars;  
The passions and the cares that beat so shrill,  
The giants of this petty world, disband;  
On the great threshold of the night I stand,  
Once more a soul self-cognizant and still,  
Among the wheeling multitude of stars.—*Selected*

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** If the doctrine of Karma is true, how are we rightly to condemn wrongdoing and oppression? Seeing, for instance, that the empires of Mexico and Peru were destroyed, have we to acknowledge that it was nothing but right that they were so destroyed, it being their Karma; and to look upon their destroyers as not to be blamed, as they were simply Karmic agents?

**Answer** Here we have the whole subject of a gloss that is sometimes put on the teaching of Karma, which stultifies the doctrine entirely. We take narrow views too often, having had no time to recover from early training. Think what it is that Theosophy shows a man to be; and take Reincarnation with its sister-teaching. Consider the offences of your life, this present one; small offences though they all of them may have been, in the aggregate they amount surely to something not insignificant. Innumerable lives are in your past, some of them better, and some doubtless worse. Suppose all the evil done in all of them came upon you at once: you would be crushed, the soul would be driven out of you; nothing would remain but a vacant lunatic. This is not Karma's way, since it is not the design of the universe to destroy humanity, but rather to lead it forward by the retribution in its sins. We (*scribes and Pharisees, hypocrites!*) — it is we only who feel "righteous" indignation when another does wrong, and the urge to set the matter right by seeing to it that the sinner shall suffer. It is true, if we only knew it, that Karma would attend to all that; would see to it in the best possible manner, and with absolute economy. No doubt when we so sin by interfering, we are the agents of Karma; but Karma loathes and is always avenged on its own wilful agents.

When Pizarro and his gang went to Peru no doubt the Inca race had accumulated enough wrongdoing to bring down all the suffering that was to come to them; but if that suffering had been spread out between then and now the race would not have fallen. Peru, we may surmise, had stored up as much for the race, of wisdom, experience, art, depth of outlook and so on as we are beginning to recognize that China has, or Japan. Heaven knows what might have been there! Something we should have learned as to social life and conditions, perhaps; something as to engineering; something as to good government. One is inclined to think that this something must have been very much, since it is not

to the mediocre that tragedy comes, but only to men of some spiritual standing; if good, they are a target for the forces that destroy our human upbuilding; if bad, nature arises in her time, and will have no more of them. All ancient history might long since have been made clear to us, and the origin of those races that emerge in splendor out of the forgotten. We have Asian tradition, and African and European tradition — who shall say that if we had American tradition and records in the same degree, a plan would not be evident, and a unity beneath all divergences? We should surely have known something of lands below the Atlantic, and of titanic emigrations at the dawn of time. The old lie of the little age of man, his supposed paltry six millenniums, might well have been hustled off the face of the earth long before this; and the weight of a thousand and one dogmas would have been rudely shaken, in all probability. All this supposing Mexico and Peru had lived on and grown naturally until now, not unaffected by Europe and not ruined by her. To have had such old and organized nations at her door, might even have saved young America from centuries of wandering after experience, from a thousand errors and given her the benefit of an outlook on life sanified and made mellow with age, one based on the verities, and enduring. It might have been all within the possibilities and intentions of Karma that these things should have been. The past is so vast behind us, that tomorrow and all this life may be filled full out of it with either blessings or curses; our own needs as a rule deciding which we shall have.

But there may come by us (Karma too — his Karma and ours) the man who has given himself the mission to be the punisher of others and instrument of the Law. It is he who sets his fellows in their place, choosing in his wisdom what and how they shall suffer. We are all mightier than the law in this sense: that the law cannot compel us to any action, or to any refraining. Our wills are free, and we may be as defiant as we please; Karma is for convincing us of the wisdom of doing right, not for forcing it. Only if we persist in our opposition, after a certain point it will destroy. So the distributor of sorrows is free to elect that we shall have discomfort from him, that we shall be improved; and we do get it, and deserve it; although the best design of the law was, maybe, that it should come to us dribbling through many years, or not at that time, or not in that way. So in a way there is much unjust suffering in the world, for which, as H. P. Blavatsky says, recompense is also provided in the scheme of things.

And of course it is not only the fool-pharisee we have spoken of that administers uncalled-for Karma, but all those who put themselves on the side of darkness by cultivating hatred or envy or inordinate greed. What shall we say when a virile nation is destroyed, one by no means sunk beyond hope into vice and devilry? It is true that with the Aztecs there was much that was villainous; but are we to suppose that there was no possibility of their being able to recall themselves to that better state from which they had fallen not so very long before the conquest? And we know nothing but good of the Peruvians.

Then too, if we consider how Islâm came to fall from being the bearer of light and culture

and learning, to its present position, we are forced to the conclusion that there is some power or influence deliberately interested in hindering the general progress, and cutting off, wherever possible, any growth that seems to bear in itself the promise of good things for humanity. The force of an awakening warrior spirit in Europe, which might have gone to sweeping away all kinds of wrongs in Europe, was seized upon and directed against the nearest civilization in Asia, a civilization rich with chivalry, rich in the spirit of discovery, and marked by the broadest religious toleration; and in crusade after crusade was used to shake and batter the Saracenic Empire until exhaustion fell on it; from which exhaustion western Asia and Mohammedanism have never recovered. To cover it up with "Karma" and exonerate the force that brought about these downfalls would be to miss the most important lessons of history. We cannot rest content with the attitude that "God's in his heaven, all's well with the world." All is not well, and will not be until we human beings have learned to be so perfect in duty that there will be no loopholes left through which the enemies of the race can enter. M.

**THEOSOPHIST.** . . . One general test may, however, be given: Will the proposed action tend to promote that true brotherhood which it is the aim of Theosophy to bring about? No real Theosophist will have much difficulty in applying such a test; once he is satisfied of this, his duty will lie in the direction of forming public opinion. And this can be attained only by inculcating those higher and nobler conceptions of public and private duties which lie at the root of all spiritual and material improvement. In every conceivable case he himself must be a center of spiritual action, and from him and his own daily individual life must radiate those higher spiritual forces which alone can regenerate his fellow-men.

**INQUIRER.** But why should he do this? Are not he and all, as you teach, conditioned by their Karma, and must not Karma necessarily work itself out on certain lines?

**THEO.** It is this very law of Karma which gives strength to all that I have said. The individual cannot separate himself from the race, nor the race from the individual. The law of Karma applies equally to all, though all are not equally developed. In helping on the development of others the Theosophist believes that he is not only helping them to fulfil their Karma, but that he is also, in the strictest sense, fulfilling his own. It is the development of humanity, of which both he and they are integral parts, that he has always in view, and he knows that any failure on his part to respond to the highest within him retards not only himself, but all, in their progressive march. By his actions he can make it either more difficult or more easy for humanity to attain the next higher plane of being.

**INQ.** How does this bear on the fourth of the principles you mentioned, viz., Reincarnation?

**THEO.** The connexion is most intimate. If our present lives depend upon the development of certain principles which are a growth from the germs left by a previous existence, the law holds good as regards the future.—*H. P. Blavatsky*

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Death a Rebirth

MOST readers can recollect accounts of people who have been saved at the last moment from drowning; who have fallen over a precipice and been resuscitated; or who have otherwise been brought back to life when *in articulo mortis*; and who have described their experiences as having been, after the first struggles were over, ineffably pleasurable. Another such account is that of a clergyman who was once hanged as a Confederate spy, but cut down (under the impression that he was the wrong man) after four minutes. The hanging seems to have been done in such a way as to kill by slow strangulation, not by dislocation of the spine. His first sensation was that of an oppressive fulness, as though a steam boiler were about to burst within him. This was accompanied by a painful tingling in every part of the body. Then there was a feeling of an explosion, followed by a sense of intense relief and great happiness, while a white transparent light broke on his eyes. A taste of sweetness, unlike anything ever known, came into his mouth, and he felt himself moving on with a consciousness of leaving everything behind. Then he heard the sweetest of music as of a thousand harps accompanied by myriads of voices.

The sensation of return to life was as painful as the first few moments of leaving it; an experience which also is common to stories of this kind.

Such testimonies as this — and they are sufficiently numerous to serve as evidence — ought to help to take away the absurd terror of death. There is no fear that they will encourage suicide, for the evidence they afford of *continued existence after death* is enough to deter anyone from entering into that state rashly and in violation of a natural law. But they can alleviate our horror of death when it comes naturally or unavoidably. With this may be taken the accounts which doctors give of death-beds.

They that have seen thy look in death  
No more may fear to die.

It is interesting to note how the inner astral body dissociated itself from the outer, painfully stretching its myriad links and soaring away from the limitations of that association; and how the dissociation from the flesh

## MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

meant happiness. Do we not experience the same in some degree in sleep?

Death should be looked upon as a natural process, not as a bugbear. Death is really a chimera invented by the gloomy imagination of man. That for which he has substituted death is really only change, transformation, rebirth. Was not this man in the story rather reborn than killed? Death, in the sense of transformation, takes place every moment in all nature including our own bodies; for old forms are continually yielding up their life to new ones. In sleep at night there is a great change of the same kind. After seventy years or so comes a still greater renewal, but still it is but a rest, a rejuvenation, a rebirth. It is only man who has invented the idea of death as final destruction.

As sings a wise man of old, in a part of his sayings which for some reason or other, has not been given a place in the Christian scriptures which contain other parts of them:

Seek not death in the error of your life; and pull not upon yourselves destruction with the works of your hands.

For God made not death: neither hath he pleasure in the destruction of the living.

For he created all things that they might have their being: and the generations of the world were healthful.

And there is no poison of destruction in them, nor the kingdom of death upon the earth.

But ungodly men with their works and words called it to them:

For when they thought to have it their friend, they consumed to nought, and made covenant with it, because they are worthy to take part with it.

*The Wisdom of Solomon, Apocrypha*

As so fully explained by H. P. Blavatsky in *The Key to Theosophy*, Theosophy teaches that there is no state worse than may be experienced on this earth; and death is a liberation and refreshment for the weary Soul, enabling it to take up new duties on its return. It is man's morbid fancy that has painted con-

ditions of after-life worse than those on earth, (and so indeed they are for *suicides*, who, in cowardice or selfish fear, exchange their state for a worse as though souls were not in need of rest and consolation rather than more suffering. But Nature is not so ruthless as we are fond of painting her. Nor does the weary soul, after its life of les-

sons learned and unlearned, victories yet to be won, strive to communicate with eminent scientists for the purpose of proving its identity by a display of familiarity with the trivial incidents of life. When the body dies, the dissociation of the different principles that constituted the man on earth results not only in a casting off of animal *exuviae*, but in a shedding of many astral and psychic remains, which, being no longer held together in a human unity, become — for a time — separate semi-conscious shells. These unconscious or semi-conscious elements are automatic in their action and can be attracted to circles of sitters, where they will repeat themselves mechanically. The professors are but turning over astral scrap-heaps in search of the abandoned buttons and torn-up papers of the deceased.

So much for one aspect of the question of death. Another aspect is the question of bereavement. Bereavement will always be a hard thing to bear so long as people are so chained to terrestrial consciousness and have so little sense of any other kind of existence. They were so conscious of their friend's *physical* existence, and so little aware either of his or their own *spiritual* existence, that death seems to them to destroy all. But what need is there to add to the sorrows of bereavement by preaching a doctrine that declares that one's loved mother is burning in hell, or that one's child is being tortured because it was not baptized? The consolation that Theosophy can give is unlimited, increasing indefinitely as our knowledge increases. One who has loved unselfishly must surely be glad to feel that the Soul is at rest, and that spiritually there is no separation. Bereavement, though a painful experience, may be turned into a blessing if it raises the bereaved to broader, nobler, conceptions of life.

MAN walks on, and Karma follows him along with his shadow.—*Gems from the East*

### A Delayed Message

IN the recently published *Life and Letters* of Herbert Spencer we have the last touches to the picture of him which since his death has been gradually getting completed in the public mind.

The picture is eminently suggestive of something which has, however, suggested itself to no one. It is the picture of a thinker who with his death closed a cycle of his thought which did not open with his birth. It is a picture which requires another or others to complete it, that other or others being of the same thinker in one or more preceding lives.

He was born with an undelivered message to give, a message not from the gods so much as from himself. And he could not die until he had given it. Says his secretary:

Mr. Spencer was seventy-six years of age when he dictated to me the last words of "Industrial Institutions," with the completion of which the "Synthetic Philosophy" was finished: to be precise, it was on August 13, 1896. Rising slowly from his seat in the study at 64 Avenue Road, his face beaming with joy, he extended his hand across the table, and we shook hands on the auspicious event. "I have finished the task I have lived for," was all he said, and then resumed his seat.

He was conscious of his message from the time he published his first book, *Social Statics*. Not so very long after that came the prospectus, a foreshadowing of the whole body of thought which he spent the next forty years in elaborating. His message stood complete in his mind; now he had to deliver it, and to that delivery he regarded himself as pledged or consecrated.

How does the phenomenon look in the light of the theory of Reincarnation? Let us assume for the moment its truth. Looking back to some other century, we can imagine a cloistered thinker spending his life upon the meaning of the maze of nature. For long years he sees no clue, no unity of trend. But the search for one has absorbed his whole consciousness. Not until his very death, perhaps, and then perhaps suddenly, did it seem to him that the formula from the homogeneous to the heterogeneous and thence back to the homogeneous was capable of application to the whole field of nature.

Now comes the present birth. Deep in his consciousness is the fruit of all that thinking, pressing slowly outward into forms of the new brain. He feels its presence as the urge to amass knowledge of every kind, to know all sciences. His knowledge begins at once to fall into place. The hereditary religious creed drops away little by little. He makes tentative excursions into print. And at last he begins to come by his own. The path cut by the hard thought of another life now needs but re-opening; the re-treading is matter of far less time and effort than the first slow clearance. And so in the very early years of middle life he is ready to speak; he is at the point which before took perhaps until death to reach. He can now fulfil his purpose.

Surely such a hypothesis throws a better light on so great a mental phenomenon than — we were going to say than any other. But is there any other? The mystic word heredity is here about as useful as Mesopotamia. We come from "elsewhere" trailing not only clouds of glory but clouds of other kind — of unfinished thought and deed. STUDENT

### What Guides the Muscles?

IT seems that insufficient attention is given to the mental or sub-mental problems involved in muscular action. It is at once evident that it is not what we call "thought," because that at once nullifies all muscular freedom of action, as is easily proved by a moment's trial. Yet when we do stop to think out action we find that considerable mathematics are required to solve its problems. Any healthy boy can run and jump over a stick, but only a first-class engineer can work out a statement of the action in mechanical terms of weight, stress and power. Any healthy person, dog or horse, or other such animal, can run and jump; it is done many thousands of times daily; yet none, even of the humans, solve its problems mentally. The distance is instinctively measured and divided into step-lengths so as to "take off" from the proper foot. How is all this done? What subconscious action of the mind is able to solve instantly problems which require many minutes to work out by conscious thought, and to estimate the factors of weight, velocity, power, etc., which the mind would need to measure?

By practice that same "instinct" can be carried outside our bodies so as to give at a glance the dimensions and details of a required bridge, the outline of a required building, etc., as easily and correctly as it measures the strength and steps in running and jumping. In muscular action we call it "instinct," to hide our ignorance; in the larger affairs of life we name it "common sense" and "tact." Some are so fanciful and heretical as to believe that it is a super-mental faculty which they style "intuition" or "Mind-perception" to distinguish it from mental action or "thought."

In any case the facts remain, explain them how we may. RALPH WYTHBOURNE

[There are other minds in the universe besides one's own; and thinking and calculating can go on without our conscious superintendence. The action of my mind is perfectly unconscious to you, yet it is none the worse for that. Similarly, most of my own bodily functions and a considerable part of my mental ones will go on without my knowledge and attention. We must not confuse intelligence with personal consciousness.

The human organism is like a huge staff of workmen, each with his appointed task. All have been taught their work at one time or another and now perform it without supervision. The master leaves them to themselves while he turns his attention elsewhere. Some of these workmen were trained long ages ago in the lower kingdoms of Nature, where we still see others being trained in like manner. For the bulk of our faculties come to us ready-made at birth. So when we jump or run, we do not have to calculate, but simply issue orders to the little brains that control these movements.

It is practically impossible to explain these things if limited to the ideas of modern science; for the "atomo-mechanical" theory of the universe is not adequate as a means of explanation. How are the experiences of long ages or development in the lower kingdoms brought over into the human fetus?

We need a science that regards the universe

as Mind, and atoms as Beings, ere we can understand the processes that go to the formation of a complete human being. A study of Theosophy from the beginning is necessary as a first step, and then light will come.

### Theosophy in the Prisons

NO thinking man can fail to see that a revelation of truth serves no good purpose, unless it becomes a part of the animating life of the student who realizes it. Nor can it be denied, that the world today is sorely in need of some such revelation — one indeed that shall answer the great questions which all are asking, and shall prove its worth by an unanswerable appeal both to the intellect and to the heart.

Intellectually Theosophy has been established and it has come to stay. But in its primary object as a great moral reform movement, although it has accomplished wonders in a few short years, yet that which has to be done is so vast and so sorely needed, that were it not for a boundless confidence in the power of Truth, one would stand appalled at the gigantic task that must be undertaken. Yet beginnings have been made with astonishing success.

Of these beginnings, one out of many, is the prison work carried on by Katherine Tingley with the help of her students. The value of this work is continually becoming more widely recognized. The prisons of California, as being near the Theosophical center at Point Loma, have received most attention — all that time and opportunity could give.

A paragraph which has been noticed by the Press, describes this work and shows its value. It appeared first in a paper published in India by a body which has disavowed its sympathy with the philanthropic side of the work of Katherine Tingley, as being in its opinion, "untheosophical"! This tardy recognition from that quarter is therefore not uninteresting:—

Of all the forms of religious and ethical consolation offered to the inmates of the prisons of California—from the ministry of the Roman Catholic priest to the exhortation of Salvation Army representatives—Theosophy alone appealed to any considerable number. It is the explanation afforded by Theosophy of the seeming cruelty of a blind Fate to the helpless and oppressed which appeals to the man who feels that he has unjustly suffered. A doctrine which explains that the seething injustice which he sees about him is not, after all, actual injustice, but is rather the harvest of past sowing, is one which is, generally speaking, eagerly accepted by the intelligent man behind bars—and, for the benefit of those who know little of prison life or conditions, it may be added that the percentage of intelligent, often well-educated, men in prisons today is large. Even more important and practical, as regards the present regulation of conduct, is the corollary, that as is the sowing today so will be the fruitage in the next life. That this, too, has been assimilated by those who have received the teachings of Theosophy, the subsequent official record of such prisoners testifies. The idea of reincarnation, when once grasped by a man in this position, is comfort unspeakable. To feel that he who has been "up against it" in this life will have another chance, that after all he will have a "fair show," means more than the average man or woman whose life has flowed along lines of ordinary ease and comfort can well imagine.

### Arithmetic Problems of Other Times

READERS of the CENTURY PATH will be familiar with the fact that the ancient Egyptians and Hindûs were no sluggards in mathematics. In *Isis Unveiled*, H. P. Blavatsky has pointed out the depth of their astronomical researches, which "must have extended over 10,000 years,"\* and there are in European libraries translations of an ancient Hindû astronomical work which gives, among data of enormous epochs of which some are not recognized today, the length of a year in sidereal days, correct to the *hundredth part of a second* of time. Every schoolboy knows that Euclid wrote his famous *Elements* in Greece about 300 B. C., and the precision of his logical reasoning was such that the book is practically unaltered to the present day. Nevertheless, few know how closely the mathematical problems of the Hindûs and Greeks resemble those which can be found now in our schoolrooms and colleges; they resemble ours, and yet they have a charm and quaintness of their own due to a thought-touch free from commercialism and pedagogy.

Stobaios relates a little story of Euclid as a teacher which will awaken instant sympathy in anyone who has taught geometry to the modern boy. A youth had begun to read geometry with Euclid, and when he had learned the first proposition, inquired: "What do I get by learning these things?" Euclid summoned his slave and said, "Give him two oboloi (six cents) since he must make gain out of what he learns." An answer that may give most of us a moment or two of straight thinking.

One of Euclid's problems is recorded as follows:

A mule and a donkey were walking along laden with corn. The mule said to the donkey: "If you gave me one measure, I should carry twice as much as you. If I gave you one, we should both carry equal burdens." Tell me their burdens, O most learned master of geometry.

Diophantos was almost the last mathematician of the Greek Alexandrian school, which was famous through its connexion with Theon of Smyrna, father of the great Hypatia. The place of nativity and parentage of Diophantos are unknown to us, and we only know his age from his epitaph, which is a typical example of the algebraical problems which were his special study. It runs thus:

Diophantos passed 1/6 of his life in childhood, 1/12 in youth, and 1/7 more as a bachelor; five years after his marriage was born a son who died four years before his father, at half his father's age.

Quite different are the problems of the Hindû mathematicians. Here is one from Āryabhata:

Beautiful maiden with beaming eyes, tell me, as thou understandest the right method of inversion, which is that number which multiplied by 3, then increased by 3/4 of the product, divided by 7, diminished by 1/3 of the quotient, multiplied by itself, diminished by 52, the square root extracted, addition of 8 and division by 10, gives the number 2?

In a work entitled *Siddhāntaśiromani* (Diamond of an Astronomical System) written by Bhāskarāchārya is a chapter entitled *Līlāvātī* (the beautiful, or noble), and one of its problems will suffice to illustrate its style:

The square root of half the number of bees in

a swarm has flown out upon a jessamine bush, 8/9 of the whole swarm has remained behind; one female bee flies about a male that is buzzing within a lotus flower into which he was allured in the night by its sweet odors, but is now imprisoned in it. Tell me the number of the bees.

It may be noted here that all Hindû school books were written in verse and these problems were also favorite social amusement. Both the form and the spirit of the arithmetic and algebra of modern times are essentially Indian, our notation having come to us from them through the Arabs. Many of the theorems in algebra and geometry "discovered" by Europeans were found to have been known to the Hindûs when translations of their mathematical works became available.

To come to later times. We now possess a few copies of a book entitled, *Problems for Quickening the Mind*. A good "Mind-quickener" is the following:

A ferryman has to cross a river in a boat which will only hold one besides himself. He must carry a wolf, a goat, and a cabbage. How must he do it so that the goat shall not eat the cabbage, nor the wolf the goat?

This work is thought to be some 1200 years old and is attributed to Alcuin, an Irish mathematician who was afterwards attached to the brilliant court of Charlemagne.

F. W.

### Just for Fun

IT would appear that when you call upon a vivisector, you may, if you stand in favor with him, be shown a little example just to amuse you. In the fifth report of the English Royal Commission, just published, we learn that an army officer, apparently the personal friend of a vivisector, called at the latter's laboratory and was favored with one of the little examples of the art. The Hon. Stephen Coleridge, summarizing the report says:

Mr. Gaskell, the Commissioner in question, having been accused of cruelty to his face by Col. Lawrie, a previous witness, who had visited his laboratory and witnessed some experiments, took his seat in the witness chair after Col. Lawrie had departed, and there, under the friendly interrogation of Lord Selby, announced that he did the particular experiment not to investigate any unknown question of physiology, not to pursue any avenue of research, but in order "to please Col. Lawrie."

From Col. Lawrie's own evidence the experiment does not seem to have pleased him very much, and Col. Lawrie has told us what he thought about it in very plain language. At Q. 21,087, speaking of the dogs, he says, "They appeared to be in frightful agony."

It appears from the evidence of all concerned that the two dogs that were being vivisected were left on the operating table while Mr. Gaskell and his friends went off to luncheon, and I should imagine that even to the most ardent supporter of "research" the spectacle of the vivisected dogs lying in one room on their operating board while the vivisectors and their friends are partaking of luncheon in another, is not one of which he can be proud. I invite the public to its contemplation as a sample of what Lord Cromer's Society desires to defend and perpetuate in this country.

M. Coleridge points out that there is, curiously enough, no provision in the permissive Act of 1876 enabling vivisectors to perform experiments for the gratification of their friends. The experiments must be directed to the prolongation of life, the alleviation of suf-

fering, the advancement of knowledge, or the corroboration of doubtful previous experiments.

The lesson of the incident for the public is the callousing of the moral nature of the experimenters which their work entails. It is also worth remembering that vivisectors are often physicians to whose care our wives and families are entrusted.

STUDENT

### A Pacific Coast Volcano

MOUNT HOOD in Oregon seems inclined to give trouble. In fact the question is becoming interesting—is he giving a few final kicklets before expiring finally, or is he stirring for a new cycle of activity? Time was, of course, back in Lemurian days, when he must have made things pretty lively over a very long radius. But then the whole range, from Cape Horn to Alaska, one of the earth's two spinal columns which run at right angles to each other, was full of youthful energy.

Twenty-four years ago Mount Hood did a little smoking; but after that, and until about 1904, all seems to have been quiet again. Since the latter date there has been considerably more smoking as well as other very definite phenomena. The temperature is rising and one observer reported a glow one night behind Crater Rock which he compared to a furnace. Mr. Sylvester, surveying for the U. S. Government reports:

I returned the next day (August 29 of last year), crossing on the way the White River, which had swollen over night to an angry stream of treble its volume of the day before. The weather was cold, and though a drizzling rain had begun to fall in the early morning, *there was no warrant for the rise in the stream except the volcanic heat melting the glacier which is its source.* (Italics his.)

The glaciation about the sides of the giant tells an interesting story. He must have slept for ages to allow of the accumulation of snow and ice which, in slowly slipping and melting, constituted the first glacier. Recent streams have cut deep cañons in whose sides the layers of time can be seen. In one place the ice of this immensely ancient glacier still remains, the deepest layer of all and itself from ten to fifteen feet thick. Over this lies a layer from 75 to 150 feet thick of super-glacial drift. On this some soil finally collected to a depth of 3 or 4 feet, allowing of the growth of a forest the roots and ruins of which still remain. After that there was another glacial period, destroying the forest and itself accumulating drift to a depth of from 10 to 75 feet. And now a forest is beginning to grow on that. Will it live to be destroyed by a glacial period far in the future, or burned up by an approaching lava flow?

### Old-Fashioned Windmills Best

IT is stated that experiments by the Danish Government with windmills for electric power generation have resulted in proving that the old four-armed type is the best, giving most power for a given area. Yet how many people have regarded these ancient windmills as the crude attempts of people who could do no better, and the modern many-armed type as an improvement on scientific lines? Is not this, and other cases like it, a warning against the too hasty assumption that what is old-fashioned is inferior or unworthy of attention? T.

## THE INDIAN WEAVER

EDWIN L. SABIN IN MARCH *Craftsman*

**Y**ONDER amidst the blist'ring sands,  
The Indian's rude-built hogan stands,  
Under the blue and flawless sky  
'Neath which fair crest and canyon lie.  
Patterned with mystic, strange design—  
With square and fret-work and bar and line—  
Here on the loom behold it grow:  
The blanket of the Navajo.

Ploddingly woven, thread by thread,  
In white and black, in the gray and red,  
Emblems bearing of life and death,  
The lightning's path, the storm-cloud's breath,  
Slope of mountain and drench of rain,  
The four winds, issue of peak and plain,  
Village, and journey long and steep,  
The blanket fills while graze the sheep.

Patient the swarthy toiler weaves;  
For friend or alien alike achieves;  
Pictures a country loved right well;  
Thereof old legends; and may not tell  
Whether a pale-face eye afar  
Will only a rug regard, bizarre,  
Or see, interpreting the lore,  
The Painted Desert on his floor.

### The Art of Our Arizona Indians

**I**N an article recently written for one of our leading magazines by Frederick Monsen, the artist who has done so much to bring to the general public some facts about the Hopi tribes of our Arizona Indians, and who has a deep sympathy for them because of the way in which they have been misunderstood, this artist states that unless some change occurs, all that is best in native Indian art is doomed, and utterly so. To quote a brief paragraph or two from the article:

To go directly to the root of the matter, the thrusting of the Christian religion upon these Indians, in the way it is done, is a mistake that could hardly be made even by a missionary society if the members who so zealously work to raise money for the salvation of the heathen had even a glimmer of understanding of the old belief they are trying to displace, and of the inevitable effect of its destruction. Taught in the Nature religion of his forefathers, the Indian knows no hypocrisy. His life is an open book and from his ceremonial birth to his ceremonial death he is open, honest, and truthful. He is a hard worker, anxious to make a living and anxious to make both ends meet, and for this very reason he has developed many traits of character which the civilized man of modern times would do well to seek for himself. Of course, there are Indians and Indians, but I speak of the Indians of the desert where the means of life are not easily obtained. They show in a marked degree the strength of moral fiber and the purity of life that come from a hard struggle with an austere environment. Religion is inborn in every natural man and the Indian, being wholly a natural man, has that sense of oneness with Nature and that worship of the Spirit lying behind the great natural forces, which is as far superior to the dogmatism ordinarily called Christianity as the music of the spheres is to the jangling of warring creeds. Every act of the daily life of these primitive Desert people has some religious significance. They are as simple and sincere in their faith as little children, and everything in life to them is founded upon that faith. It is handed down from father to son by word of

NAVAJO WEAVER AT LOOM

mouth and is kept unchanged from generation to generation. When a child reaches the age of six or seven he is taken to a *kiva*, or underground ceremonial chamber where are gathered the elders of the pueblo, and there he is taught, word by word and sentence by sentence, to repeat in metrical form the belief and religious history of his people. This is impressed so deeply upon his childish brain that thereafter it colors and controls all of his life. His work, his play, his festivals, his ceremonials, all have to him a deep and sacred significance, *all his art is founded upon his religion* and everything fashioned and ornamented by his hand is an expression of some phase of his religious belief. Take away his religion and you take away his art, his morals, his motive for industry, in fact, everything that goes to make up his life. And what have we to give him in place of these? A creed that he cannot understand and that seems to him foolish and opposed to the Nature he knows so well, therefore a creed that he cannot profess or follow without hypocrisy,

and so concealment and dishonesty are born; a small smattering of the white man's stereotyped book-learning in the place of his own deeply significant and symbolic Nature lore, and so all his standards are upset and his mind set adrift in unknown seas of incomprehensible thought; a half knowledge of some of the white man's minor trades and industries, with the assurance that only by these can he earn a living, and so his own ancient and wonderful industries are destroyed, and not only does he lose his only sure means of securing a livelihood, but the country loses a true and natural expression of art that our modern civilization can ill afford to spare. . . . If the conscientious people, who, with more zeal than knowledge of art or any true craftsmanship, now try to teach the Indian some of the lesser industries of the white man, would only qualify themselves to give practical instruction as to the best methods of reviving partially lost arts such as the old use of vegetable dyes and the ancient method of glazing pottery, and so give him better facilities for working at his own primitive, beautiful crafts, there would be no difficulty as to the ability of the Indian to earn his living, or about finding a ready market for his fabrics, baskets and pottery made and decorated after the ancient manner of his race. Instead, the world is losing something of pure beauty because it knows no better than to thrust aside these things and to force the Indian to make hideous commercial trash that has no value to himself or to anyone else. . . . Some day, when it is too late, we may realize what we have lost by forcing the Indian to accept our more complex but far inferior standards of life, work, and art. These sound like strong statements, but let any man who doubts their truth take a journey through the Painted Desert and live for awhile with these gentle brown children of an ancient race. The chances are that he would find himself the learner instead of the teacher and, if he has ears to hear and eyes to see, the spell of the Desert would be upon him all his days.

The question of how to revive and preserve the better uses of the now decaying Indian arts has been discussed in this and other journals for many years. In the course of the last decade several individual investigators have come forward with impassioned appeals to the general public to do something to save our beautiful native art-crafts. But so far practically nothing has been accomplished beyond the somewhat increased demand for Indian art-craft products that would naturally arise from a widening public interest in them. And the profits of this, sad to relate, mostly go into the pockets of the shrewd and conscienceless buyers. The Indian, for all our talking, is little better off than he was before, and his craftsmanship is steadily deteriorating for, as alluded to in the excerpt quoted, he is not encouraged to produce his best.

Since the beginning of her work as Leader of the Theosophical Movement Katherine Tingley has accentuated a deep heart-interest in our native Indian peoples and their marvelous arts and crafts. In the Raja Yoga Schools, for instance in Cuba, is growing up a generation of children who not only are filled with a strong desire to be of service to all who are in need, but who, from being themselves trained in the making of pottery and all the intricacies of Indian basketry-art, will be fitted to extend to the Indian effective help. H. H.

If all homes were what they should be there would be  
no need for Raja Yoga Schools.—Katherine Tingley

### The Homes of Merrie England

IT must be obvious to any thinker that each country has a certain weight or place in the world of nations, and if endeavors be made to trace this, that the source will be found in the home life: on what it contributes will depend a nation's progress and power. The study of a subject of such importance will repay the efforts of the best minds.

Home is that province in which preparations are made for the work of a life-time and where, when that work is accomplished, the doer returns as does a homing pigeon to the nest. It has been defined as a place where "hearts are sure of each other," therefore, where nothing evil should enter and where soiled shoes must be left outside—this last, just what is done in most Eastern countries, literally. If this were so, the owners of our homes would be the leaders of and examples to the people. If they have rightly regarded their responsibilities in the past, old associations will have been formed, bonds of understanding and sympathy established between all classes. At all costs let them preserve and carefully guard the old homesteads, not in the spirit of the dog in the manger, but in trust for the enrichment of the national life. People are quick to recognize and to trust as guides men of high character, nor will they grudge to them—when earned by service—the necessary privacy, influence and associations of their ancestral homes.

Consider, for instance, the homes of England, the home-country of so many colonies, the mother-colony of fair daughters who themselves possess the powers, if steadily and rightly developed, to build up as great an influence, to gain as vast an experience, as "the old country" rightly claims; such greatness owing largely to the fact that British homes are many and various.

There are "the stately homes of England"; also, alas! there are the slums, and still worse, their fringe of helpless homeless humanity

that sleeps in casual wards, work-houses and prisons. Between these are homes of all descriptions and rank; clean or dirty they are, cultured, refined, smart, vulgar, or criminal; the squatter's cabin, the laborer's cottage and the skilled workman's dwelling; farms of yeomen, of tenants, villas of professional men, of dilettanti; estates of the gentry, large or small, busy or idle; the mansions and dower-houses of county landowners and of statesmen. Many are true homes, centers of love

### THE GIFT OF THE DAWN

SARAH D. HOBART IN *Harper's Bazaar*

WHAT was the song of the night?  
Baffled by unseen powers,  
Heard I its desolate wail  
Through all the sorrowful hours.  
Over the compassing hills,  
Gloom-haunted valleys across,  
Quivered its burden of grief,  
Of loss, loss, loss!

Now, through the glory of morn  
Pulses a magical strain.  
Courage and blessing and faith  
Blend in the tender refrain.  
Purer than dreams of the past,  
Dearer than lover or friend,  
The spirit that dares and achieves  
Cries, "Do, and endure to the end!"

and devotion, and fine examples of unselfish work.

The home of the slum—what may it be? One small room in a house of many overlooking a court that the sun never warms, approached by an alley off a poor street, down which even the police dare not go. Here a woman will think nothing of spending a night on the doorstep with her children, because the head of the house has returned the worse for liquor, and it were safer to be out of the reach of his temper and heavy hand. Yet it is home to them.

The home of the yeoman stands on his own

land; it has been in the family three or four hundred years, perhaps longer. The floor of the large living-room is stone, sanded; it has a great ingle-nook fireplace and high-backed settles placed at right angles, tables and chests of home-grown oak brightly polished by "elbow grease"; sides of home-cured bacon may be hanging from the ceiling, a smell of buttermilk is probably noticeable, while a cat and collie dog are certain to be members of the family.

Another ancient home is externally black and white; it is surrounded by many acres of land, has a dower-house, perhaps, and two or three lodges. Flowering shrubs and copper beeches contrast well with the green lawn, and an old rose garden may be hidden away in some sheltered corner open to the east. The house is built around a quadrangle with an entrance-arch for carriages. A great dining hall forms one side, with paneled walls, ceiling and gallery of dark oak, relieved by numerous portraits of ancestors that add strangely to the ghostly feeling of these old oak houses—for there is almost sure to be a haunted room in them, somewhere.

A typical "stately home" or county magnate's castle may include the above features on a larger scale, be the center of a district of rented properties or farms, a village, or even a small country or manufacturing town. The walled park may be partially bounded by a river where the salmon leap, silvery bright in the sunshine, a river which is reached by heather paths or through woods of pines, chestnuts, beeches, tangled masses of hawthorn, honeysuckle and wild roses. Here streamlets abounding in fish hurry down to the river, and rabbits, squirrels, pheasants and numerous smaller birds are all about. Beyond, the meadow stretches away to the hills, dotted by red-tiled cottages, homes, farm-buildings, stables, etc. Nearer to the castle is the park proper, with well grown oaks, elms, beeches, limes, these the chief wealth of such an estate. Under them the cattle and colts graze, and lambs,

in the springtime, discuss their games or run races from one to another at sunset. Nearer still are the different gardens—rose, alpine, winter; the conservatories, the forcing-houses for flowers and fruit, leading to the terraces, where the old clipped yews stand guard as sentinels and from which the green lawns can be seen stretching away under the trees until lost in the distance. The green lawns of England are unrivaled and represent centuries of patient labor. The building may be of red brick, faced with white stone or red or yellow sandstone; it will contain a chapel, art galleries, suites of guest rooms and a great central hall, with fire-grate to burn logs, an organ, etc. Family portraits look down from the walls and tell their silent stories in the twilight, under cover of music and chatter.

Here, once in the day, if the custom be kept up, the whole family meets together for morning prayer. Strictly according to rank the whole household files in; some will be old retainers and so are part of the family, their lives spent in the one service as were those of their parents before them. They speak of "the old master" and "the young master" and do their utmost to hand on the rules and traditions of the house to younger servants and teach them their proper places. The children's quarters form usually a separate wing, rightly or wrongly, depending on what goes on in *all* the wings. Such a house is a school, a miniature world. Organization and wise government are essential; also responsible heads of departments who are of high character and have knowledge of human nature. They are accountable to the mistress or her substitute, all thus being under the one head, and behind that is the usually unseen power of the true head of the house—or "master." Here indeed may women find that field for usefulness which they crave; here is a demand for all branches of learning she has made her own; here she may wield real power and influence in proportion as she recognizes the divinity of her nature and realizes the practical power of selflessness.

Let the dwellers in such centers grasp the fact that only those *can* lead whose homes and characters are built on the old-time solid virtues of chastity, backed by sacrifice, truth, power, beauty, life, memory, and obedience, those seven stones that John Ruskin declared to be essential to any edifice. Then protection is required. Where is now the night-watchman whose duty it was to guard the house and call out the hour? A similar watch on the part of responsible heads would ensure the soiled shoes being left outside. There have been such guarded homes, consequently real influ-

ences and examples to the county; such as that of the late Duke of Westminster, so influential in Cheshire. His income was said to be £1000 a day, yet he worked as hard and for longer hours than any laborer on the Eaton Estates. Another example may be found in Chatsworth, Derbyshire. Lord Rosebery secured the success of the London County Council by his personal efforts; while many labor as Mayors for the honest government of towns.

Quiet, cultured, unadvertised, almost hidden, as the heart of the rose is England's emblem. And why should not our home makers shelter and guard far greater souls, who can lead the peoples on to another Golden Age, and show the true meaning of life and its duty? Let it be remembered that life means progress, not stagnation; that real evolution is a propelling force and that Theosophy—

not explain its methods. But, unfortunately, genius often lacks the balance-wheel of common-sense. It falls by the wayside, consumed by its own fire. Talent is more sane and, I may add, achieves where genius fails.

The girl with talent, or even genius, has nothing to do with greatness or success until her studies are completed. But day by day she may and, indeed, *must* excel in her task; that is to say, she must do it better than the average—her standard must be head and shoulders above the normal.

A regular routine of so many hours a day—a reasonable number—in the morning, especially when one's vitality is unimpaired, is infinitely preferable and accomplishes better results than the spasmodic, exaggerated attempt to cram as much work into a day as possible. The girl who thinks, talks and acts the music drudge for sixteen hours out of the twenty-four will acquire neither technique nor musical development. It is the quality not the quantity of work that really counts.

But under no circumstances should I advise a girl to enter the life of a student in a strange city without the care and guidance of a mother or a guardian. I had the inestimable treasure of a mother's care during my student life and during the first ten years of my concert work. A girl should be free from the consciousness of dangers and temptations; she should meet strangers without an undercurrent of suspicion and watchfulness. Young girls are none too wise; they require a person in authority to regulate their meals, their hours of rising and retiring. A certain amount of musical talent, or even that rare thing, genius, does not presuppose an old head on young shoulders.

*Long before a girl of the right caliber has completed her studies, she should have received the baptism of her vocation—the words "fame" and "greatness" should have disappeared, to be replaced by truth and art.*

She must be a worshiper of the thing itself. Her ambition should no longer be to excel but to deliver the message of the musician. Her own greatness should count for nothing beside the greatness of her art. When she is emancipated from her teachers she must not fear to seek and develop the creative spirit within herself. While she should not shun the world or her fellow beings, she should commune within herself and seek to fathom the depths and heights of her own individuality. I lay great stress on these seasons of solitude. I cannot tell how precious I hold those long hours quite to myself on a swiftly moving train. I sit alone sometimes for days, unknown and knowing no one. Never does the voice of my art speak so clearly and truly as in those long and silent days of journeying across a vast desert or cutting a path through the mountains. It never occurs to me to ask myself if I have achieved greatness or fame, but I do realize with a thrill of wonder and delight that after long, long years of praying and fasting in the temple, I am able to deliver the message of my art to hungry and thirsty souls.

What contrast between these ideals and the sordid, selfish ones not infrequently cherished by some the world calls musicians. STUDENT

#### The Message of One's Art

THE following, from an article written for a current magazine by Maud Powell, the greatest woman violinist of the present day and the undoubted peer of any violinist of the opposite sex now before the public, contains within and between the lines its own commentary:

It must not be forgotten that most of the girls who are dreaming of greatness, or whose parents are dreaming for them, possess "talent" only—talent in more or less quality and quantity. Now, talent allied to intelligence and determination is not to be despised. It is sufficiently rare, but it is not that God-given divine fire we call "genius," a gift accorded only to the elect! Genius is a law unto itself; it surmounts difficulties over which mere talent must plod step by step. It "arrives" and can-

# OUR YOUNG FOLK

## Matoaka, the Princess Pocahontas

MANY boys and girls will not recognize under the name of Matoaka their old Indian heroine and favorite, the Princess Pocahontas. In *The Insignia*, a paper published in California as a special organ of the red men in that State, the story of Pocahontas is told with some details not heretofore given.

The writer describes the adventurous career of Captain John Smith, whom Matoaka rescued from death. Between the ages of thirteen and five and twenty he had been page, soldier, hermit and pirate. He had been cast from a ship into the sea because the sailors believed he carried ill luck with him, but managed to get to land. He had fought three Turkish champions who came out against the Austrian troops with whom he had thrown in his lot, and defeated each in turn, thus winning great glory. He had even been sold into slavery, but escaped. So when he found himself a captive of the Pamunkee Indians in what is now Virginia, and on trial for his life before their great chief, Powhatan, John Smith knew what danger was, and had learned the value of courage and presence of mind.

This time nothing could have saved him, however, had it not been for Pocahontas. The Indians treated their captive hospitably, offering him water to wash with and a towel made of feathers, and placing food before him; but meanwhile they were consulting and the result of their council was that John Smith was condemned to die. He stood waiting for the death blow to be struck, when Pocahontas, then only twelve years old, threw herself between the captive and his executioners.

Powhatan was then in a very embarrassing situation. He did not wish to change his decision and thus lower his dignity as a judge, and he could not bear to ignore the petition of Pocahontas, his favorite daughter. The Indian councillors behaved with great tact. They had hearts too, and felt that such heroism as Matoaka's should earn a response. So they begged Powhatan to spare the captive's life. He was glad to escape the humiliation of seeming to yield to his daughter and willingly consented to spare John Smith and accept him as an attendant for Pocahontas. John Smith was received into the Chief's family; but he did not remain there long, as by means of his own sharp wits and help from Pocahontas he escaped, and returned to England.

Later it was the fate of Pocahontas herself to be taken captive by the settlers. She made herself beloved by them and learned to live happily among them. It was when she was

### ON THE HILLSIDE AT POINT LOMA

#### I WILL!

I WILL start anew this morning with a higher, fairer creed;  
I will cease to stand complaining of my ruthless neighbor's greed;  
I will cease to sit repining while my duty's call is clear,  
I will waste no moment whining and my heart shall know no fear.  
I will look sometimes about me for the things that merit praise;  
I will search for hidden beauties that elude the grumbler's gaze;  
I will try to find contentment in the paths that I must tread,  
I will cease to have resentment when another moves ahead.  
I will not be swayed by envy when my rival's strength is shown;  
I will not deny his merit, but I'll strive to prove my own;  
I will try to see the beauty spread before me, rain or shine—  
I will cease to preach your duty and be more concerned with mine.—*Selected*

baptized as a Christian that they learned her real name, given her at birth, was Matoaka.

In a few years Matoaka was married to Captain John Rolfe, an Englishman. Governor Dale and Powhatan both gave their consent to the marriage, which took place in Jamestown. The young pair went to England, Pocahontas being the first Indian princess to visit the English court. Captain John Smith had written to the king about her, and King James received her with all the honor befitting a princess. But she was inconsolable because her old friend John Smith did not approach her with the warmth and familiarity of former days. He stated that it was not seemly for one of her high rank to consort with those of his station in life, and said that if she were seen in his company the courtiers would not regard her with due respect. Poor Pocahontas did not understand this; she had

a simple, loving heart, and perhaps cared more for old friends than for courtiers. England was not a home suited to one of her free woodland upbringing; civilized life was hard upon the Indian princess, and though Captain Rolfe made haste to prepare to return to America when he saw that she was losing her strength, Pocahontas died before the ship sailed. This sweet, brave American, however, did not perish without leaving a little daughter, through whose descendants several honored families in Virginia are a link between the present day and Matoaka, the Princess Pocahontas. G. I.

#### "Whatsoever a Man Soweth, That Shall He Also Reap"

THERE was once an old man, runs a story told long ago, who had grown very feeble with age and whose hands shook so that when he was eating his food he often spilled some of it upon the table-cloth. This annoyed his son and daughter-in-law very much. They were not kind hearted people, you see, and to escape being annoyed by the spilling of the food they made the old man sit over in a corner by himself and eat his food from a heavy earthenware dish, very different from the delicate china used at their table. They were so careless that they even forgot to see that he had enough to eat. The neglected old man would often look wistfully over to the table where they were sitting, but he did not complain.

One day his hands shook so that he let his heavy dish fall and it was broken to pieces. The son's wife was very angry. She brought him a plain, cheap wooden bowl to eat from, and was less careful than before to see that he had enough food.

One day his little grandchild, who often played about the room while his parents and grandfather were eating their meals, began to collect little pieces of wood. His mother said to him, "What are you going to make, Hans?"

"Oh, I am going to make a little trough for you and father to eat out of when I grow up to be a man."

His father and mother looked at each other for a moment. They realized how unkind they had been to the boy's grandfather, and what a lesson in unkindness they had given their son. They changed their ways and henceforth treated the old man with respect and kindness. Their little son had taught them a lesson they never forgot. FRED A

AFTER all it is not what is around us, but what is in us; not what we have, but what we are, that makes us happy.—*Geikie*

# THE CHILDREN'S HOUR

## NIGHTFALL IN LOMALAND

IT'S time, little flower, to carefully fold  
Your petals of gold!  
It's time, little singer, to fly to your nest,  
The sun's in the west!

Soon in the silvery sea does it sink,  
Before you can wink.  
Your friends will be sleeping, the linnet and lark;  
It's night! It is dark!

The wind will be hurrying out from the caves  
To tumble the waves;  
The troops of King Neptune be storming the shore  
With deafening roar.

But sleep, little flower, and peacefully dream,  
While over you gleam  
The star-eyes of heaven. Your fairy stands near,  
You can not have fear.

And sleep, little bird, on your twig in the tree,  
So fearless and free,  
Awakened to song by your own guardian fay  
At dawning of day.—Student

## Shells

A FINE collection of shells is almost as beautiful as a garden of flowers. There are so many different kinds of shells, of all shapes and sizes, with such lovely soft colors and such beautiful markings. You find yourself saying oh! oh! oh! all the time that you are looking at them. The Shell Lady who lives on Point Loma has a most wonderful collection of shells, which she loves to show to children.

The first shell that she brings out is a mermaid's cradle, eight inches long. It is big enough, quite, for a baby mermaid. Then there are others of the same kind, not so big, that are colored inside with the softest shades of coral and pale green and blue. Just the right size these are for the sea fairies to rock in. As you look over all the different kinds of shells you find out that the kingdom of the water is very much like the kingdom of the land, for it is filled with so many of the same kind of things. Whoever would look, for example, for a flag in the sea? Yet the Shell Lady has a flag-shell that has broad stripes of orange, black, and white all around it. There are cup-and-saucer shells, and many shells like soldiers' caps of different kinds. Some are just like the bronze helmets of Japanese warriors.

One of the loveliest shells is the Harp of Ventricosa. It is shaped something like a lyre and has raised white lines running from top to bottom just like harp strings, and between these the spaces are colored and carved just as the spaces are on a beautiful harp.

One of the Shell Lady's cabinets has all its little drawers filled with shells whose family name is Cowrie. There are ever so many different kinds of cowries. Many of them are so pretty that the people on the coast of Asia make bracelets, collars, and headdresses of them. The cowries are usually oval shaped and so softly rounded and smooth that you would think they had been polished. But no, the shy little creature, who lives in the cowrie

Lomaland Photo. and Engraving Dept.

HANDWORK DONE BY THE CHILDREN OF THE RAJA YOGA ACADEMY, PINAR DEL RIO

shell, has a mantle that is like a thin, gauzy, living cloak, which he throws all around the pretty little home that he builds for himself. This makes the outside just as finely polished and shining as the inside. The cowrie family must really be artists for they paint their shells with the loveliest colors, and decorate them with quaint and curious markings. Some delicate gray and white ones have zigzag lines; others, waving ones with little spots and dashes all painted on in pale violet colors. There are tiger cowries and panther cowries, called so on account of their stripes and blotches of dark brown on a light tan background.

One large handsome cowrie shell is covered all over with rings and dots that look like eyes. It is called the Argus Cowrie, which is a very good name for it. Argus was the watchman of Juno, queen of the gods, and he had a hundred eyes, and never went to sleep with more than two of them at a time. He was a very good watchman indeed. When he was slain Juno placed his eyes in her peacock's tail, so the story goes, but I think she must have given some of them to Neptune who bestowed them on one of his cowrie children.

In the cabinet is one drawer filled with small canary colored cowries. These are so rounded and smooth and shining that they seem just made for children to play with. They are ever so much prettier than marbles. In parts of Asia and Africa these yellow cowries are used for money, and so they are commonly known as the money cowrie.

In the very center of the cowrie cabinet stands a large shell that is almost round, it is so high and finely arched. It has the golden orange color of the sun as it sinks into the sea. It is so brilliantly polished that it looks like

a piece of exquisite glazed porcelain from the cabinet of a Chinese emperor. This is the rare orange cowrie, the most beautiful cowrie of all. In New Zealand and the Fiji Islands kings and chieftains wear these beautiful shells hanging from their necks. They are badges of honor and high rank.

## Their First Glimpse of the Sea

A FEW years ago some Navajo Indians who live on the deserts of New Mexico and Arizona made a journey to Pasadena, California, to see a festival that was held there. Imagine their surprise when they saw the beautiful gardens and groves full of fruit-laden orange trees. When they saw the ocean they were overcome with awe at the sight of such a large body of water, they who pray ardently for rain enough to enable them to live. They looked and looked, trying to see the other side of the water. Then they stood reverently and appealed to the Great Water to come also to them, in rain, and they threw upon the waves that washed up at their feet an offering of sacred corn-meal. This was their way of showing their respect for the great ocean which was something new to them in Nature's works. Clouds and stars and the dome of heaven they knew and loved well, and their simple hearts were full of joy and gladness at beholding the sparkling sea. G.

LITTLE strokes fell great oaks.

All kindness begins in *purpose*.

A fine cage won't feed the bird.

To him that wills, ways are not wanting.

None are so fond of secrets as those who do not mean to keep them.—Selected

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogenesis  
Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

### The Power of the Press

WE are all for the predicted these days; and our own natural organs are given no chance of exercise. Why cannot we retain some respect for manhood and the functions of a man? A man stands erect upon two feet, his own; he is not quadrumanous like a monkey, all four limbs of him terminated by "pickers and stealers." Our origin was with the gods and heroes of a more magnanimous age, and we are daily reminded of things that find their echo deep in our noblest pride. If Darwin had put the monkey-state at the other end of evolution, now —

He could, in such case, or his followers could (for we have made the pace in that direction since his day), point to a lying, chattering press for evidence of his gospel; through which the news items which concern nobody, and in which nobody ought to take any interest, squeak and scamper and swing themselves from column to column in a perfectly aimless and hare-brained way. Flocks of them have no message but inanity, inanity dished up to tickle the brain; inanity dished up to cheat the pilgrim soul (who came down into this world to do something and think something), out of so many minutes and hours of

A Table of Unworthiness!  
A Feast of Emptiness!

the time given it for its grand purposes. God! the miles and millions of experience that we have to reap, that we should sit down to waste life, brain, and time, in reading the stuff that is printed! Vapor that the next breeze blows from the mind surface; a succession of which vapors will yet keep that surface eternally from the light of the sun. Dare we not stop the activity of that within us which craves for this kind of thing?

Someone has written a story of a Simian civilization which was to supersede this human one, and describes the attainments of the Bandarlog in the sciences and arts. The fall of humanity had come about through the wholesale invention of trouble-saving machinery, mental as well as physical, till the best equipped mind was the one least capable of original thinking or sustained effort; spasms were the royal road to every kind of grace and good. Then the Monkey people dethroned humanity, they having grander aptitude along these scatter-brained lines. Mankind, being still as you

The Signs of Unbalanced Mentality

might say tainted with the aftermath of soulhood, sank handicapped into servitude, and then into extinction; while the culture of the quadrumana swung and jabbered itself across the world-stage. The lectures of monkey-

savants were made, somehow, into easy pills, to be swallowed by prehensile students swinging from the gasfittings; who, thus suddenly made wise, would as suddenly swing off to swallow the pillulated wisdom of other professors.

Give us but time, and we shall swing from tree to tree with the best of them, as our nimble minds swing off from thought to thought now. The modern newspaper of a certain type is simply qualifying itself for the simianization of itself and readers, and is not to be read without deterioration. Its whole object is to fill up so much time in the reading, to waste it: for the matter has most of it been written before in some other publication; re-written from that with nothing new in the way of an idea added.

Needed:  
A Worthy View of Human Life

Why should we be fobbed off with such substitutes for reading matter? Because we can hardly think ourselves, or tolerate the thoughts of another. Because we have almost forgotten that the mark of a man is his power to think, to evolve thoughts out of himself; not to let other men's thoughts or apologies for thoughts float through him, but to push out, to be a man at it, a mind, Manas. The most obvious thing about whatever is written, or shall we say the last and most enduringly obvious thing about it, is the motive that prompted its writing; if there was nothing in the writer's mind the whole thing will reek with stale vacuity, and no smartness will redeem it. When you take the good things that another man has written, and write them as your own, they will bear the stamp of the last mind that handled them: your own mediocrity or original thought will be the thing on the surface, and the thing beneath. Had you anything of your own to say, on the other hand? Scissors and pastepot would hardly disguise it. You are never so dumb or illiterate but it will be out; your message will inevitably be spoken, and something of your production will go to the world's store of honest mental food.

Ephemeral Thought the Mark of an Ephemeral Civilization

Let but a man think, exercising the heart and mind which are the nearest raiment of himself, and he is weaving universes out from his own being, bringing into play divine powers, actually creating; altering and modifying the springs of the world's action.

Without such source in real thought, all action and all your business are but the pounding and clatter of a foolish stampede; much dust is raised no doubt, but has there been any advance? So thought is in a sense greater than action, because the better part of ac-

tion; yet whoever puts the gloss on that, that we may stop at thought without going forward into deed, advertises thereby some deep defect in his own power to think.

The press might be among the most powerful agents of evolution; it might circulate about the world currents and currents of clean and virile thought, actual food and purification; it might be inspired human divinity, instead of human monkeyism. We know the old excuse, that the public only gets what it demands; but is that to remain as it stands, that assertion, and is nothing more to be said about it? Does the public really demand all those sheets of divorce news, crime news, and squalor? Or is it that all those sheets must be filled up with something, and that there is such a miserable poverty of ideas about, that nothing better can be provided? K. M.

### The Press and the Apaches

THE French Ministry of Justice, it is said, has recently issued an order to the police to the effect that no portraits of the notorious "Apaches" of Paris are to be furnished to the press, nor any accounts of their exploits. It is very rightly alleged that all such publication ministers to the vanity of these young criminals; they become heroes at once among their associates; they have figured in the public eye; they are famous men now, and others less fortunate will aspire to emulate their fame and deeds.

All this is very true, but the student of Theosophy knows that there are much deeper reasons for the excellence of the course M. Briand has taken, than these. All the ideas and thoughts and feelings of mankind are floating about us; streams and streams of them pass and encircle us continually. Our own general mediocrity brings to us mostly the more mediocre kind of these, as the moderately evil thoughts we are so familiar with, which will not bring us into the hands of the police, and the moderately good, which do not go far towards the salvation of the nations. Then too, we are, for the most part, on the look-out through eyes and ears, and wrapped in the panorama that passes before us outwardly: so that these thought-mists do but flit dimly through our minds, half-noticed; although entering, they obtain no lodgment. The morbid indeed are torn and devoured by them, and the more we are at their mercy, the less are we to be considered sane. If we were as we should be, they would never come to us; our minds would be held firmly in our own grip, and would be potent tools, not channels.

Whatever we read, and whatever we notice—some ghost out of this gray legion is called forth and made to stand out and play his part before the mind's eye. Memories connected with the matter before us crowd around, and old, half-formed thoughts leap out from their native obscurity, and act, act, act. The message of their play-acting is always the same in effect: *Go thou and do likewise*; for repulsion and its opposite have the same hypnotic and psychological value. You cannot read the description of any crime, and be interested in it, but the whole thing is being committed in your own mind by these vital actors, who all through their acting are discharging their subtle poisons at you, col-

oring your being, molding your life along the lines of their base drama; with the greater success the weaker your character may be, or rather, the more capable of receiving impressions.

What might be done for a nation by a pure and dignified press? *What might not be done?* All police news, all the columns dealing with the sordid side of life are invoking the forces of corruption in the minds of millions every morning and evening; and some of these take little or no outward impression from what they read, and some have their character sapped and withered within them, and all their possibilities go. And between these are all those who are degraded infinitesimally each day; coarsened just a little, moral sense a little more dimmed; ideals ever a little farther and fainter. We know well enough that to eat bad food will bring physical degeneration to a race; is it so hard to realize the truth about this perpetual consumption of bad mental food? It must perforce bring down a nation generation by generation, till there is no place for it in the world but among the subject and inferior peoples; till there is no place for it in the world at all, and it must die out and no more encumber the earth. STUDENT

### Lemuria's Grave

"THE Pacific Ocean," says Principal Blackman, of Alluolani College, Honolulu, in *The Geographical Magazine*, "remains today the most explored but the least known extensive region of the globe."

In order to remove this reproach, the science of Honolulu has gathered itself together and founded the Pacific Scientific Institution. This purposes to get to work and stay at work for fifteen years, exploring peoples, fauna, flora, islands, and ocean. The whole of the results will then be elaborately reported. The program is evidently very large and will require and get the co-operation of scientific experts in many branches.

A careful and elaborate series of the languages, religion, law, mythology, legend, and genealogy of each people will be recorded; their technology, art, and medicine will be exhaustively studied. Series of mammals, birds, reptiles, insects, and botanical specimens will be preserved; the coral reef, the marine flora and fauna, the ocean currents, the geology and meteorology, will all be investigated, until the whole realm of nature has yielded up its store of scientific data.

The investigators will demand of the Pacific its final secret, how it came to be. The article mentions the two leading hypotheses: That the basin is the hole left behind after the moon was flung off; and that the ocean has filled in over a sunken continent.

But it is not a clean hole at all; it is dotted with innumerable islands, the apexes of pyramids whose bases rest on the bottom. The first hypothesis therefore goes out at once, to say nothing of the fact that the moon is much older than the earth, is indeed obviously senile or dead, old enough to have been (*it was*, says Theosophy) the earth's parent. "What is the import," asks Principal Blackmann, "of the presence of the same species of a fresh-water fish in two rivers situated on two opposite sides of the Pacific?" Why is there a volcanic system extending all round the basin? A sinking continent would naturally force or squeeze this up from the crustal depths.

The peoples inhabiting the islands of Polynesia fall into three main groups: the blacks or Papuans, negroid, mostly of very low type and civilization; the browns or Sawaorians, of very much higher type; and the intermediates or Tarapons. The blacks are doubtless, like the Australian aborigines, degraded Lemurian remnants. The browns, if from India or the Indian Archipelago, were pre-Aryan, for their speech has no Sanskrit roots. But there are any number of problems connected with both which the research may possibly clear up. It will not come a moment too soon; for year by year, legends, traditions, and ritual, are fading out of the peoples' memory. Says the article, speaking of the Sawaorians:

The elaborate religious system of this people had attained a perfection and elaboration of ritual such as has been equaled by few other peoples. . . . The tremendous irrigation tunnels by which mountain ranges were pierced required alike great mechanical skill and some knowledge of the principles of surveying. Their elaborate code of water rights, their knowledge of the movement of the heavenly bodies, their familiarity with the currents of the great ocean and their protracted voyages thereon, their evolution of a system of writing, are all matters which excite our admiration and bear testimony to the fact that the Polynesians . . . had developed a culture which compares favorably with that possessed by other races at the dawn of authentic history.

Speaking of Rapanui, Easter Island, the writer says:

This latter insignificant output of Polynesian culture is distinguished as affording specimens of that remarkable ideographic writing which lifts the race well above the plane of savages and proves it to have advanced toward a culture worthy of comparison with primitive civilization. The deciphering of Rapanui records has not yet been accomplished, but its solution should be achieved when all specimens of the art have been assembled for comparison.

Of the statues on that island, or of the extraordinary archaeological remains of three or four others, the article says nothing; but the report will doubtless reopen the question of their authorship, a question that had lapsed from its very insolubility. According to Theosophy, in the course of their millions of years they have seen three submergences. For the old continent is very restless. STUDENT

### Wireless Telegraphy for Finding Longitude

IT has been proposed to enable sailors to ascertain their longitude, independently of reliance upon a chronometer, by telegraphing to them from the Eiffel tower the correct Paris time. By this too, they can regulate their chronometers. Wireless messages can be sent from the tower, it is said, to the limits of a radius of 1200 miles. From the peak of Teneriffe, it is believed, all parts of the Atlantic might be thus reached. A.

### Chinese Students in America

A REPORT speaks of the convening of the Chinese Students' Association, and of its being addressed by the Minister, Wu Ting Fang. The students have exhibited the same high capacity as the Japanese. The Chinese Government sends one hundred a year, mostly to New England. It will not be long before China can imitate Japan in providing Western education at home. T.

## Some Views on XXth Century Problems

### The Only Sane Man

THE mystic, peering morbidly into his own mind . . . casually remarks a contemporary critic. The mystic, in his view, is one who has degenerated into loss of the creative urge, the urge onward, and can now only pry into consciousness in order to find out how its slackening wheels go round. No more than a schoolboy does the critic seem to understand that a purely subjective activity can be exultant progress. There must be something stagnant and degenerative about it. Mr. Whibley — *American Sketches* — quotes a Bostonian as saying to him, "Wait until we get a bit degenerate, and then we will produce a Shakespeare."

The mystic is, on the contrary, the man who is never content with what he has gotten or become; he looks forward to what he will get and become; he finds his life in climbing higher every day, disregarding everything that he now has or that is below him. The only way to get light on personality is to throw it aside and climb; the only way to understand mind is to transcend it. It is the metaphysician of today, not the mystic, who stays with the mind, thinking to make it solve the mystery of itself and the universe.

The mystic is an absolutely commonsensed person. He wants the Light which is Life. So do other men; he differs only in *knowing* exactly what he needs and making straight for it along one of those paths which all will sometime travel. He is the only strictly sane man there is. Because he looks forward and upward he must be happy, radiantly so. The desire to get the Light becomes the desire to serve it; and that desire presently reveals itself as the desire to serve his fellow men. He is an artist, creating before others' eyes and minds the image of the light he has seen and is approaching. He does it as he breathes and in every thought.

STUDENT

### Flattering Spirits

A SAN FRANCISCO youth of 25 years of age has been attracting some attention by writings purporting to be explanatory of *Revelations*. He is nearly illiterate and believes that he is the direct exponent of the Spirit of God. He was "chosen" to deliver a message to the world. A number of distinguished divines, including a professor of a Theological Seminary, have called upon him and put him through a three-hour examination.

"I would not question for half a minute," said this last, "that Mr. — feels the voice of God speaking in him. . . . Many persons have had this experience."

"Thousands of persons since the time of Christ have had revelations," said another of the examiners. "We walk in the Spirit as we walk in the atmosphere. You can't have a holy inspiration or desire without an ingress of the Spirit. There is an abundance of literature on the subject and a great many books of this type have been written, but a little more social than the manuscript here." (Which contains 100,000 words.)

"But have they been signed with the name of Christ?" asked a third. "No one has dared to do that?"

And the second admitted that to his knowledge no one has heretofore dared to do that. Nevertheless examples are very frequent, some now living.

The Professor sums up: "There is no doubt that — is a good, earnest, devout boy all the way through, who has caught ideas floating in the air that come to him with the force of a revelation."

The examining committee may have injured the boy more than they realize. They have probably fixed for him a conception of himself which might otherwise have died from inanition — that he is the mouthpiece of God and entitled to sign the name of Christ to whatever ideas float up automatically from the depths of his subconsciousness. Can they not see that the real inspiration was *vanity*? How many more "prophets," "Elijahs," "John the Baptists," "Israfels," and the like, must spring up with their "revelations," attract their following, and finally disappear like exploded balloons, before the public learn what vanity, often subtle enough to simulate humility itself, can do in its stimulation of, in its workings upon, unbalanced minds? Was one of these prophets and revealers ever inspired to declare that *someone else* was inspired? No; it is always to *him* that we are to look; *he* alone has at last the truth for which men have been waiting for countless ages. These people will pat the Bible on the back. Yes, that book was very well in its day, but you cannot understand its last secret without *my* comments and addenda. *I* have the key withheld till now.

Their possibility lies in the historical ignorance of the public. When the majestic procession of civilization is appreciated; when the Bibles of humanity are ranged alongside of our own; when the Wisdom-Religion that never was not on earth, and underlies all the partial presentations of it that we call Religions, is studied direct as Theosophy and indirectly through the rest; then the chance of vanity will be ended. The youth in the back street and the fulminating Elijah on the platform will be estimated exactly for what they are, and — pitied.

### The Fruit of the Half Truth

A BAPTIST organ, questioning into the cause of the modern lowering of moral standards, finds it chiefly in the theory of evolution.

As the fundamental principles of evolution have permeated through all classes of society, men and woman have been glad to accept the idea that they are the products of antecedent causes, and are therefore not responsible for what they are nor for what they do.

But suppose "the fundamental principles of evolution" happen to be true, how then? The answer would doubtless be that there is a part of man to which those principles do not apply, a part governed by other laws: that

whereas the brute part of man came from nature, the soul part came from God.

Now for centuries the church had in its sole hands the teaching of the people in all religious and philosophical matters. It taught that the soul fell into utter mire from the eating of an apple. Then, slowly, the apple business — its obvious symbolism undetected — fell into the background. The attempt to account for the "origin of sin" in that way was renounced. But the sin remained; the heart or soul of man was universally agreed to be "desperately wicked" and to be in urgent need of salvation. It was thoroughly rubbed into every man, woman and child, that of himself, so utter was his degradation, he could do nothing. His nature was animal and selfish. Only an extraneous power could save him.

Was not the way thus perfectly laid, by *theology*, for the acceptance of the evolutionary biological theory in its crudest form? Man had learned that he had the vices of the animal; now he learned that was but natural, for he was actually an animal. Having learned nothing from theology concerning the soul, except that in its desperate wickedness it needed salvation, he had formed no conception of it as a being *within* the thinking animal.

So it is useless for theology to blame science. It is itself the sinner. For centuries the idea of human radical wickedness was gathering heavily in that mental atmosphere which the soul has to breathe from the moment of its incarnation. The child was never taught that he is not the desires that pull him downwards; the man was never taught that he is not the lower mind whose stream of thoughts he might steady and guide. In the whirl of both, the personal soul is now nearly powerless and utterly self-unrecognizing. But if through the centuries the child and the man had been taught that they were divine, with complete power over mind and the animal, *that* idea would be in the air, and no teachings of science respecting the evolution of the *animal* would have harmed anybody.

### The Latest Doll

FASHIONABLE hostesses are now providing "silence rooms" whither their fair guests may retire for the development of their psychic powers. This is accomplished by gazing at colored balls hung from the ceiling.

One is very improperly and reprehensibly reminded of the poor wife who had to delay sweeping the room until her husband had finished some athletic exercises with the broom handle.

For of course these ladies never would darn stockings or socks anyhow.

Still, balls of wool *are* of various pretty colors; and darning *may* be done in silence. So what would be lacking for the development of the grandest psychic results? You have your colored balls and your silence.

But perhaps the ignoble feeling of doing something useful would be in the way, soiling that "art for art's sake" feeling.

## Were the Egyptians Idol-Worshippers

THE charge of idolatry and animal-worship has been a popular one to bring against the ancient Egyptians, the learned and the multitude being classed together by those who would admit the existence of no important spiritual life in antiquity except that of the handful of inhabitants of Palestine who worshiped Jehovah. Fortunately this is rapidly changing and we are allowed to breathe a freer air in which the facts about religions are no longer stifled. The narrow views which have so long psychologized humanity are disappearing. Dr. Budge, the learned Egyptologist of the British Museum, says in his recent work, *The Gods of the Egyptians*:

"It is easy to bring a charge of being half-savage against a great nation, but in this case the charge is ill-founded, and is, in the writer's opinion, contradicted by every discovery which is made in Egypt; for the more we learn of the ancient Egyptians the more complete and far-reaching we find their civilization to have been." (I, 118)

Holding this view, which is exactly what H. P. Blavatsky was severely criticised for presenting years ago—it is no wonder that he should write, upon the subject of religion:

"The uneducated loved a plurality of Gods, while the priests and educated classes who could read and understand books adopted the idea of One God, the creator of all the beings in heaven and on earth, who for want of a better title were called 'gods.' . . . The priests and theologians saw nothing incompatible in believing that God was One, and that he existed under innumerable forms." (I, 137)

But the Egyptians never committed the error of "making God in the image of man," and as H. P. Blavatsky points out:

"The one *Absolute* Cause of all, was as unnamable and unpronounceable in the mind of the ancient philosopher of Egypt, as it is for ever *Unknowable* in the conception of Mr. Herbert Spencer."

She quotes Maspero in corroboration, who says of the Egyptian in general that when he

"arrived at the notion of divine Unity, the God One was never 'God' simply. M. Lepage-Renouf very justly observed that the word *Noutet, Noutti*, 'God,' had never ceased to be a generic name to become a personal one."

Emanuel Deutsch opines that the manifold forms of the Egyptian Pantheon were nothing but religious masks, so to speak, allegorical embodiments of that originally pure doctrine communicated to the initiates in the mysteries. E. de Rougé, Mariette Bey, Pierret, Dr. Brugsch, and the rest of the modern authorities agree with Dr. Budge in the high appreciation of the nobility of the Egyptian conception of the intelligent control of the universe. The last says that the collection of texts made by Dr. Brugsch which speak of the known manifestations of the Unknown divine Unity including all forms of Power, "would be difficult to find a parallel for outside the Holy Scriptures." By "Holy Scriptures," the Holy Scriptures of the Jews are meant, but it is not quite so difficult if we only look in the right places, such as the Hindû *Bhagavad Gîtâ*, the Sufi writings, or the *Zend Avesta*, for instance. H. P. Blavatsky quotes a very apposite passage from the *Laws of Manu*, one of the earlier Hindû authorities:

"He that can be perceived only by the spirit, that escapes the organs of sense, who is with-

out visible parts, eternal, the soul of all beings, that none can comprehend, displayed His own splendor."

Some of Dr. Brugsch's Egyptian texts are as follows:

"God is hidden, no man hath seen his face. He is hidden from gods and men. That which was Unconscious existed in his heart at one time and advanced into reality and eternity at his Word. No man knoweth his Name."

The latter text proves that the God referred to was the impersonal Cause behind the manifested powers called gods, to which names were attributed. The use of the word god as a translation of the Egyptian word *Nuter*, which might be better called Power, is an example of the hypnotic effect of words.

But it was not used in the vulgar sense by the cultivated Egyptians, and a very valuable conclusion

Lomaland Photo. and Engraving Dept.  
THE EGYPTIAN HIEROGLYPH PAUT,  
SHOWING THE DIVINE FORCES (GODS) EMANATING  
FROM SUPREME RÂ

can be drawn from the comparison of the teachings of the Hebrew Kabala concerning the Powers or Sephiroth emanating from Kether, the "Crown," and the Egyptian Paut coming from Râ-Tum. Râ and Tum are not really two distinct gods of light, but represent the creative power in the Cosmos regarded from two aspects, the sensuous and the supersensuous. There are two series of Nine gods proceeding from Râ and Tum, and a third obscure one of which very little is known. The great series of Nine, according to Dr. Brugsch, over which Tum presides, is composed of Shu, Tefnut, Seb, Nut, Osiris, Isis, Set, Nephthys, and Horus, and seems to be the personification of the natural forces in the lower or physical world, the work of Tum. Here we see Osiris as one of the Forces, but sometimes he is Râ himself. The way the Egyptian gods interchange attributes and names is a difficulty that immediately presents itself to the student, but it really only shows that the spiritual forces change their relative appearances according to the point of view from which they are being considered at the moment. The confusion is apparent, not real.

The hieroglyph shown in the cut accompanying this article represents the Paut. At the top is the solar disk, the sign of the god of Light, Râ; and the three branches are said to mean "going out, emanating." The buds on the branches represent the Nine emanating Powers or gods. This symbol strongly resembles the "Kabalistic Tree."

The highest authorities have elaborately discussed the question whether the Egyptians learned these and similar esoteric teachings from the Hebrew Kabala or whether it was the other way, and there has been a general disinclination to admit any definite connexion between them. From the standpoint of Theosophy there is no need to trouble about the constant efforts on the part of archaeologists to trace one national symbology from another, for the fact is that they all come from the same source, from the great International Brotherhood, whose members are the sworn guardians of the Esoteric Doctrine. This knowledge is not guesswork, cribbed from some daring inventor, but is derived from actual observation, and it has been symbolized throughout the ages in different ways according to the temperaments of the different nations, but there has always been a fundamental agreement. For instance, the cross is found everywhere, and far antedates the teachings of Jesus.

The essential difference between the Theosophical view of the matter of symbolism and that of the academic archaeologist is this: Theosophy asserts and proves that there has always been an esoteric wisdom, common to all the initiates, to which all those who truly "led the life" had access, and which has left traces of itself in every quarter of the globe. Modern archaeology knows nothing of this yet. The Teachers helped the people in the best way possible, but it was never safe nor desirable to unveil the whole truth openly, and so while they taught the highest morality, they hid their deeper knowledge about the powers in man and the cosmic forces in nature, over which control can be obtained, under various glyphs, unintelligible to the uninitiated, and not understood by the modern scientific investigator who has not obtained the password into the arcana of these Mysteries. Though a good deal is known about the surface meaning of the Egyptian hieroglyphs and the arrow-headed characters of Babylonia, even Dr. Budge, a high and modern authority, admits in his work just mentioned that the Egyptians attached the greatest importance to the correct pronunciation of the sacred texts. If this was not known the mere words were of comparatively little use in the ceremonies. We have the shell, or part of it, but there is far more concealed than revealed. It has been suggested that there is a secret method of reading the hieroglyphics; that they are a kind of acrostic whose key is lost! Hermes Trismegistos, the Thrice-greatest, said, ages ago: "O Egypt, Egypt, of thy religion fables only will remain, which thy disciples will understand as little as they do thy religion!"

We can say with truth that the moral teachings of the Egyptians are known to us, and they are of such a high grade that we have certainly not improved upon them. "Not one of the Christian virtues," writes Chabas, "is forgotten in the Egyptian code: piety, charity, gentleness, self-command in word and action, chastity, the protection of the weak, benevolence towards the needy, deference towards superiors, respect for property in its minutest details."

In ancient Egypt we find a civilization complex and advanced, and we have to admit that many of its most striking and peculiar characteristics are not yet fully understood; a religious philosophy of the

## Malice and Metabolism

**A** NEGATIVE variety of mental preventive healing appears to have been medically orthodox and official in Tibet 1200 years ago. It was based upon the last of these sentences, quoted from an ancient handbook of medicine which has just been examined and authenticated by the Russian Academy of Medicine:

The heart is the king of the organs and the staff of life; the lungs embrace it as the mother does her child. The liver is the human body's cook-stove. Sickneses are due to man's malice, ignorance, and inability to curb the passions, for these things interfere with the proper nourishment of the organs. All unkind thoughts react upon the heart and liver.

The causes of disease fall into two classes—ignorance of the common laws of hygiene, and certain mental states, malice and passion, leading to interference with the nourishment of the organs, with metabolism, in modern phrase. The mental part of the treatment, dealing with the larger group of causes, consisted in active benevolence of *thought*, leading of course to act. Nothing is said about "assertions" or "affirmations." Possibly these old fellows knew that self-hypnotism by formulas, if successful in affecting the body, was only laying up trouble for future use.

But may it not actually be that malicious and unkind thought, persisted in for generation after generation, handed on cumulatively, is now at last the chiefest cause, not so much of our actual diseases as of the universal tendency to disease? Did the ancients develop out of nothing the rather recondite idea that hate and malice and passion affect metabolism injuriously? Faulty hygiene and diet might turn out to be quite inconsiderable factors in comparison with the mental state of unbrotherliness.

STUDENT

## Inherent Natures

**B**OTANISTS still question why a seedling's primary rootlet grows downward and its plumule upward. "Inherent tendency" is so far the only complete answer, and it is a perfectly correct one. But though botanists have to give it, they do not like it. No more than other biologists do they like living matter to presume to have inherent tendencies. They want it to be entirely passive in itself, doing whatever it does in mechanical response to external forces. So the rootlet grows downwards because of gravity. This is perfectly satisfactory till it occurs to you to ask why gravity does not also make the shoot grow downwards. Why does that defy gravity? It wants the light; it is "heliotropic." Well why does the original seed cell divide into two, each of these finally becoming a group, so that there result two groups so different that one wants light and the other earth? The only possible answer is: because such is that cell's "inherent nature," translate those words into any language you like. Everywhere in Nature "inherent natures" are to be found; everywhere, pushed to the last extremity, final phenomena have to have that

explanation. The roots of things have "inherent natures." To get behind them, to understand them, we have to understand Nature in a fuller sense than science has begun to think of. To find the reason of and in any one unit's "inherent nature," we must find the Reason in Nature, touch her consciousness and learn her plan. For every unit has its bit of the plan to work out.

## A Theory of Rain

**A** LITTLE girl of twelve years of age writes to the *Scientific American* an exposition of her (!) new theory of rain. She has submitted it to Professor Loveland, of Nebraska University, she says; and now modestly asks some chemist or physicist to "fulminate some little fact" into her theory "that will resolve it into gas thinner than those with which it deals." She is "entirely willing" that this should be done and only asks for notification when the shooting occurs.

The electrolysis of water is the use of electricity to force asunder the oxygen and hydrogen of which the water molecule consists. When these elements recombine they yield back the energy spent in sundering them, this partly taking, suggests the little girl, the form of a spark or sparks of electricity. If this experiment is done under a bell glass jar, the resulting drops of water will precipitate on the floor of the jar. In other words there is a shower of rain on a small scale. And the pop or bang is perhaps a microscopic thunder-clap.

The theory requires that there should be two sorts of rain showers. One of them has the cause ordinarily given for both—a fall of temperature in moisture-laden air, resulting in a precipitation of its moisture. The other is due to the combination of large masses of oxygen and hydrogen, suddenly; the flash of lightening is the energy thus liberated; the thunder is the noise of the combination—not, as ordinarily said, that of the rupture of air by the flash. The sudden formation of the water causes the extra downpour of rain so usually noticed after a thunder-peal.

Houses, trees, men, etc., may thus experience two kinds of damage: the disrapture due to the electric flash; the singeing and burning due to the heat and flame of the union of the gases—for some of the uniting energy appears of course as heat.

There are also two sounds: the snap or rip of the flash; and then, in a second or two, the roar of the combining gases.

But whence these gases? Oxygen is about a fifth of the air anyhow. It comes from the plants. There is therefore more oxygen, more thunder and lightning, and more rainfall, where vegetation abounds, along green valleys, watercourses, and tree-clad hills; and in summer.

The hydrogen, surmises the theorist, is the result of electrolysis of water, water in mass or diffused through the soil. The electrolysing current is the lightning of storms. Lightning, therefore, liberated by the com-

bination of oxygen and hydrogen, prepares for its own reproduction by separating on earth another lot of gases.

If the theory is to work, however, an additional source must be found for lightning; for some of the force which went, as electricity, into the water to decompose it, reappears in the recomposition as heat. Or else there is some force other than electricity which can decompose water. It is not perhaps certain that plants cannot.

Anyhow the hydrogen, once freed, ascends to the upper aerial strata, to be brought down from time to time by air currents. Once that it is present in mixture with a body of oxygen, the preparations for a storm are complete; the theory now requires a little spark of electricity from somewhere—the advent of which is not explained, but it need be a very little one—to start the combination.

The theory is very ingenious, and, with provisos, unobjectionable; moreover, considering its source, astonishing. If the child is really only twelve years of age we may rejoice that she can hardly be ruined on platforms like a piano-playing prodigy.

STUDENT

## A Glassful of Ether

**A**CCORDING to a paper read before the last meeting of the American Association for the Advancement of Science, not yet accorded its full importance, the ether has been experimentally captured as never before. The experiments were in two series, both reported and illustrated with a fine set of lantern slides.

It appears, then, that glass and probably other substances offer resistance to the passage of ether, which they render slower. The corollary of this was also found true—that ether can be rarefied, and presumably compressed in a glass vessel, the rarefaction lasting long enough to be easily observed. The result of this rarefaction is that rays of light, whilst not altered in rapidity, are reduced at both ends of the spectrum in respect of the amplitude of their vibrations.

Another set of experiments, measurements of light pressure, belongs with this one, though made by another observer. The pressure naturally varies with the material on which the light falls, and follows the theoretical calculations of Maxwell. On the following materials the pressure varies according to the numbers given.

One glass vane .....	1.0
Two glass vanes .....	1.7
Enclosed black vane .....	5.6
Silvered vane .....	11.5

The old question naturally presents itself again: why, if glass and other substances offer so much resistance to ether as to permit of its rarefaction inside shells of them, do not the planets show signs of retardation by friction?

Rarefaction indicates an atomic or particulate structure. What lies between the particles? An absolute vacuum, or a yet rarer and finer ether? Is there finality?

## How Do We Grow Our Figs?

HOW many persons know that the luscious, juicy fig is a *flower*? Yet a very slight examination of an unripe fig makes this quite clear. Imagine a big daisy folded inwards with the green part outside and the flowerets within, and you have something like a fig. The hollow interior of a fig is filled with hundreds of minute separate flowers, not unlike the yellow flowerets of the daisy. In the wild fig (the "Caprifig" or goat-fig), those farthest from the stalk bear stamens and produce the fertilizing pollen, while the rest are either seed-producers or neuters ("gall-flowers"). The whole interior is closed against the attacks of insects in general, and the "fruit" is really only the thickened wall or "receptacle" which carries the tiny flowers on its internal surface.

The Smyrna fig, which has been cultivated from extreme antiquity in the Mediterranean countries, possesses none but seed-bearing or pistillate flowerets, and yet it cannot produce its seeds until they are pollinated. Without this the fruit cannot ripen, but will fall off the tree when half grown.

The problem is, then, to carry the fertilizing pollen from the stamen-bearing flowers of the wild caprifig trees into the heart of the Smyrna figs so as to start them into activity.

Nature solved the difficulty ages ago in a most ingenious manner, by evolving a special wasp whose office is to carry the pollen from the ripe wild figs to the eatable cultivated variety. It is well known that thousands of different kinds of flowers are pollinated by bees and other insects carrying the precious golden dust from one to another in their search for honey; but as the fig flowers are shut in, this is an impossible method for them. So the wild fig has provided a generous quantity of suitable places for the tiny fig-wasps (*Blas-tophaga grossorum*) to breed in *within* the figs; these are the "gall-flowers," the neutral ones which bear neither seed nor pollen and are of no direct service to the plant. The gall-flowers are specially adapted for the accommodation of the *larvae* of the wasps, which live inside them until they reach maturity, when they have literally "eaten themselves out of house and home." The female wasps push their way out of the fig just at the time that the pollen is ripe in the flowers nearest the large end; and in the struggle — for there

Lomaland Photo. and Engraving Dept.

### THE INSECT THAT HELPS THE FIG TO RIPEN

(a) Calimyrna Fig, section of unripe fruit, showing seed-bearing flowerets before fertilizing (natural size). (b) Fig-wasp, female (greatly enlarged). (c) Same (natural size). (d) Fig-wasp, biting a hole in the "gall-flower" to release female. (e) Same (natural size). (f) Seed-bearing flower. (g) "Gall-flower," adapted to receive one wasp's egg.

is very little room to squeeze through — they get covered with the fertilizing powder; they then fly off to the nearest fig they can find. Urged on by a singular instinct or intuition they force their way between the protecting scales at the mouth of the fig and run about inside, seeking the gall-flowers in which to lay their eggs. In their desperate efforts to get in they lose their wings which can sometimes be seen sticking out. If the wasp has entered a caprifig it finds the gall-flowers in which to lay hundreds of eggs, but if it has gotten into a Smyrna or "Calimyrna" (California-Smyrna) fig, it meets with disappointment and can do nothing but run around aimlessly and eat what honey it finds until it dies, there being no gall-flowers there. But it has done its work, for the dust which covered it has been well distributed over the seed-bearing flowers, and the Smyrna fig begins to grow into the valuable article of food familiar to us. The wasp recognizes no difference between the varieties of figs

and so enters them indiscriminately. The duty of the gardener is to cut off the wild figs at the moment when the flies are making their exit and to hang them up in the Smyrna fig-trees so that the wasps will find the fruit ready to hand. This has been practised from time immemorial, though the rationale of the process was only satisfactorily established about twenty years ago by American botanists. The Smyrna fig was introduced into California in 1880, but until the tiny wasp was introduced no fruit could be obtained. There are other varieties of edible figs that do not require the aid of the insect, but they do not compare with the delicious Smyrna fig. LOMALAND BOTANIST

### A Gooseberry Lawsuit

THE story is told that in Austria there is a large gooseberry bush growing on the boundary of two farms, and that the two farmers have long been accustomed to gather each the fruit on his side of the fence. But at last they quarreled and had a lawsuit, followed by sundry appeals to higher courts.

The results of the final settlement, recently recorded, are that each farmer, as before, gets the fruit on his own side of the tree, but neither may cut the tree down. Furthermore that they do pay legal costs to the amount of 225 kronen each. The yearly profit from the tree is half a krone, but the judge told them that with luck they might make the tree begin to pay in 800 years. T.

### The Dog's Dentist

THERE is said to be a dental hospital for dogs in New York, with two classes of patients, the millionaire's dog, and the poor man's dog. The teeth are of composition, set in gold or platinum. Civilization makes amends for its introduction of caries, by introducing also one of its compensating advantages. Perhaps cows would be a good experiment for future animal dentistry; for one understands that dairy cows, fed on warm slops, develop tartar. T.

### Telephones For Forest Fires

IN the San Gabriel Forest, California, fifty telephone stations have been established to help the wardens in sending out fire alarms. The rangers carry portable instruments which they can connect with wire at any point, instead of having to waste time riding to a station. E.

## NEVER FALTER

George Elliot

NAY, never falter: no great deed is done  
By falterers who ask for certainty.  
No good is certain, but the steadfast mind,  
The undivided will to seek the good:  
'Tis that compels the elements, and wrings  
A human music from the indifferent air.  
The greatest gift the hero leaves his race  
Is to have been a hero.

## Theosophy and the World Today

A WORLD-WIDE awakening, a restless surging to and fro over the broad earth, a building up of new nations, a marshaling of the old into the lines of progress, a stirring of pent-up energies such as the world has never before known, a forcing to the surface of many conditions for men willingly or unwillingly to face—in all this that we see Theosophy teaches us to recognize the preparation, in fact the early stages, of a change in the order of life for the nations of the earth.

History records no similar world-wide movement. When the victorious armies of the ancients were opening up communication between peoples hitherto unknown to one another, vast continents were unexplored. When the great migrations took place, and stir and change and breaking down and building up followed the movement of the peoples, there were many lands untouched, irresponsive to the powerful urge that led to the formation of the European nations. Later when the oceans became the pathways and bold mariners girded the continents, and by their daring, linked far distant lands, there were still vast tracts, silent, waiting unvisited. But now the stir and movement is world-wide, and the conditions of life in the world are such in the twentieth century that we can follow day by day the manifestations everywhere of the spirit of unrest, the working out into act of a deeper, more universal need in the nature of mankind. It is this world-wide aspect of present day conditions which is particularly significant, and in which, Theosophy teaches lies a great hope for humanity.

A glance at the panorama, as it unfolds, is suggestive. We see nations, as in Asia, who have remained in self-sufficient exclusiveness for many centuries, now invaded by the modern spirit. The hour struck when they were to enter the ranks of modern progress, and they move into line, apparently having lost little by their long period of retreat. We see these Oriental nations demanding, and receiving, from the sovereigns, the constitutional rights for which the subjects of the monarchs of Europe contended so hotly in the Nineteenth century. We have accepted the fact that such an Oriental nation as Japan has been able to bridge in fifty years a gap which it has taken other nations cen-

turies to cross. The spirit of interchange and of inquiry would leave no record, no stronghold of spiritual or material development uninvestigated. What great secret of ancient association guides the peoples now to seek amid conditions so extremely foreign to them, an opportunity of mingling, of working together to spread what they have developed? The Sphinx looks down on modern Egyptians being instructed in responsible government by the inhabitants of a distant island. The old pathways of the Saracen are scenes of turbulent disorder which but invite the interference of nations of the European continent. Wild, long unexplored regions of Africa are now territory open to the operation of railways and canals. There are to be no more unexplored regions. Mankind in its quest for the conditions necessary for a new age is penetrating to every corner of the earth. The strength stored in Europe has spread to distant islands and continents as in Australia and in the Americas, where new nations are being formed on lands so old that history tells little of the great monuments that still stand, silent witnesses to the great periods of development now forgotten. Surely it is the recurrence of some ancient urge that impels these throngs to seek the environment where they as active participators can mold conditions for the new time.

An ancient urge, and a new urge, Theosophy says. For according to its teachings, more than one cyclic period of development for the human race has recently closed, and we do stand at a point corresponding to one reached in the far past—history tells nothing of it—and at the dawn of a new period the impetus for which is pulsing from the great heart of the universe and affecting the whole world, not one nation or locality merely but the whole world, because it is the special significance of this time that the whole world may rise into a higher degree of human life. The meaning of this crucial time is that if the conditions of life forced to the surface by the general surging and unrest, be faced and dealt with, in the spirit of compassion and wisdom, the evil conditions may be cast off, never again to have the same power over mankind. Theosophy teaches that if the energy, the new force that has been liberated, as Katherine Tingley says, can be directed into channels of work for the true welfare of the nations, only the best and most helpful institutions of human life shall pass on to the new time, only what will truly build on highest lines. But it is true that this great force at work may be seized upon by the evil-minded, the enemies of the race, and used to destroy humanity. The problem of every nation at the present time is then the recognition of the action of this new energy, the directing of it so as to permit, not suffering blinded humanity to be swept off their feet by it, but only the harmful, the degrading, the merely selfish and low to be disintegrated by it, and die, leaving all that works for good to flourish as never before. A time of choice for all nations is it. For all must take their place on one side or the other, and their subsequent history will reveal their choice.

The Helpers of Humanity would save the nations. They appeal to the hero-nature of all who have risen out of the narrow personal

desires and ambitions, to *serve now*, to renounce all that binds or fetters and offer *now*, pure, unselfish lives, purged, by a sublime renunciation, of all that might impede the energy pouring from the great heart of the universe to every human heart that truly loves its kind. O patriots, for this hour have your souls waited a thousand ages! Upon you who have won this destiny, Gods and unincarnated heroes look down in pleading. Fail not! Let every sweet and holy influence of nationality send its strength to your souls now!

To the Soul the appeal is uttered. The brain-mind has no saving power. The Soul it was that lived in ages long ago amid conditions which, enhanced by all learned since that time, may now return. Therefore is it that Theosophy was brought into the world, by H. P. Blavatsky, sustained by William Q. Judge and now spread far and wide by Katherine Tingley—that men might learn that they are souls, and rise in their divinity to save the nations in this time of need and opportunity. Therefore was it that Katherine Tingley established the International Brotherhood League. In days to come this act of our compassionate Helper will be recognized universally as having been done at *the right time*. It has already in its ranks those who have bled, who have suffered imprisonment, those who have worked nobly and unselfishly for their nation. Because *they* have responded to the appeal of the Compassionate, a healing influence has been shed over the people they unselfishly serve.

Katherine Tingley has said:

Humanity has long wandered through the dark valley of bitter experiences, but the mountain heights are again seen, suffused with the glow of dawn and the promise of the new golden age. The pathway is once more seen to that realm where the gods abide.

With the golden age it is natural always to associate the gladness and freshness of the child-heart, and so at this time when a new golden age is dawning it is in the Law that among the children a great work should be done. For the early years of childhood correspond in little to the golden age long ago when humanity had not fallen into the tragic heresy of separateness, and if in these years, among the children of all nations, the old knowledge of the soul and of divinity be awakened, there will go out over the surging unrest of the world that which will gradually work for peace among the nations. Here again Theosophy is at hand, with Rāja Yoga to meet the needs of the children. Those who have had any share in the establishment of Rāja Yoga schools in different countries, or those who have had an opportunity of observing the workings of Rāja Yoga at the world-center at Point Loma know well that in the compassion and the will aroused in the little students of Rāja Yoga lies a hope of redeeming the nations from the selfishness and weakness that threaten to bar humanity from participation in the gladness of the new life. For humanity is made up of souls, a nation is a group of souls, and only by individual self-conquest can the leaven of brotherhood enter the national life.

THE block of granite, which was an obstacle in the pathway of the weak, becomes a stepping-stone in the pathway of the strong—*Carlyle*

# THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** If, as you say, "Life is Joy," why is there so much misery everywhere among men?

**Answer** Real life is joy, and men are miserable because they are not enough alive. A healthy, active, intelligent, moral nature could not enjoy a diseased, idle body, with a clouded mind and surrounded by vice. Disease, ignorance and selfishness have a painful and paralysing effect upon the powers of physical, mental and moral enjoyment. Considering what life might be, must we not confess that the average individual is half dead and asleep to his possibilities?

The human body is the most perfect of all the animal forms, most powerful to control nature's forces, most skilful in action, most sensitive to enjoyment. Yet we must needs turn to the animals below us to find creatures fully alive to the use and enjoyment of the physical life possible to their bodies. The fishes can teach us ease and rhythm of muscular movement: the cat tribe excels us in grace and agility; almost any dog has a better respiration than his master or mistress, and a blood that heals his wounds more quickly. The domestic animals are so accustomed to the natural sense of well-being that they neither withstand sickness nor respond to treatment as man does. Human lungs are often crowded into constricted and inactive chests and given vitiated air to breathe. The stomach is supplied with excessive or improper food. The muscles are heavy with retained waste and different groups suffer from disuse and over activity; the nerves are worn with strain and anxiety: every function of nutrition and waste, of creation and disintegration is damaged and deficient from artificial methods of living. Even physically there is not much joy in a body which suffers from alternate indulgence and punishment, from a round of gratification, disease, and drugging. Almost everyone is so adjusted to some familiar weakness, some pet ailment, or secret ill which discounts all his plans and pleasures that he does not even imagine the joy of freedom from his limitations. In civilized society, which ought to be the most alive to its possibilities of higher enjoyment, there has grown up a complex play between the broken law and the means for evading its penalties. New flavors are offered the jaded appetite; over-eating keeps pace with more digestive medicines, while the keen edge of a natural appetite becomes a forgotten pleasure. Modern dwellings have increased water supplies and bathing facilities while modern sanitation everywhere diligently cleans up a world that progressively suffers the magnetic and material taint of a diseased and self-indulgent humanity. The facilities for travel, rest, and recreation barely keep pace with the restless, unsatisfying strenuous life which wears out the nerves and starves the better nature.

Think of the joy of living in a strong, healthy, disciplined body, one which would respond with ease and certainty to the controlling will, one properly nourished and free from clogging waste, with pure blood to up-build an active brain and with appetites regu-

lated to normal needs. Think of the freedom and power and enjoyment with a body like that. The Japanese have recently taught the world a practical lesson in the occult power of disciplined will to make the body a valued and obedient servant. Though of small physique these people have so developed their powers of endurance by all-round discipline as to easily out-march our best American troops when in China, and in the late war to win victory from the larger but self-indulgent Russians. To a people with the patriotic devotion of the Japanese surely they have more joy in their victorious country than could be gained by selfishly indulging the personal senses. Moreover their trained bodies are skilled instruments to win in the continued individual fight which each man wages with his own weaknesses.

Much misery results because men are not mentally alive enough. It is easily seen that ignorance and stupidity operate against the larger joy of living. But so does the epidemic delirious fever of modern intellectualism. The educational methods, the business training, and the social customs are equally failures to cultivate the concentration, the impersonal judgment, the widely sympathetic understanding which would make the modern citizen alive to the mental, the material, and the humanitarian opportunities of today. The mere animal is gratified with the use of its physical senses; but man has in addition to these the gift of mind, and the individual soul which must also be satisfied.

The educational system injures the plastic mind of the child with its confusion of many unrelated subjects; he is gorged with details and his mental dyspepsia is made worse by conditions of his restless, badly-balanced and dominant body. The so-called successful business men are often monstrosities of one-sided development. He who bends all his energies towards sowing and reaping dollars and cents can have no joy of living in the wider fields of human thought and feeling where the individual nature is enriched by the truth in other's lives. The prize winners in such are often miserably lacking in symmetrical human development. The social leaders may enjoy their position so long as they are only alive to the motives of ambition and vanity. But no such cultivated, broad and noble nature is at home in a society which measures values in wealth and position. The soul's impelling desire for the comradeship which even here, has flashes of the original divine unity, will ultimately turn from the misery of the social counterfeit to the joy of the sacred reality.

One of the main sources of misery in the world is found in the old degrading theology which has belittled and beclouded men and robbed them of the joyous belief in their own divinity. For ages man has been taught that he is a miserable sinner who could only be saved by the vicarious sufferings of another. What wonder that thus deprived of the incentive to cultivate on earth his spiritual will and the joy of the soul sense which makes all things easy, he has so long sought satisfaction in gross and in refined materialism. Had the original teaching of Reincarnation been retained in the Christian church it would have shown the logic of a

belief in immortality and the purpose of "working out salvation" here.

When one is worn and weary with the monotony of every-day duties, what refreshment and enjoyment is found in the simple change of an outing. New scenes and new people stimulate the dormant senses and at once seems to step out into a wider and fresher world. The mere change of surroundings has the magical effect of giving one new courage and impetus for resuming the old duties again. If so slight an awakening to fresh externals can do so much, there would be no comparison for the joy of a life in which we daily grew more alive to the power and beauty and liberation of the soul at the center.

**INQUIRER:** What means would you resort to in order to promote such a feeling of Brotherhood among races that are known to be of the most diversified religions, customs, beliefs and modes of thought?

**THEOSOPHIST.** Allow me to add that which you seem unwilling to express. Of course we know that, with the exception of two remnants of races—the Parsis and the Jews—every nation is divided, not merely against all other nations, but even against itself. This is found most prominently among the so-called civilized Christian nations. Hence your wonder, and the reason why our first object appears to you a Utopia. Is it not so?

**INQ.** Well, yes; but what have you to say against it?

**THEO.** Nothing against the fact, but much about the necessity of removing the causes which make Universal Brotherhood a Utopia at present.

**INQ.** What are, in your view, these causes?

**THEO.** First and foremost, the natural selfishness of human nature. This selfishness, instead of being eradicated, is daily strengthened and stimulated into a ferocious and irresistible feeling by the present religious education, which tends not only to encourage, but positively to justify it. People's ideas about right and wrong have been entirely perverted by the literal acceptance of the Jewish Bible. All the unselfishness of the altruistic teachings of Jesus has become merely a theoretical subject for pulpit oratory; while the precepts of practical selfishness taught in the Mosaic Bible, against which Christ so vainly preached, have become ingrained into the innermost life of the Western nations. "An eye for an eye, and a tooth for a tooth," has come to be the first maxim of your law. Now, I state openly and fearlessly that the perversity of this doctrine and of so many others *Theosophy alone* can eradicate.

**INQ.** How?

**THEO.** Simply by demonstrating on logical, philosophical, metaphysical, and even scientific grounds that:—(a) All men have spiritually and physically the same origin, which is the fundamental teaching of Theosophy. (b) As mankind is essentially of one and the same essence, and that essence is one—infinite, uncreate and eternal, whether we call it God or Nature—nothing, therefore, can affect one nation or one man without affecting all other nations and all other men.—H. P. Blavatsky, in *The Key to Theosophy*

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## "Christian Occultism"

WHETHER are responsible for the meaning of Christianity ought to get together and settle what is Christianity and what is not. Otherwise the older representatives may sometimes find themselves in company they do not appreciate. At the recent Pan-Anglican Congress in London there was (according to press reports) a "Christian Science" Section; and indeed it is not easy to see what grounds could have been found for excluding it, in the absence of any particular place for drawing a line among a lot of graduated sects.

Now comes a new prospectus which professes to combine Christianity with "occultism"; doubtless an unimportant concern, but one which has adopted the name "Christian" and can therefore claim inclusion in any universal Christian congress. Otherwise those excluding it may need to draw dividing lines and make difficult distinctions.

The general program seems to be to develop powers which are indifferently described as "psychic," "spiritual," and "Christian"; if any distinction is made between psychic and spiritual, it does not appear on the prospectus. The spiritual powers are to be developed by Christians "sitting" in their own homes.

Students of Theosophy will be familiar with the important distinction drawn between *spiritual*, *mānasic*, *psychic*, *astral*, etc., by ignoring which one is in danger similar to that which would be incurred by a chemist who should get his bottles mixed. If we should burn kerosene and gasoline indifferently, or any mixture of the two, we might escape with our lives, but we should probably lose most else.

In such cases as the above the risk is greater, because we endanger not only the body but the mind; insanity and nervous disease being well-known results of bungling in such matters. If there is one pursuit which, more than another, demands all possible safeguards and precautions, such as can be furnished only by the presence of real Teachers (men of knowledge and genuine merit and fitness), and by stringent tests of devotion, purity and self-restraint on the part of the students—that pursuit is Occultism. The mere entry into its outer court requires an unselfish determination to lay aside all personal motives

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

in favor of a life of duty and service to humanity; and its portals can be entered only by those who are prepared to maintain a far higher standard of purity and self-control than is exacted by any religion or science of today. No one need begin to think about entering on this path until he has at least learned to make a distinction between *spiritual* and *psychic*, and to discriminate between the mere reflection of the senses and wishes, and the pure beneficent ray of spiritual Wisdom-Compassion in the heart.

Things are *not* necessarily holy because they are astral or psychic, any more than an Oriental with a turban is necessarily a holy adept; and people who think so are in a class which sorely needs helping.

What likelihood is there that a miscellaneous group of people will be able even to steer clear of the dangers attendant upon the development of mediumship, such as must of course accrue from sitting in circles and awaiting the arrival of an influx? Which of them is competent to distinguish between an inspiration and an obsession?

It is both the duty and the interest of the Christian Churches to disencumber themselves of such movements by defining clearly their own position. Now is surely the chance for the guardians of spiritual truth to come forward and dispel error by the light which they claim to uphold. But do we not find that these guardians themselves are uncertain of their way and are even in some cases dabbling in psychic healing themselves? Unless one is much mistaken, the people, when they find themselves badly bogged by all these will-o'-the-wisps, as will inevitably happen soon, will turn for light to those who have it, and for help to those who can give it; just as many are in fact now turning to Theosophy.

STUDENT

"MEDITATION is but a name to the bewildered; the word is not understood until it is translated by the hungry spirit."

## The Finer Sense Perceptions

NATURE is a loving mother, yet stern when her suggested ways are disregarded. The roar of modern life is hardly among her higher ways, and those by choice or of necessity involved therein perforce pay heavy penalties. We should appreciate or avoid many things, as for instance plants of various

kinds, by the sense of touch. This finer sense we have lost. The subtle virtues of various natural waters or juices should be felt instinctively by the finer sense of taste. This too we have lost. The charm of the woods and mountains escapes us in one aspect through our inability to catch the faint perfumes pervading the air with a magic all their own. The ever-changing beauties of land, sea and sky are lost to many who fail to see the delicate gradations of color in the lights and shadows.

And the loss of finer perception of the beauties of sound is dwelt upon in the *Albany Review* by a writer who asserts that the blare of huge orchestras and choruses is the correlative phenomenon of loss of fineness and power of discrimination in hearing. For the quality of what is produced does not correspond with the greater volume of tone. She writes: "The deafer we grow the louder becomes our music, and the louder our music the deafer we get."

Would we regain the powers the soul has ready for use in its marvelous seven-keyed instrument, the human body, we should live and think clean pure lives—closer to nature daily, from the sunrise hour.

(The photograph was taken some years ago)

### Words and Origins

THE byways of philology are pleasant traveling, and there is always a fascination in the possibility of some new surprise. It is also a science that may be caught in the act and takes an added interest from the point of view that the future antiquarian will look upon our word-making as we look upon that of our forebears, as a mine of crystallized information by deduction. Even now we use many names denoting the origins of their bearers without the connexion being commonly thought of. Manufactures naturally take the name of the place of origin, and a chain of names carries us far abroad. *Cambric* recalls Cambrai in France; *Holland* conveys its Dutch origin plainly acknowledged; *milliner* is not so obvious, but very clearly reminds us of the time when the fashions were set from Milan in Italy, and a Milaner was the equivalent of the Paris dressmaker of our day. Farther east, Damascus gives us the famous *damask*; Palestine contributes the *gauze* of Gaza, whose gates the redoubtable Samson removed on a historic occasion; Mosul gives us *muslin* (French *mousseline*). India contributes the word *calico*, from the manufacture of this material in Calicut; China gives us the obvious *nankeen*, from Nankin, where much of it is made, and *chinaware* is already a common noun. America is commercially speaking too new a country to have contributed much to our derived language. Spain and its famous leather trade once contributed a word not often heard now. *Cordwain* is the material, and a *cordwainer* is the worker in Cordovan leather, always noted for its excellence. Morocco is sufficiently naturalized to be spelled without a capital letter when it refers to the leather of that country. So the list might be extended without departing from this particular class of manufactured material.

But there are many other derivations too interesting to pass over. Of fruits we still call the miniature grapes of Corinth *currants*. The students of Xenophon will easily recognize the *cherry* in the fruit that came from Kerasos on the Black Sea, while Castana in Thessaly suggests the origin of the *chestnut*; *damson*, like damask, perpetuates the name of its place of origin; Damascus, as does the art of damaskeening. Of miscellaneous words *parchment* is a corruption of the Greek Pergamos; *sardines* from Sardinia; *guineas* coined from the gold of Guinea; *gamboge* from Cambodia or Gambodia; *gypsies* from Egypt; *canaries* from the Canary Islands; *romances* from the Roman style of literature; and a hundred and one other words preserve the history of their origin. Possessing now merely a pedantic interest, perhaps, these derived words may recall a time when words meant far more than they do in our day. Like so many other sciences of the ancient temples, language has much in store for us to learn before we attain the dream of philosophers—the universal tongue, natural, not artificial.

It may be that every word once contained its own peculiar meaning in such a language, open to the eye of any scholar possessing the universal key. There is a hint of this possibility in the Chinese written language of the present day, which can be read by a Japanese just as easily in his language; or in the Arabic numerals and "An'pers And" (&), which are of equal value in all European languages. Indeed, Madame Blavatsky called attention to this many years ago in her wonderful observations on symbolism. It may be, who knows, that there is a science of pure language in the abstract, lost to our modern civilization, among the other lost sacred sciences. Such a language, with infinite possibilities of variation and sound and rhythm and the bases of these, has often been suspected as no mere philo-

sophical chimera. Some musicians may have touched the outer hem of such a language with the magic of their combinations. Who knows?

Bards and poets and painters may hear it dimly, and translate it as best they can into the product of their genius, while we marvel. Architecture is called "frozen music." Perhaps this is an echo of the universal masonry.

And yet there is extant the statement on unimpeachable authority that even in Europe within recent years the knowledge of the power of the uttered sound has been used to bring back from the gates of death one whom the doctors had given but a few hours to live. Not only once, but three separate times was this modern application of the practical knowledge of the ancient mysteries used—by those who had earned the right. It was used in behalf of one who had dared to accept life at their hands with all the attendant consequences—because in the divine economy all must be paid for. But in this case no taint of selfishness or ignorance entered. The awful penalty of suffering was deliberately assumed for the sake of needy brothers without the door—all humanity was calling for aid.

Our study of derivations leads us far into the grammar of the great science—let us add one more. The old English word *cowans* is the same as the Hebrew "cohen" or priests, who were ever opposed to the schools of the prophets. Many have sought the derivation of this old word and its true meaning. It is in such circumstances as the above that we find a glimpse of the opposed forces of the exoteric hierarchies failing—as they ever do—to meet the needs of humanity, and the latter turning from them to the guardians of the temple-wisdom of old for that light of which the cowans have none to give. But this will only be of interest to some students of the various philosophical systems. P.M.

### Fairy Tales

"WHERE there is no vision the people perish," says the Bible; and let us look to it that such a fate may not be before ourselves. Imagination has to do with past and present and future, and is saving health in relation to all three. As far as the present is concerned it is assuredly the salt of life, without which all the food of our brains tends towards corruption. It is the one organ by which we can contact our grander possibilities, as they have been revealed in the forgotten ages; and by no other faculty can the trend of our lives be altered. It is

The sovereign alchemist, that in a trice  
Can life's dull metal into gold transmute.

In childhood we are the center of an orbit as wide as the skies, wherein circle unrevealing suns and planets. Money has no value there, unless it be fairy gold, or fetched from mysterious places, and by marvelous means. What? They are to grow up, and become *sensible*? Rather say we mummies were at one time human, with life and richness in our souls, and undessicated imaginations. That is, we once were children, and had some glimmering of a glory, for the most part lost long since. To what kingdom does that glory belong? Why, to the human kingdom; it was our own and we bartered it for some fool's mess of pottage, as pleasure or greed or ambition; remember that it was our own heritage out of which we were cheated, or which we flung away. Children deal in the marvelous because the marvelous is open to them; that is, untracked regions in the human soul are open to them, and to deprive that side of their nature of its natural food is to send it famine-driven to the garbage piles for sustenance. There is the instinct; you cannot alter that. The soul, so lately arrived from its own kingdom, rejects contemptuously the pseudo-solemn things of this world; money-making and politics and so-called religion it sees precisely in their true light, and turns to the consideration of the glory it is so loath to lay down. "Tell me a story" — *for I am homesick, and must hear some tidings of my father's many mansions.* "Tell me a story" — *or I must go forth myself, a-wandering in quest of adventure, and heaven knows I do not know the way; (he is unarmed too, and how shall he meet perils that may assail him?).*

We are not so foolish now, as a rule, as to forbid our children play or bodily exercise; knowing to some extent what would result from such a gap in their lives, of evil physical and moral. What then of the imagination? Is all use of the spiritual motor nerves to be forsworn, and is the mind to be hamstrung and flabby? Beware lest it find some noxious activity for itself, and secrete poison behind the barred and shuttered windows you seek to close upon it.

All of which we know well enough by this time for the most part, but Pterodactyls are still sometimes seen in Piccadilly, we learn. War has been waged in Passaic, N. J. over the use of fairy-tales in the schools — and fortunately the saurian idea has been defeated. "We do not approve of this class of literature; the children should be employed in some *useful* way instead. Was not the universe built for the purposes of money-getting? God help the man who does not accumulate

money. Look to it that you begin early to carry out the cosmic design." (Why was not man born with as much maturity as the ducklings, so that he might run off to business as they do to their pond?)

How long, how long are we to enshrine utilitarian selfishness? How long shall we set our faces resolutely dollarward? Children, children, you shall have the tale of King Midas graven on your hearts; you shall well understand what path it is that leads a man to grow asses' ears and an ass's understanding. We throw away our real selves; we wall up and go no more by the spacious halls and corridors of being through which we used to pass; the magical and stately gardens we wandered as children, they are all deserted, the wolves and the owls keep them. Can you not see that it is yourself you have permitted to become so pitifully limited?

What thoughts do you have that do not run in the little groove? What greatness or beauty ever comes near to you? You have become dazed by the pounding insistence of material things, and you have grown into keeping time and tune with them, until your own feet now have forgotten all independence and nobler modes of action. Yet were they accustomed to the mountains once, and you might even now be free —

Fairy-tales are thin masks for the story of the soul; and they have persisted since before the pyramids because they meet one of the chief needs of the world. A childhood bereft of this essential food of childhood can never blossom so finely in after-years. The growth of the imagination will always leave much to be desired; there will tend to be a scantness in ideality. Could we keep the spirit of them with us as we go into manhood we should be a race of bards and heroes; we should permit no sordidness nor corruption in our midst.

C. I.

### Eternal Youth

EVER since somebody remarked that in his opinion men ought to be put on the shelf at sixty, others have been writing to prove that many of the greatest successes have been won by men over sixty. And the facts prove this, as can easily be shown by making a collection of such great names and their achievements.

Despite our pessimistic theories of life, the fact of eternal rejuvenescence will persist in asserting itself. There is something undying in us, and its action is impeded, but not prevented, by the weariness of the body and the crystallization of the mind. Nothing could be more obvious, to a mind unencumbered by theories, than that one's life is merely an episode in a continuous drama, death being but the ringing down of the curtain between the two acts. Nothing could be more preposterous than the idea that the life-work of a man with all his aspirations and enthusiasms, which he has only time to begin, should vanish forever all uncompleted at the death of his body. True, they may be taken up and carried on by other men, will be answered. But does even that answer satisfactorily solve the problem? Is the Ego so temporary? Is the Ego a thing that is created at birth, appears for a brief space—then goes off for ever, never to return?

The facts of life would seem to show, on the contrary, that man is conscious of his own

immortality and behaves as though he were. Not only does he act as though he had unlimited opportunity before him, but he enters this life as if he were picking up past threads and renewing old labors.

The personality is so altered by the processes of death and rebirth—and no wonder—that we cannot recognize it again; but perhaps we shall not always be so dull. As a rule we recognize people only by their perishable traits, and know nothing of their real Self; and they themselves are probably little less ignorant about their own real nature. Death may remove most of what we deem essential in a Soul, may purge away most of what the man regards as his real self. But great Nature has other ideas of immortality and of what is worth preserving and what not. The Soul is the real man, and in its interests is the life led; the bundle of notions and habits which we succeed in accumulating about ourselves during one life are not things to be perpetuated, and so a purification and a new beginning takes place.

It is the Soul alone that can preserve a consciousness throughout life and death; and to share that consciousness, we must share the life of the Soul, rise to its plane, shake off our limitations, the greatest of which is a too uxorious fondness for that idol we create in our own image — our precious selves — the reflection of our desires and prejudices. Men doubtless like to create some theory of after-life more in accordance with their undeveloped understandings; but the real facts of life must surely transcend the limits of our present understanding, nor can eternal Law be conditioned by what we consider desirable.

During sleep we lose our identity, but find it again because we have the same body. In a new birth, we have not the same body, and the only thing that is the same is the Soul. Hence, to be conscious of our identity, we must be conscious of the Soul. Most people, then, do not yet know *who they are*. The doctrine of Reincarnation implies a consideration of the past as well as the future. *Who am I?* If we could answer this, the mystery of life and death might be no more.

### Were the Egyptians Idol-Worshippers?

(CONCLUDED FROM PAGE 5)

most profound type partly concealed under the mask of carefully devised glyph and symbol; and a morality so high that the nation escaped the rapid decline and fall of Greece, Rome, and many other civilizations, and had flourished previously in honor and dignity for unknown milleniums. To what else can this marvelous phenomenon in the world's history owe its vitality but to the profound spiritual knowledge possessed and applied by its leaders, and the high ideals held up to the people?

The following impressive words of H. P. Blavatsky admirably express the spirit of the Egyptian religion in relation to the Divine order of the universe:

"Occult philosophy as a whole is based absolutely on the ubiquitous presence of God, the Absolute Deity; and if It itself is not speculated upon, as being too sacred and yet incomprehensible as a Unit to the finite intellect, yet the entire philosophy is based upon Its divine Powers as being the source of all that breathes and lives and has existence. In every ancient religion the One was demonstrated by the many.

"O, God Ani (the Spiritual Sun), thou resident in the agglomeration of the divine personages."

ROMANCES IN THE RED BOOK OF HERGEST  
THE ARTHURIAN CYCLE

THE second category of the Red Book stories includes the Arthurian romances, and before considering them in detail it will be well to glance at the central figure of them, and throw what light may be thrown from Welsh sources on the whole Arthurian legend and its origin.

According to the Welsh account, the population of old Britain consisted of three races that came into the island at different times by peaceful immigration. The first of these were the Cymry, who came from a country called the Gwlad yr Haf, which was destroyed for its sins. They sailed up the Severn Sea in the west, and made their first settlements on the south and north sides of it, calling the one side Cymru or Wales after themselves, and the other Gwlad yr Haf or the Summer Country (in English, Somerset), after the land they came from. The second and the third immigrations were from across Europe, by the Brythoniaid and the Lloegrwys.

Now the leader of the Cymry was the god Hu Gadarn, and he prepared the land for their coming by ploughing it from end to end with the two oxen, Nynnio and Peibio, whom ages before the gods had changed into oxen for their sins. They had been kings in the same island before; the one of what is now called England, the other of Scotland. By their pride and arrogance they had brought fighting into the island, where it had never been before; to stay them Rhita Gawr came down from Wales and conquered them both, imposing peace on their countries. But Rhita in turn became affected with pride, conquering kings after kings of other realms. At last he brought about his own downfall by challenging—the Emperor Arthur. Thus, we must suppose was Britain added to Arthur's dominion, in days primeval, Atlantean, on the horizon of tradition.

According to this story, it will be seen that Arthur stands as the final solver of the confusion in Britain: in after ages Hu Gadarn held the same position, since he tamed Nynnio and Peibio of Scotland and England, and ploughed the land with them, and slew the Afanc of the Lake of Floods, which for Rhita's pride had brought the oppression of waters upon a long uninhabited Wales. Hu, it is believed, was thought to be the reincarnation of the first Arthur; and the second Arthur, of the Fifth century in the Christian era, the reincarnation of Hu, around whom gathered many of the archaic and titan traditions belonging to the first. There is a story in Brittany, of how the first Christian missionaries came to Arthur's court. He received them, as he did everyone, with infinite courtesy, and

heard them until they said that God was in heaven, and far away from the earth and men. Then he perceived that they had no good message, for was not the great God incarnate within himself? In days when the power of the human spirit was felt, and the awful impersonality of those who were aware of their union with It, no least flicker of the strange would have been seen in a story such as this; it is only now that we are perverted with our miserable personal conceit and arrogance that it may appear so. Arthur wondered that they had never heard that he was Hu Gadarn, the greatest of the great and smallest of the small.

The story of Culhwch and Olwen stands first among the Arthurian legends; it is nearest to the fountain source, and contains most of the primal purity and wonder. As Sidney Lanier says, Welsh conceptions and feeling as expressed in it are more remote from the mod-

of Tennyson or Malory, or of the later Welsh stories, with the original Cai of Culhwch and Olwen. The latter was the strongest and most fiery of all Arthur's men. The Emperor never addressed him but as "Blessed Cai"; when it pleased him he could make himself as tall as the tallest tree in the forest; a wound from his sword no physician could ever heal. Only of Arthur's own sword Caladfwlch was the like spoken. Cai stood for some invincibility in the human soul, he was nearest of all to the heart of Arthur. He became degraded as the later story-tellers, wishing to exalt their own particular heroes, made them perform the final feat of defeating him.

So too, the character of Modred is inconceivable, as given by the Normans, to the old bards, who were generous at least in painting their good men or their bad. Their Medrawd was bad, but with the badness of a Lancelot; it was never said of him that he was afraid, or less eager for battle than the bravest. Gwalchmai, again, was a magician with his tongue; he could make all difficulties vanish by the sweetness and power of his words. Gawain, his Normanized representant, was a mere utterer of hollow words—and so on.

ern, more remote from the English, than anything that can be found, even say in the writings of the Chinese. Fastidious and delicate critics will speak of it as uncouth in its details, and lacking in restraint; we have no useful canons for judging that which is essentially bigger than ourselves. It is as archaic as the mountains, as pagan as the north wind, and indicates what the noble source must have been from whose debasement all the familiar Arthurian stories have sprung.

This debasement was the work of Norman minstrels, who heard the old tales from the Welsh bards, and had no Theosophic clue with which to unravel them. So they retold them in their own manner and also invented new ones, making of all the characters conventional and mediocre Normans whom they could thoroughly well understand, instead of the old archetypal figures representative of the powers of spiritual light and darkness. One turns from the vast, the lofty, the impersonal in search of a greater interest; and sojourns for a while in what appears to be greater verisimilitude of life, but is, in the event, merely the shallow, the jejune, the worthless. Contrast the Normanized Sir Kay the Seneschal,

we call a "musical atmosphere," but the actual audible musical sounds themselves. From six o'clock in the morning until nine at night may be heard in some quarter, and usually in many quarters, the sounds of violin, viola, cello; of flute, oboe or bassoon; of trumpet, cornet or French horn; but chiefly of piano, violin and the human voice—audible records of careful sympathetic practice. The dead stillness that meets one's ears outside in respect of such sounds, tentatively, boldly, sweetly, painstakingly, or perhaps timidly, floating across to you through the Lomaland clear, still air, is at first depressing, contrasted as it is with the vibrant, ringing air of this city set apart for life's higher uses.

When Katherine Tingley inaugurated in Point Loma the many departments now being carried onward to fruition she gave to music a principal place. Music-teaching was at once begun and music found a prominent place in all the social life of the Hill. Particularly were the tiny tots "started" and very soon their musical work became one of the attractions of Lomaland. Today music is of the air we breathe, inspiring, calming, sustaining, lifting the soul daily to greater heights. H.

Many in the world are trying to define the Law, but they have not the key which Theosophy gives.—*Katherine Tingley*

### The Ocean of Life

IT is said that the late Swedish poet and thinker, Viktor Rydberg, would make it a point occasionally to use chairs which stood in some remote corner of the rooms, where they were not used very often, in order that they might feel themselves "at home" and not useless. In this act of a singularly intuitive and intelligent man lies the spirit of the old days, when knowledge still prevailed in the North—a time which, indeed, is not so far distant. Then, even the common people had a conception of the ocean of life in which they lived; of the higher life which they held sacred as the inner court of the Temple into which they were entering with the glow of the spiritual sun upon them; of the lower life intrusted to their care in all the details of everyday duties.

That this spirit is still alive among the Northern people is shown in the care they often take of the things belonging to their households. They feel it a crime not to utilize everything to the utmost and in the best way. To spoil or discard anything before it has served as far as possible is felt by them as a throwing away of a center of life, a something which by thoughtful and careful handling would receive a touch of our higher life, just as we do of the still higher life above us.

The heart of a child of the North leaps with enthusiasm to read of this conception of his forefathers in the old Sagas. We can then better understand the true spirit of chivalry, the nobleness of conduct, the fearlessness and the ease with which they undertook the greatest deeds. They thought of themselves as living in this ocean of life, with nothing to fear but the degrading of the divine spark that urged them onward. Death? No, they were wiser than we in this respect. Death was considered as a time of rest in the abode of the gods, as Odin's guests in Valhall, until earth's work should be taken up again. Fear of death was unknown—even in cases of

cruel death inflicted by irreconcilable enemies we find the spirit of eternal life so strong that it lifted the consciousness of the hero far above the agonies of the body, far above the pain suffered by an earthbound soul.

Everything in the world has life, said the old Norse, even the stone at one's feet, and the wide waters, ploughed by the ships. Everything, said they, has an inner form, invisible, but exactly corresponding to the visible, material form, this invisible body being the

YET for a space they abide with us,  
Yet for a little they stand,  
Bearing the heat of the day.  
When their presence is taken away,  
We shall wonder and worship and say,  
"Was not a star at our side with us?  
Was not a God at our hand?"

Fear not for any man's terrors;  
Wait not for any man's word;  
Patiently, each in his place,  
Gird up your loins to the race;  
Following the print of her pace,  
Purged of desires and of errors,  
March to the tune ye have heard.  
—SWINBURNE—from *The Hail Before Rome*

real vehicle of life, clothing itself with earth-matter. They held that because of this more subtle, plastic form man's way of handling things has far-reaching results; for this subtle matter is not influenced by hands nor tools, but by the states of mind, by thoughts and aspirations. They held that by always keeping the mind controlled while fulfilling his duties, man becomes like a Sun unto everything around him, spreading warmth, joy, and happiness in all directions.

They said, for instance, that sculptured or carved things had much in common with their maker; that their inner invisible form became linked with his because through the inspiration with which he worked he gave them a

touch of something divine. Thus we can see why, in the North, the beautifully-carved house furniture passes from generation to generation as something sacred, partly because it is bearer of the maker's thought-life, and partly because through use it is felt to have acquired something of the family spirit. So even with articles of iron, bronze, silver, gold and enamel-work—we are told by scientists that three thousand years ago the Northerners' skill in these arts was unequaled. How often do we not read in the Sagas about swords which possessed some special quality because of the careful and knowing way in which they were forged, or about gems and jewels of special and lasting value to the virtuous owner, although sometimes they caused the death of an unworthy owner. Shall we laugh at this as "superstition"—or confess our ignorance concerning the "ocean of life," the greater life, in which we live?

In the old days it was customary at death to place the more precious belongings, those especially dear to the dead during life, in the grave or on the funeral pile; not that the people believed in the possibility of carrying these material things with them to Valhall, but because of the reverence felt for their inner forms, that part which by the love and care of the maker and owner had been lifted to a higher level. It was the life in the invisible, imperishable bodies of these beloved belongings that followed man's immortal part when the latter left its prison of earth-matter for a period of rest.

Another beautiful evidence of this belief is the honor in which was held the tree at the entrance of the home; for such a tree had seen many generations of the same family and was regarded as intimately connected with it. When a child was born the rustle of its leaves sent its mystic welcome, and when a member of the family returned from a long journey the tree greeted him with a whispered welcome which he recognized and felt

in his inmost soul. The birds never sang so joyfully, so enthusiastically, as in this tree. When it grew too old to live any longer the whole family gathered together, a shoot was taken from the old tree and planted by the old grandfather, with solemn ceremonies, this to carry on and into the future the traditions of the parent tree. And when the mighty trunk had fallen, the wood was used only for the most honored purposes, as for instance for the making of shields to protect the warriors of the family, and for beautifully carved chairs and tables.

Such was man's attitude towards the lower life a thousand years ago or more in the North. What can be said of his attitude in the other direction, how did the people in these ancient days stand in regard to the higher life?

We cannot find any trace of fear; the attitude is always the same, though here receiving instead of giving. The old Norse thought that Helpers of mankind always gave the assistance and help needed at the moment—it was man's to receive it or refuse. Thus man lived to open his soul unto the light, and knew that by constantly doing so he could reach the heights where the gods lived. Nor did they so much consider the outer life of man—his "respectability" as we now would say. Their conception of life was too clear for that. Each low thought stained the inner invisible body of man and became an obstacle in his way. Man thus had to build up his inner form by pure thoughts and noble acts, that it might be able to survive after death and consciously bear the soul from earth to rest in the abodes of the gods. That this was possible they knew well—for not only did the gods pass constantly from the one realm to the other, but even their greatest heroes had been able to go to Valhall with full consciousness and return to earth when needed.

Shall this conception of the mystic ocean of life, this remnant of the ancient, sacred Wisdom Religion, which is the heritage of the sons and daughters of the North and still must be found in their very blood—shall it be neglected and left to fade away? Shall it not, rather, be brought up to the surface again, linked with the pearls of wisdom which the cycles once more are offering to men to lead them to that nobler life which is their real heritage? That, once realized, will reveal the glorious duty lying before them: to prove by the very way in which they live their lives that the ocean of life is a reality.

To Lomaland Students the "ocean of life" is indeed a reality, even to the tiniest tots, who know it not by any spoken name but as that something which makes it so dreadful a fault needlessly to soil or break a plaything, wantonly to put clothes, rooms, or belongings into disorder, to deface books or music, to do anything, in short, but treat with the most tender and loving care all that is entrusted to them, from singing bird to little half-worn apron or coat. A SWEDISH STUDENT IN LOMALAND

### The Loma That Is to Be

I saw you passing on your ways, and as you passed some glory shone,  
That lit up all the endless days your deeds shall breathe their splendour on.

THERE is a beauty spot in the world whose beauty will be actually a positive quality, shedding light far and near. The foundations are laid now; nothing, perhaps, more than the foundations; but they themselves are of such marvelous architecture that all hearts are drawn to Lomaland whose eyes have seen it.

Oh, the possibilities, the possibilities of those fragrant acres! One need not be without splendid dreams and visions at every moment of the day; indeed visions and dreams start up from the soil and crowd upon one, and the

mysteries and memories of the Golden Age.

Out in the world, we are always driven to seek in dreamland for some means of escape from the accretions of dreariness and strain that grow up around us. So we read romances, go to the theater, play games; and pursue, in whatever ways we may, mournful and momentary enjoyments. Here one passes from one duty to another, and along the road all entertainments and richness will be set before one. I mean, with these conclusions that one cannot escape from, concerning the jewel-rich and luminous portent of the place and all things incident to it. As Greece or Palestine might be with the past, so is this place pregnant and aglow with the future.

The truth is, the world is beset with foul thought; a quagmire of demoniacal thinking is all round and about it, and impinging upon and enslaving unguarded minds. For this reason, men are heedless of the million-bloomed beauty and grandeur that will spring up in a night where a mind and heart can be kept in quietness for its fructification. But here, the scarlet fruitage hangs over deep, still, reflecting waters. There is none of that pressure and turmoil of mind that keep men from ever more than glancing at life for a moment as it passes. In the world, we are too much hurried and driven by thought and circumstance to live; in Lomaland life takes care of itself, if we do our duty by it, and soaks into twenty-four of the hours of each day.

Yet the peace is not bovine but spiritual, magical. It is pleroma; not emptiness. We seek here and there for some means of revealing the glory, which, day and night, thunders along the shores of our vision; but we find no means, save in speaking of common facts, which to the pious are stumbling-blocks and to the wise folly. Such common facts may be insignificant enough in their way, but legions of angels may lie ambushed behind them, and in the performance of some trifling duty may hang, for aught we know, the whole destiny of the world. KATHERINE TINGLEY AND SWEDISH AND AMERICAN THEOSOPHISTS  
Off for a Day's Jaunt (1907) on Visingsö, Sweden

In a country cart of old style Katherine Tingley and her party made several trips in 1907 about beautiful and interesting Visingsö. One of the Visingsö country folk, who as shown in a former article have for generations lived their simple life upon the mystic island, always feeling themselves to be the guardians of it, was the driver, and in the illustration is seen standing at the horse's head. The Leader may be easily recognized; the ladies at her right (left, as they face us in the picture) are the Hon. Nan Ino Herbert and Mrs. Walter T. Hanson. Next to Mrs. Hanson is Miss Margaret, the little Rāja Yoga representative who accompanied the party to Europe. Behind the ladies are Swedish, English and American Students and Representatives. For a full account of the trip to Visingsö, the reader is referred to previous issues of the CENTURY PATH.

golden future will not let one be for its calling and glorious importunity. What are a few little years, to that which has been set up for all eternity; or a life or two to wait, for those who have yoked themselves forever to this vast chariot of the world?

When we see the rosebud on its stalk, we guess the wild beauty of the rose to be; the silk of perfection, the cream and satin and saffron of delicacy, the crimson, glorious, untraversable depths. You now, oh, white Lomaland, are the glittering rosebud of the world; no one can tell what glories are hidden within you. All the human beings that I see appear to me to be the chrysalides from which winged gods shall come. I cannot tell what there may be about the trees and flowers, to make them seem to me not voiceless nor unintelligible, but articulate if they would be, expectant, and clearly conversant with the

### Jottings and Doings

(From a Student's Note Book)

A DESPATCH from Paris states that all of the first prizes, bestowed in the various departments of the Paris *Conservatoire*, were this year bestowed upon young women. This indeed indicates a swift turning of the tide, auguring a still greater musical future.

A YOUNG New York sculptress is now doing some remarkable work in depicting East Side life—the old ragman of the slums, the peddler, the lonely young Italian wife, the omnipresent and pathetic child-type, etc. The former work of this artist includes "Mowgli," in the collection of American bronzes purchased by the Metropolitan Museum. Some of the most remarkable of our modern plastic pieces are the work of young women. Particularly is this true of American sculptures.

A GLIMPSE OF THE BOYS' HOMES, RÂJA YOGA ACADEMY, LOMALAND

## At Home With the Râja Yoga Boys

**T**HIS glimpse of the boys' homes at the Râja Yoga Academy at Point Loma suggests many pleasant sights and sounds to anyone who has been in Lomaland and seen something of the life of the boys there. In each of these bungalows live a group of boys and a teacher. Each house has its garden, its piazza, its pleasant sitting room, and its dormitory.

Boys of every age are to be seen here—little ones just out of the nursery playing with rocking-horses in the shade of the palm trees, bigger ones playing marbles, gardening, or reading, and tall youths studying or exercising in the open air—perhaps tending the rose-bushes that climb over every bungalow. The sound of boyish laughter and merry play mingles with that of different musical instruments; the place is full of stir and life except when the long orderly lines have formed and marched over to the dome-crowned building where classes are held. This building is in itself enough to inspire a boy to do his best, for it is a thing of beauty, with its pillars and colored windows and flower-decked tables arranged every morning by a gracious hand.

Here the boys have their recitations covering all the regular school studies and marked

**T**HE truest and fairest thing of all, as regards education, is to attract the mind of the pupil to the fact that the immortal self is ever seeking to bring the whole being into a state of perfection. The real secret of the Râja Yoga system is rather to evolve the child's character than to overtax the child's mind; it is to bring *out*, rather than to bring *to*, the faculties of the child. The grander part is from within.

—Katherine Tingley

throughout by the true scholarly behavior and deep concentration that Râja Yoga develops. Here may be seen the result of beginning *on right lines*; for now the right way to study and to learn is communicated by one boy to another as if by a sort of magic; and boys who found it hard to learn before they came here, and boys who never tried before to do anything in the right way, feel the force of noble example and soon themselves become examples to new boys entering the school.

It is a glorious thing to study day by day always with a high ideal in mind. The old ideal of knighthood did much for the youth long ago, and the virtues that were part of it are as badly needed today as ever; but more is known today about humanity and humanity's needs, and more is required from those who wish to serve nobly. The Brotherhood

ideal taught by Theosophy and exemplified in the lives of H. P. Blavatsky, Wm. Q. Judge and Katherine Tingley has the quickening power to stir in boyish hearts the effort needed for self-conquest. And when a boy undertakes self-conquest, and begins to win victories for his warrior-self, what wonderful results come!

These results are seen in the Râja Yoga boys' lives. Not exhausted by selfish desires, they have a store of energy and vitality which, when directed, as here, *on right lines*, enables them to progress rapidly. When a boy learns to take command of his lower nature properly, his bearing changes, his mind clears, he can learn much more than before, in a short time, and he knows how to make all he learns helpful to himself and others. His success arouses great enthusiasm among the other boys; no mere prize-winning can stir up such a feeling. The whole life of a boy who lives by Râja Yoga blossoms out into helpfulness to his fellows. He finds that he can do things he never tried to do before, and that everything seems to have been waiting for his effort at self-conquest. The comradeship felt by a body of boys thus awakened is what makes the sunshiny atmosphere of all these boys' homes in Lomaland. STUDENT

# THE CHILDREN'S HOUR

## THE CRICKET

**L**ITTLE inmate, full of mirth,  
Chirping on my humble hearth;  
Where'so'er be thine abode,  
Always harbinger of good,  
Pay me for thy warm retreat  
With a song most soft and sweet;  
In return thou shalt receive  
Such a song as I can give.

Though in voice and shape they be  
Form'd as if akin to thee,  
Thou surpassesst, happier far,  
Happiest grasshoppers that are;  
Theirs is but a summer-song,  
Thine endures the winter long,  
Unimpaired, and shrill, and clear,  
Melody throughout the year.

Neither night nor dawn of day  
Puts a period to thy lay:  
Then, insect! let thy simple song  
Cheer the winter evening long;  
While, secure from every storm,  
In my cottage stout and warm,  
Thou shalt my merry minstrel be,  
And I'll delight to shelter thee.—*Selected*

## Heroes of the Future

**M**ANY little boys and girls wish that there still were dragons, giants, and such dangerous beings as there were in the old times which stories tell about, so that they might have a chance to become heroes and do brave deeds. Well, children, be ready! There is still an opportunity for you to be heroes.

Where do you think all these monsters went? You know very well that *something* cannot disappear and be *nothing*. There is some water in a dish and the sun is shining on it. After a while you see that the water has disappeared. A very ignorant child might think that the water exists no more, but you know that it is only transformed into vapor and made invisible to us.

Where did these terrible monsters go? You know from the stories that they could transform themselves into all kinds of shapes. They took advantage of that cunning power of theirs to fool the people into believing them all gone, so that their brave heroes would think there was no need to be on guard. Alas! Alas, for the people!

Now at last the time has come for the evil things to be found out. Watch and be ready!

But where did these ugly things go? Where are they now?

Once upon a time there lived a frightful dragon on an island in the sea. He had nine heads, each one uglier and more malicious-looking than the others.

Every third year he claimed as an offering the most beautiful princess in seven kingdoms; otherwise he threatened to destroy the whole people; and many had been his victims.

This time the princess who had been selected as an offering to the dragon was very much beloved by all the people, not only for her beauty and grace, but still more for her

kind generous heart, her readiness to forget herself for the welfare of the people, and her great wisdom.

In a far away country was a king's son. He had done mankind so many great services by killing monsters that a powerful fairy had given him a magic sword, which had once belonged to the gods. It was sure death to any one whom it wounded. He had made a vow to save the princess or die in the attempt.

The dragon knew that it would be his last day when he took this princess, and he pondered in his evil mind how to deceive the prince and revenge himself on the people, whom he hated. After a long time he had the plan ready; so clever was it, that the dragon rolled himself around and around in glee, laughing with all the nine heads one of the most spiteful laughs that ever had been heard in the world.

Then he began his treacherous doings. He hid the dragon-skin under a mountain, put his heart inside a black toad, which he sent to live in the slime under the bottom of the deepest lake. After that he transformed himself into a little cloud of dust, so fine that it could not be seen, except as a faint smoke.

In this shape he reached the palace where the princess lived. Nothing hindered him from getting in; he even passed close by the prince with the magic sword. When he came to the princess he went right into her body, and settled himself in her very heart. She did not notice anything, except a cold shiver and a sharp pain which soon passed. Presently she went, as was her custom, out into the garden to see the children. They had always been her friends; even the tiny babies reached their hands to her and smiled, that she might take them in her arms. The children used to come into the garden, where they waited and watched for her. Then she sometimes played "hide and seek" among the trees and grottoes, or gave them fruit and flowers to take to their homes.

Today one of the children seeing her come gave a shout of joy, and ran with outstretched arms to meet her, but suddenly he stopped and drew back as if he had met a dragon instead of his friend, the princess. This was really true, though neither the child nor the princess could see it with their outer eyes. When she saw the child turning away, it was not her own musical voice that called, "Stay, I command! or I will see that you are punished." But the child ran away crying bitterly and could not be consoled. "I am afraid of the princess!" was all he could answer to the questions put to him.

"Afraid of the princess?" The mother thought that the child must have caught a fever, and anxiously put him to bed, but he still moaned and cried. "Afraid of the princess? O, my child! could anyone ever be afraid of the blessed princess, the angel of our lives? What should we be without her? Our sons strive by chivalry and manly deeds to be worthy of a place in her army, and our

daughters in womanly purity to be like her. O, my child! It cannot be."

But the change which had taken place in the princess was soon seen by all. The dragon, who hated the people, found a thousand ways to make their lives unhappy, and everyone believed it to be the doing of the princess. The worst of it all was that like a contagious disease, it spread to all who came in contact with her, and from them to others. Soon the people in the whole kingdom had dragon-dust in their hearts.

Sometimes when the dragon was asleep, the real princess could look out through her eyes, but she could not speak, as the dragon had sealed her lips so that they could not be used except by himself. Thus the prince, who was protected by his magic sword, saw her once, and he never forgot that look of unspeakable sadness, which seemed to beg him to set her free.

True to his vow, and haunted by the imploring eyes of the princess, he set out to seek the dragon to destroy him, but he was nowhere to be found. At last the prince sought the fairy who had given him the magic sword. She advised him to travel until he found a certain good magician, who had more power than the mightiest of the evil ones, and ask his help.

After many wanderings through darkness and danger, searching every corner of the whole world, at last he found the magician.

"I have been waiting for you," the Wise One said. "Now you may see for yourself." With this he gave the prince a magic mirror, in which he saw the princess, the transformation of the dragon, and his own long wanderings.

"There is only one way to save the princess," the magician said. "You must first remove every particle of the dragon from all the hearts to which it has spread; but be sure that for every atom of dragon-dust you remove, you place one of these little magic seeds which I give you. When all this is done the dragon will be so weakened that you can force him to tell where his heart is hidden. This you must find and destroy. Then the princess is saved."

The prince went back and commenced his great task.

Most stories that you have read have an end, but this story cannot be ended, because the prince has not yet completed his task; the princess is not yet saved; the dragon is still enjoying his success and tormenting the people. He and his kindred have spread over the whole earth. Do you know his name?

The prince needs helpers. Those who are brave enough to make themselves free from the dragon in their own hearts, will be given the magic seed to place instead of the dragon-dust they remove from the hearts of others.

Children! There are heroic deeds for you to do. The prince is hoping for your help; the princess is sighing for freedom; will you be brave and undertake the task? SKULD

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogenesis  
Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

### Latest Science: The Universe as Negative and Positive Electricity

THE atom used to be regarded as an ideal unit, convenient as a basis of reasoning, but not necessarily having any actual thing corresponding to it. As such it was variable, according to the respective requirements of those postulating it. Thus the chemical atom was not the same as the physical.

More recently we have come to regard the atom as a definite existence and to study its properties more by the light of direct observation. We have found it to be indeed a unit, but a unit whose fixity is only relative, like a mile which serves as a geographical unit but can be divided into feet and inches. And we are now studying some of those subdivisions of the atom.

The ether was postulated to act as a medium of communication between the atoms and between large bodies of matter. The atoms were regarded by some as floating in this ether, by others they were regarded as gyratory motions or as strains in the ether. But now the ether is postulated to fulfil a similar function with regard to the smaller rudiments into which we have analysed the atom. The same old controversy as to the structure of the ether subsists. It must be "continuous" if we are to avoid a mere repetition of the original difficulty such as would be involved in considering it as atomic. Yet it is impossible to understand a continuous medium, seeing that we are accustomed to explain all the properties of fluids on the hypothesis of their structure being atomic.

Lecturing on these questions, an English scientist recently said, as reported, that we may form some notion of the minuteness of the atom as follows: sea-water has about 1/50th grain per ton of chloride of gold, or one part in a thousand million; yet in every cubic millimeter of sea-water there are over a thousand million atoms. But again, the atom is huge as compared with the electron.

And if it be true, in any sense, that an atom is mainly composed of electrons, they must be as far apart from each other inside the atom, in proportion to their size, as the planets of the solar system are in proportion to their size. . . . Though an atom may perhaps contain thousands altogether, it consists mainly of intervening spaces in which there is nothing but continuous unmodified ether.

Clearly size is of no account in the universe, and merely indicates the limitation of the faculties of particular beings. A universe of

stars may be one atom; an atom of electrons may be one universe. Somewhere in the middle of this chain stand we; on one side of us lies what we call the infinitely great; on the other the infinitely small. Are this greatness and smallness absolute or merely relative to our faculties? Is the chain a circle, the infinitely little swallowing the infinitely great, as the symbolic serpent swallows his tail; and all, to the untrammelled vision of the seer, neither small nor great but an eternal unity of complexity?

The scientist quoted makes his ether extremely massive and dense, because it has to be denser than the aggregate of scattered particles which, floating in it at such relatively

vast distances apart, constitute matter. For is not matter a mere gauzy cloud of scattered specks, like smoke?

Does it not comprise almost infinitely more *no-thing* than *some-thing*, being in fact made up chiefly of holes and spaces? But the ether, supposed to be continuous and to have no such holes, must be very dense and massive. This is quite a different idea from that which regarded the ether as something extremely tenuous. Here we have the ether figuring as the *densest, most massive thing in the universe*, and from one viewpoint this is also Theosophical teaching.

Quite in line with this, too, is the idea that the atom is a center of the most *colossal latent energy*. The forces liberated from it in chemical reactions are the merest superficial cream compared to the enormous energy that would be liberated by decomposing the atom—which is indeed supposed to be the source of the wonderful energy of radium. This idea will be familiar enough to students of Theosophy, who will remember John Worrell Keely, of "Motor" fame, and what H. P. Blavatsky says about him. He claimed to be able to decompose the

atom and thus to liberate an enormous energy by which he could disintegrate quartz

rocks and apply to machinery tremendous power without generating any mechanical pressure. He effected this by the power of sound. H. P. Blavatsky pointed out that his discoveries, undoubtedly genuine at bottom (as were also to some extent his theories), were too dangerous for the human race in its present state of morality, and that Keely would never be able to make them known. This proved true. He could not convince the public—and that chiefly because he found that the successful working of his machines depended upon his own presence and personal manipulation; in other words, the primal source of the effects

was J. W. Keely himself, whose peculiar organism constituted a unique human make-up that was indispensable. This about the latent energy of the atoms, then, is now admitted by scientists; though of course the same barrier to a practical application still exists as before.

**Vitality  
the Greatest  
Known Force**

If Professor — knew of it, would he blab out the secret in a lecture room, or would he not? And if he did, what would prevent the burglars, anarchists, and military departments from getting hold of it?

Again, one must insist upon the point that in this latest view, matter is regarded as made up of elements that are *more* powerful, *more* endowed, than itself. This view is directly opposite to that which regards elements as simple. Matter is not built up into complexity out of simple rudiments, as we used to be taught; it is only a feeble derivative of something much completer and more potential than itself. What was the old idea? A stone was an inert mass of matter; then life got infused into it and it became a lichen, a plant, an animal. What is a stone *now*? It is a sleeping volcano of such enormous power that the evolving into plants, animals, etc., seems a mere light diversion in comparison with what it might do if it tried. In analysing matter,

**Science Must  
"Realize" her  
"Abstractions"**

we have not reached simplicity; instead of finding next to nothing, we have found practically everything.

Our scientist also said that one of the salient discoveries of the last century is that chemical affinity and electrical attraction are one and the same, and that the chemical combination of atoms and molecules is due to the attraction of electric points. This changes our idea of electricity from being an appanage of matter to being that very matter itself; and even the property of inertia may be considered as due to a negative, or to a balanced, condition of the electric forces. We have to fall back upon the idea of particles or centers or units of electricity, called electrons. The lecturer suggested as the three hypostases in the new science: electric charge, magnetic field, and mechanical motion; or electric force, magnetic force, and mechanical force.

The words *force* and *matter* are becoming so vague in their meanings that they are almost interchangeable. They stand for one and the same thing, as viewed in different aspects. The passive resist-

**One Life  
and Its  
Aspects**

ing manifestations we call *matter*; the active dynamic ones we call *force*. It seems fashionable nowadays to call

them negative and positive electricity, though these two terms are perhaps transposed, as the negative electricity seems to be the chief actor.

So we have—the One Life and its two aspects, as *per The Secret Doctrine* and ancient philosophy. The material universe, for the very latest science, is *electricity*, negative (? positive) and positive (? negative).

But those manifestations of the One Life which are objective to our physical senses constitute the very crust of the universe. Prior to them are the forces and qualities of interior Nature, the electricity of Will, the matter of Mind, the space which is Silence. H. T. E.

**Ancient Veneration for Trees**

THE more we moderns develop our own knowledge, the better do we become able to understand the records of ancient knowledge, which earlier we have perhaps regarded as "superstition," because we did not understand it. Later, however, we learn that the superstition was only in our own minds. But there are still many ancient beliefs which in spite of their universal diffusion, even among the most cultured peoples, we still often regard as superstition; though the wiser among us of course recognize that such beliefs, in order to be so consistent and wide-spread, must have had a solid basis.

A writer in a newspaper gives a great array of instances of ancient beliefs about trees, forests and groves, for which a reverence has always been manifested. The word "templum," according to Grimm, also means wood; and woods were regarded as temples more fitting the Divine Presence than those made with human hands. The planting of a grove became itself a religious act, and we find many instances of this in the Hebrew Bible, although the prophets ordered the destruction of groves as being favorable to the cults which they were anxious to supplant.

The use of the tree as a symbol is seen in the ash-tree Yggdrasil of Scandinavian symbology, which ramifies through all creation and nourishes all; and in the Tree of Knowledge and the Tree of Life in *Genesis*. To this might have been added the fact that all through America trees were considered as emblems of life and evolution, and everywhere on this continent we find traces of the World-Tree as in Scandinavia.

The Greek mythology is full of nature-myths concerning Dryads, etc; and trees formed an essential part of the worship of the Druids. The belief in the existence of wood-spirits of various grades and qualities has always been prevalent.

It does indeed seem strange, not that the ancients should have held such ideas as they did, but that we should hold the ideas we do, since we are worshipers of size and strength. A tree is so much larger than a man and out-lives generations, or even nations. The mystery of its growth is certainly not less than in the case of man. All methods of reasoning would seem to lead to the conclusion that *that presence* of which the visible tree is a manifestation must be very potent and significant. Whatever may be that power whose intelligence and activity we see manifested in the giant growth that endures throughout the centuries, it is surely a very wonderful power and one worthy to be revered. Such reverence will, among the ignorant (whether believing or sceptical), degenerate into superstition; just as ignorant peasants or tribesmen have had superstitions and strange rites, and modern ignorant critics have put their own superstitious gloss on the ancient mythologies. But no imitation without an original; and it is possible to conceive a cultured and rational veneration for Nature, entertained by those who understood more about her than we do.

Our science explains the phenomena of Nature very well up to a certain point, and there leaves us. It traces the tree back to its seed, and within the seed it may perhaps trace the cell with its nucleus and nucleole. It is

a science of effects and processes only; *of the causes it can tell us nothing*. To fill this gap it gives us mere empty names; and theology steps in with its single omnipotent creator. But ancient science realized that all actions must proceed from will and intelligence, and that any attempt to supply the place of these two primal causes by anything else amounts merely to *postulating them over again under fresh names*. Hence ancient science recognized that the tree must be, first and foremost, a conscious living being, and secondarily, only, a system of branches, leaves, cells, etc. It is not necessary to suppose that because the tree has not the same kind of consciousness and life as a man or horse, therefore it can have none at all. There are many grades of intelligence within our own organism that lie outside the normal sphere of our attention and therefore appear unconscious, or "automatic" as the saying is.

Wherever there is a tree, there is certainly a great Nature-spirit at work; and how much more so in a forest? This the ancients must have recognized, and hence their communing with the god of Nature in the groves.

But the worship of Pan, the worship of Nature in its lower aspects, is not the highest form of worship. There is also an interior Nature, of which Man himself is a manifestation. Pantheism in its narrower sense means worship of terrestrial Nature, but in its broader sense it means a recognition of the omnipresence of the Divine Nature which underlies the terrestrial Nature. Though the trees are ensouled, we need not assume that they have immortal Souls like Man; we should not become tree worshipers. Yet even so, the pure and undefiled spots in Nature are fitting places for Self-communion, because they are at least free from perversity of will and the malign influences too often created by congregations of civilized humanity.

To us today trees are valuable chiefly for their uses when cut down; secondarily as elements in scenery. But later on we may evolve to the level of being able to recover some of those lost Mysteries which made Nature mean so much more to the ancients, but which survive now only in the distorted and fragmentary form that gives color to the sneers of our scholars. Then neither theology nor science will be so comic and trivial as they often are.

STUDENT

**The Taximeter Cab in Ancient Rome**

AN antiquarian has discovered, in a book on architecture written by Capra of Cremona in the 17th century, some drawings and descriptions of a mileage recorder designed by Vitruvius, engineer to Augustus, as Capra imagined this to be. Says Capra in his description:

Fix on the wheel of the car a disk bearing on its circumference a single cogwheel working into another disk having 400 cogs. On the side of this second disk a cog larger than the others will set in motion a horizontal disk which also bears 400 cogs and is furnished besides on its flat part with a certain number of holes in which there are little balls; these will fall one by one into a tube, when the rotation of the disk will lead them to its orifice; they will then reunite in a brass vase. One ball falling after each mile traversed, the number of miles done in a day will be known by counting the balls which have fallen in all.

## Some Views on XXth Century Problems

### Length and Breadth in Life

PEOPLE seem to be more anxious to have long lives than broad ones. The broad or full one is difficult to get, requires hard and continuous use of will; the long one, they think, may sometime be made easy; some elixir, some application of electricity, and the decades will obligingly bud out of each other like polyps.

It will never be so; any extension of life must be conquered; and the lengthening is the reward of the same efforts that would broaden.

Most of us waste—which is the same as not growing in—four-fifths of each waking hour. No hour is filled with more than a fraction of its possible contents. Suppose we decide to think of something, the tariff, the earth's rotation, or how we shall answer a letter. A stenographer is at our elbow; not the ordinary kind, but one who records *thoughts* verbatim. After we have done thinking of the matter, he goes away with his notes. A year later he shows them to us. We have forgotten what we were then thinking about, and he challenges us from a study of the notes, to find out, to make any guess! But at last, studying them as one would a cryptogram, we do perceive that scattered thoughts concerning the tariff are perhaps more numerous than those concerning other matters. We were "thinking" about the tariff. The total thinking took half an hour; but if the actually relevant thoughts were put end to end and repeated ones ruled out, the time would be perhaps one minute. Twenty-nine minutes wasted. Most people, reading ten lines of poetry and then trying to remember the first one, would not get its first word. The attempt to do so would show them the extraordinarily wobbly instrument with which they are content to waste their lives.

But at least we are concentrated upon our amusements? Mozart, as a boy, once listened to a choral service. When he got home he wrote it down note for note. We go to hear music in order to exercise a non-intellectualizing part of our consciousness. Yet we permit the intellectualizing part to inject five or six thoughts, memories, anticipations, into every bar. We suppose ourselves to be listening; as a matter of fact we only listen by jumps, just numerous enough to keep up the superficial illusion of continuity. The benefit of the music is therefore say a fifth of what it might be. Every speaker knows that his audience only listens about a fifth of the time, and so he repeats his points often and spreads them a good way apart.

Our minds are in a chronic state of exhaustion, so chronic that we do not know it, consider it normal. They are as our bodies would be if every muscle twitched continually from morning to night, not only when not in use but even more violently when needed for steady action.

This incapacity for steadiness has almost completely cut us off from the spiritual world, just as a body whose every muscle continuously twitched and jerked about would almost shut us out from the mental world. Mind,

like all things else, is athrill with spiritual life; but it can know little indeed of that life until it has learned to stop its outward rushing activity, its ceaseless jerks and twists, and look straight and still inward upon real being. We have almost ceased to try, so hopeless seems the task. The hopelessness has been translated into a dogma, and we are told that there is no spiritual life or that it is unknowable.

Whatsoever there is to do, let it be done as well as possible, said the Galilean Christ, dealing exactly with this difficulty. A man has to walk two blocks from the car to his office. Does he do it well? On the contrary his mind is already in his office, or all over the world. His body scrambles along as best it may. Does not the walk of the ordinary man and his physical attitude, look as if his body had always been let to come along anyhow it liked? Why not walk those two blocks erectly and well, the mind energizing the body and controlling its tendency to slouch? Mind and body alike would benefit. In learning a foreign language, why not so read a sentence in it, even containing unknown words, that we can at once look up and repeat it.

In fine, if we would live broadly and deeply, live five times as much in a moment as we live now, we must reduce the mind to obedience to the will, so that it stays doing what it has been told to do until another command comes. This may be a long task, but the rewards begin to come the first day. It is the only way to the dignity of divine manhood, to true self-consciousness, to true life. STUDENT

### Another Way with the Criminal

THE treatment of criminals seems to be gradually becoming a live issue. Its vitalization has been slow because society is slow to recognize that it is itself the final sufferer for every evil and injustice done to the criminal. Society contains in solution all the effects of all the evils done with its connivance or by its direction. Under temptation a young man slips and commits a theft. In prison he is lodged in the same cell with a hardened criminal, is subjected to the same dehumanizing regimen, for five years breathes and thinks in the sullen atmosphere of criminality.

When he comes out his slip is registered in his constitution. Society has constructed a criminal for itself, an embittered enemy of its laws and methods. In the intervals of his future immurements, besides his crimes, he will become the parent of children. These are the obvious facts of the case. But if we could follow out to the last link the chains of cause and effect setting from this man, we should find that in two or three generations there would not be a single person then living whose life had not been in some way, to some degree, affected for the worse by this one man—made what he was by the society which thus has to take the man and all his deeds home to itself.

And then what of the "hardened criminal" with whom this young man was associated? Is he, is anybody, an absolutely hardened crim-

inal with no human heart of manliness to be reached? If not, is there anything in the present prison regimen that can possibly reach and rouse that heart? Or is the whole of it indurating, embittering, sullenizing, dehumanizing?

He walks in a chain-gang, lock-step, to a religious service once a month, even twice; there may be a Bible in the cell. Do these facts constitute an affirmative answer to the questions?

The criminal is a man whose act has compelled us to separate him from freedom. Why return him to freedom *worsened*?

Why not, for instance, touch the man with music? His evenings are bleak enough to make him welcome anything, attend to anything. Since he is to come back among us anyhow, may he not just as well come back touched with music? If he is to burgle again anyhow, perhaps he would be a little less ready to add murder to it if he had learned to play.

Details remain to work out. They may be very difficult to work out. But their *principle* will be clear—to turn out a slightly bettered, softened man instead of a worsened one; a man slightly less likely to commit crime than considerably more likely. No one supposes our present purely punitive system is deterrent, that a burglar who has had five years of it defers his next burglary five minutes because of it. He simply hopes for better luck, or takes one more precaution that he had forgotten before.

And lastly, a proper prison system includes care of the man for a while after. His imprisonment is supposed to pay his debt to outraged society. But when he emerges he finds, of course, that the doors of honest living are almost completely closed to him. He may be nearly as much of an outlaw as when in prison. Society is still exacting payment of him. What wonder if he thinks the only way to meet the debt is to contract a new one? STUDENT

### The Real Man

"THEN we saw the real man," says a contemporary critic, speaking of a certain man of letters whose private life would not bear, but got, the light of day.

But suppose the man of letters, a poet and essayist, had written nothing, had lived a consistent debauchee only, and had finally been exposed and imprisoned. In prison he produces a couple of beautiful poems and an essay of very elevated feeling. Should we not be equally—more—justified in saying, Now we see the real man? It was he, the *real* man, who was overlaid by the drink and debauchery, and who, when these became impossible, could speak.

There is a real man in all of us, not necessarily overlaid and imprisoned by drink and debauchery, but none the less effectually silenced by the thousand pettinesses of thought and ambition, by want of education (e-ducation, the *leading forth*) and by non-recongnition and denial of it. Those who claim that self-expression is the one law of conduct forget that "self"-repression must come first. C.

# Archaeology Palaeontology Ethnology

## Roman Baths at Bath, England

**B**ATH has been celebrated for its thermal and medicinal springs since at least the time of the Romans, and legend, not less reliable than history, traces its origin still farther back. Numerous remains of the Roman *Aquae Solis* ("waters of the sun") exist, and one is illustrated herewith. This Roman bath now lies, by that mysterious process which causes old sites to sink, or new ones to rise, below street level, as shown by the two statues in the right center of the cut. It was excavated about 20 years ago and is about 70 ft. by 30. The water still runs in from hot springs at about 125° F. E.

## Kings Before Menes

**T**O return to the early historical period. This has been set back and verified in a high degree by the recent discoveries in Abydos, by Dr. Flinders Petrie, by his finding tombs of the seven early kings of Egypt, before Menes. The period of the earliest of these kings is certain to be nearly 7000 years ago.

What is most interesting to observe in Dr. Flinders Petrie's discoveries was that the early kings, 7000 years ago, possessed the art of writing in hieroglyphics, so that their names are recorded. The first historical name we possess at present is that of a king Ka; the second Ro; then follow Zeser, Narmer and Sma.—*Scientific American Supplement*, August 15

## Discovery of Prehistoric Pictures in Spain—An Unanswered Scientific Enigma

**T**HE Preliminary Report has just been issued concerning the strange discoveries in the caves of Altamira, Spain, first announced in 1880 but not properly examined and described till lately. The principal cavern is a large hall 75 ft. by 19 ft. whose walls are decorated with a marvelous series of paintings in various colors, and carvings, by prehistoric man. They chiefly represent the animals with which he was familiar, and whose remains are found in the cave-passages, such as the aurochs, the horse, the stag, the boar, the cow, and the goat, and they are executed with great fidelity to nature. There are also marks which seem to be hieroglyphics. If these prove so, they will be the earliest known specimens of writing yet found.

With these, however, were found also a considerable number of peculiar drawings which at first were the cause of various and profound thought among their discoverers. Finally . . . it was concluded that they represented "human creatures," owing to their arms, hands, legs, and ears. . . . These remarkable creatures have not a human, but

an animal, head, with a strongly projecting snout, and this resemblance is scientifically of the greatest significance. That dancing persons with arms uplifted to implore and with animal masks are meant and represented, as the authors seem to believe, is, in the opinion of Wilser, cited in the *Centralblatt für Anthropologie*, most improbable, and also does not explain certain other animal characteristics. As the artists of remote antiquity knew how to picture various animals with perfect fidelity to nature, we must admit that in this instance also they drew from life, and that at that time there still lived in Europe such creatures, closely related to the common ancestor of the great ape and man. But what kind were the artists? (From an article in *Umschau*, translated for *Literary Digest*)

A similar series of animal pictures was found in Southern France, at La Mouthe, Dordogne, some years ago in a cavern of unknown but enormous age, and it is now believed that the Spanish ones are equally old.

Without careful reproductions of the pictures it is impossible to consider the question at all completely, but from the general description we are forcibly reminded of the half-human, half-bestial creatures mentioned by H. P. Blavatsky in *The Secret Doctrine* (which were extinct ages before these cave-pictures were drawn) as having existed in the earlier times of the lost continent of Atlantis or perhaps before. She repudiates the idea that they were the "missing link," and explains that such semi-human creatures were degenerate forms, partly descended from man, and not

destined to persist. The intellectual principle which makes Man has never passed through the irrational condition of the physical ape in the primeval forests. Singularly enough, from the ordinary standpoint, we are not acquainted with the skeletons of the nondescripts represented in the cave-pictures which are probably the representations of half-forgotten tribal legends and memories of former days. But, according to the doctrines of the Teachers from whom H. P. Blavatsky derived her knowledge, such creatures lived on lands now submerged, and had died out aeons before the period of these "recent" cave-dwellers, and we are not likely to find their remains until the fountains of the great deep are broken up and the sedimentary beds now forming under the Atlantic and Pacific Oceans are upheaved.

## Ancient Egyptian Cloth as Good as Ours

**T**HE yards of cloth that swathed Khnum-Nekht's embalmed remains were unwound recently at the Manchester University and pieces distributed far and wide as presents. Some thirty pieces were available for distribution among the members of the Microscopical Society, and some of the members declare that their examination has upset some of the theories about our civilization. It is emphatically declared that the weaving of the mummycloth is as good as that of the same material with all the modern appliances of today. And why not? T.

# The Trend of Twentieth Century Science

## The Lady of the Lake

WE do not want to accuse a reputable scientific man of believing that lakes have souls, and of endowing with a scientific backbone the graceful and poetic, but unevenced legends of the past. In legends, as every properly reared child knows, lakes have souls; and when the prince draws near, the soul rises in the form of a beautiful maiden and gives him material of much value to him in his forthcoming fight with the giant. The poets too, have sung of the souls of the lakes, communing with them and getting inspiration from them. They might not be willing to defend their beliefs before the debating societies of keen and omniscient and all-sceptical young men; but some of them do seem to think that the all-pervading nature-consciousness comes to a focus as an elemental entity in lakes, and so can there be more easily touched.

The President of the American Fisheries Society is the scientific man whom we do not want to accuse of being a secret poet. Still, he began his address before the Society in this way:

An inland lake has often been compared to a living being, and this has always seemed to me one of the happiest attempts to find resemblances between animate and inanimate objects. Unlike many such comparisons, which turn on a single point of resemblance and whose fitness disappears, as soon as the objects are viewed from a different position, the appropriateness of this increases rather than diminishes as our knowledge both of lakes and of living beings is enlarged.

A lake, like a living organism, is born, endures, grows old, dies. Whilst remaining as an entity, its body is in continual change. It evaporates away and is restored by the rain or by streams. It shows

not only the cycle of individual existence, but also the rhythm of seasonal activity. . . . The comparison may be pushed further and extended to the minor fluctuations of the vigor of vital manifestations which characterize lake and organism alike.

The blood of the lake is the water, containing salts in solution. The body is the sides, covered to the very bottom with living tissue. The corpuscles are the living creatures swimming about. They need oxygen, and so the lake breathes; and they supply carbonic oxide and other matters to the vegetation of the banks and depths.

The lake breathes, and that was the Professor's main topic. It absorbs oxygen, and this is finally breathed back to the air in combination as carbonic oxide.

Speaking roughly, and in terms of our comparison, we may say that an inland lake is an organism which takes one full inspiration in the fall, and another, less complete, in the early spring; that during the winter it does not breathe at all and during the summer has only a very shallow and imperfect respiration.

It cools during the autumn, and so, before freezing at the top, becomes of about equal temperature throughout. Not only does its coolness enable it to dissolve about twice as

much oxygen as it will hold in summer, but the uniformity at all depths enables the wind to turn it little by little all over and thoroughly expose it. In summer a warm layer persists on the top and this only gets turned over.

So it enters upon the winter fully charged with all the oxygen its inhabitants will need for the time the surface is frozen. By the end of the winter this is nearly used up; the water is charged with carbonic oxide, and the living creatures are ready enough for the next breath. This breath is taken when spring comes, and for a short time the uniform temperature once more enables the wind to turn over all the water. As the water warms with summer, it can dissolve less and less oxygen, and the wind can only work on the warm layer of the surface. But the living creatures can now come up to the air and take part of what they want. It is supposed that the cool deep layers, into which the dead vegetation and dead animals sink and oxidize, must then become almost exhausted of their oxygen and correspondingly unfitted for much life. But, the Professor suggests, there may be facts preventing this, of which we now know nothing. Freshwater springs, charged with air, may enter from below. Slender filaments of water may push deeper and connect with warmer strata in the crust, causing an ascent by night from the bottom with a corresponding descent from the top. And lightning or other form of electricity may electrolyse the water to the very bottom, liberating all necessary oxygen.

Altogether, the poets are once more welcome to regard a lake as an entity with a complex life of its own. STUDENT

## The Mystery of Tobacco

SOME tobacco figures, covering the years 1899-1908, have just been published by the commissioner of internal revenue. During this period every use of the plant has increased to an extraordinary degree. Eight billion cigars is now the annual dose, as against five billion in 1899. Snuff has advanced from 14 million pounds to 22; tobacco in the pipe-smoking and chewing forms stood at 237 million pounds; it stands at 364; manufactured cigarettes were 2800 million; they are 5400. But this does not include cigarettes made by the hand of the smoker.

The report, and all comments, lay most stress upon the cigarette item. To its use in cigarette form, the greater part of the evils of tobacco are justly ascribed.

Why is the cigarette more harmful than the pipe or cigar? That no one knows, may be gathered from the multiplication of theories. But it is more harmful; that is certain. A given number of hours spent in unbroken cigarette-smoking will do very much more harm than the same continuity of pipes or cigars. And this comparison reveals part of the still hidden secret of tobacco. When the five-, three-, or one-inch column is lit, that of the cigar, cigarette, or pipe, a certain effect particularly desired by the smoker is obtained

from the first three or four whiffs which does not result from later ones. Whether this first effect is called stimulating or sedative, it is much more marked than that yielded by the rest of the burning column. It is claimed by tobacco-using mind-workers that this primary effect is facilitative to their work. The hot smoke resulting from the just lit surface is drawn through the rest of the tobacco into the mouth and must carry with it whatever ingredient of the tobacco is volatile at that temperature. That gone, the effects alter somewhat. If smoking be harmful, or harmful beyond a certain point, it would seem that the maximum of the harm is done in the first whiffs. But a steady cigarette smoker will have about five times as many of these first potent whiffs as a steady pipe or cigar smoker, merely because he will smoke five times as many cigarettes as they pipes or cigars. Suppose that moderate smoking is beneficial for brain work, and that the brain can usefully accept the stimulus of the first distillation of tobacco four times a day. Perhaps four times is as often as the average pipe smoker will light a pipe in the day. But the average cigarette smoker will easily light fifteen or sixteen of his doses: all but four of them, according to the hypothesis, being noxious and depressant.

This seems to be a reasonable explanation of the unquestionable impeachability of the cigarette. And we may remember in addition, that the cigarette smoker makes the very utmost of his whiffs by inhaling them.

The effects of tobacco are as yet but little understood. It contains nicotine; its smoke contains carbonic oxide and dioxide, ammonia, and various tarry matters. But it is more than doubtful whether, if we could combine all the known ingredients and then inhale them in the proper proportion, we should get the effect of the herb. We could get the grosser injuries, heart depression and so on. But would the smoker get that subtle clearing of his mind which he has trained himself to seek, and which, attempted too often, will, he admits, be replaced by its opposite with a darkening of all the brain lights? The Indians, in their councils, pass round the pipe of the herb which is to them sacred and from the gods. Each takes two or three whiffs only, and then, the effect attained, hands on the pipe. There would be no tobacco heart, trembling hands, and sallow faces, if we did that with the plant.

Those who are making a case against the use of tobacco often forget an indictment that could only be repelled by a reply of *misuse*. The slave, the man who cannot read or write comfortably without smoke, cannot concentrate his mind. Every few seconds consciousness has to let go its train of *thought* in order to get a *sensation*. The demand arises and is met. It is clear that the philosophic ideal of "thought moving on into the essence of its subject like a stream of oil," is impossible to the enslaved smoker. He is chained to a point in his environment to which he must constantly return for a new start. STUDENT

## A Japanese Pearl Oyster Farm

**I**N Japan the pearl oyster fisheries were so much overworked that a pearl oyster farm was established to conserve the industry. This is in a bay on the Pacific coast where the water is still and sheltered by innumerable land barriers. The breeding season is in July and August, and this is prepared for by placing stones over the bottom in the shallow places. To these stones the young oysters are attached, and they are allowed to remain until November, when stones and shells are both transferred to deeper water, to protect them against the winter's cold. After growth for three years, the young oysters, now two or three inches long, are removed and the operation of putting nuclei into the shells is performed.

They are then put back into the sea for another three or four years, after which they are taken out and opened, and the pearls put on the market. E.

## Improving the Public Roads

**T**HE Office of Public Roads, United States Department of Agriculture, is inaugurating a plan of co-operation with the newspaper press of the whole country, in order to dispel the general ignorance, in all its local habitations, by the light of knowledge as shed by the experts on road-making. There are nearly 2,500,000 miles of public roads; and on these about \$80,000,000 a year is spent, much of it being wasted from lack of proper methods. To remedy this, the Office proposes to send the papers a monthly article describing how to deal with the roads, the instructions being adapted to the particular kind of roads in the different localities. It invites the papers to conduct a correspondence column in connexion with the articles and undertakes to answer the queries free of expense. Besides this, the formation of local committees is recommended, to deal with road government, road making, road financing, traffic, etc.; and the Office will second such efforts by sending around lecturers.

In this connexion may be mentioned some figures given by the chairman of the Buckingham County Council in defence against a

charge of extravagance. He said that during the six years ended March 1907, the annual cost of rural main roads throughout England and Wales increased by £320,000, equal to 20 per cent. In the Home Counties, where the increase in self-propelled traffic had been greatest, the annual increase in cost was given as 63, 27, 49, 22, 60, 35, and 77 per cent. respectively.

Also we notice an illustrated description in an English paper of a new road-train with an engine and several wagons or coaches, each wagon or coach being self-propelled, not trailed. This may be excellent from one point of view, but what about the roads? The problem of finding roads to stand self-propelled rubber-clad wheels is becoming serious. T.

## Imported Wood in Germany

**H**ERE is an item to be considered in connexion with forest conservation. The German Empire, says an account, has nearly 35,000,000 acres of forests. Of this, 31.9 per cent. belongs to the State, 1.8 to the Crown, 16.1 to communities, 46.5 to private persons, and the remainder to institutions and associations. There is a little over three-fifths of an acre of forest for each person; and, though 53 cubic feet of wood to the acre is produced in a year, *wood imports have increasingly exceeded wood exports for over forty years*, and 300,000,000 cubic feet, valued

at over one-sixth of the home consumption, are now imported each year. This wood comes from Austria-Hungary (19,750,000 tons), Russia and Finland (18,000,000), Sweden (508,000), and the United States (49,000).

One naturally asks, What chance do we stand? What chance does the world stand? It would seem impossible to grow as much wood as the world wants. Perhaps necessity, if nothing else, will compel us to construct more of durable articles and less of perishable ones than we do at present. Much of the frippery of life could doubtless be dispensed with without disadvantage; and for one thing, the bulk of printed pages, to which our forests are so largely sacrificed, might well be reduced greatly. STUDENT

## Wonderful Yield of Honey

**A** WRITER to *The Scotsman* chronicles the following instance of the wonderful productivity of the bee. Three colonies (swarms from other hives) were put in an empty Wells hive containing 20 bar frames and 36 sections. In a fortnight it was found that all the bar frames and sections were completely filled. Averaging each frame at 4 lbs., and the sections at 1 lb. apiece, which is below the mark, the amount of honey collected in a fortnight was 116 lbs. It was gathered mostly from wild mustard which abounded near. T.

## NO STAR IS EVER LOST

Adelaide A. Procter

**H**AVE we not all, amid life's petty strife,  
Some pure ideal of a noble life  
That once seemed possible? Did we not hear  
The flutter of its wings and feel it near,  
And just within our reach? It was. And yet  
We lost it in this daily jar and fret.  
But still our place is kept and it will wait,  
Ready for us to fill it, soon or late.  
No star is ever lost we once have seen:  
We always may be what we might have been.

## What the World Needs

Seek ye first the Kingdom of God and his righteousness and all these (other) things shall be added unto you.

**I**N a world where the men and women are living unbalanced, selfish lives, lacking self-control and self-reliance, they trust and depend on things and ideas exterior to themselves. What they need, as they think in their brain minds, is money, position, and the good opinion of their fellows; these they consider produce happiness, and without them they are unhappy. Their minds, their thoughts and desires are bent on getting these conventional "necessities," which they regard as the be-all and end-all of life. So they are in a perpetual unhappy restlessness, striving to get that which will only add to their burden, for when they have got it, they are worried by the desire to keep it and the fear of losing it. No one can read a little of Theosophy and not see the error of this deluded strife, for strife it is. Such of us as seek these exterior things are working for what most others are working for, and the struggle becomes competitive, hate and fear producing. Why do we act thus? Is it not because we have lost, and hence are not guided by, a rational and true philosophy of life? Is it not that men and women have lost the inner knowledge of their divine origin, their true nature, power, and destiny? They have come to think they are the grasping, self-getting, self-keeping creatures they have made themselves seem by such undignified living. They think they are the separable, non-related beings which their acts portray them to be.

But is there any need to think and act like this any longer? What the world needs — is it not a true philosophy of life; and true, compassionate, fearless, noble-hearted men and women who will make that true philosophy a living power in their every thought and act? And once more this true philosophy of life has been brought, expounded, and demonstrated, by those true Teachers, H. P. Blavatsky, William Q. Judge, and Katherine Tingley. Theosophy stated, explained and lived is what the world needs. In it we find the teachings otherwise so sadly lacking in the world, of man's divine origin and nature, his power and destiny. He is not in reality the money-grabbing selfish slave to worldly opinion. He is a living, immortal, divine soul, not a crea-

ture that has a soul which is to be avoided, kept asleep and quiet — if we are to judge by the lives of most men and women — but that he truly and actually is the divine soul itself.

What a wonderful idea. Man is not an animal body, not its desires and feelings, nor even the thoughts that he has. He is the divine evolving Self, who knows, who is here to gain experience, through the consciousness of his animal body, and who permits and has the power to control the thoughts and feelings of his brain-mind and personal self. Yet he is *not* these, nor the sum total of them. He, in his real nature, is the impersonal, universally related, spiritual being, who by his oneness with all affects all by his character, his motives, and his daily acts and thoughts.

This we assert is what man needs. Theosophy, which explains and demonstrates his unity with all and hence his responsibility for the true progress and welfare of all. His character and conduct affect all for weal or woe, as he is also affected by all. What a vastly noble and truly important being the teaching of Theosophy shows man to be, even if he only lived here for one earth life. But Theosophy shows and convinces us of more. It shows that the world is governed by law — divine law — and that as a man sows in one life so must he and will he reap in this or in a future life. But more glorious still it shows that whatever a man may discover his life to be, however wrongly he may have lived, if he will but recognize the divine spark in his heart, he has still the power to turn round and choose to live nobly as a soul. He has the power to cease living wrongly and doing evil, to cease even the negatively good life, and to live the positively active, and fearlessly unselfish life; for he is a divine soul and has the power to choose and to determine to hold to his choice. He has the power to cease to live negatively on the love of others, always seeking for self and selfishly getting only for self, and to begin to live a positive, active, willing life of service and helpfulness to others, seeking to live and get so that he may give help, love and life for the benefit of all his fellows. By so doing he becomes a lifter of the world's burdens, a helper and benefactor of his race.

Truly it is Theosophy that the world needs, for it alone is capable of restoring to man his birthright of Truth, and giving balance to his nature and conduct. Its message is that man is Divine and that only by living as a Divine being for the benefit of all, can he fulfil the law of his being. Theosophy alone shows the way.

A. S.

## The Greatness of Small Things

**T**HE longer we regard life from the Theosophical standpoint the more we become impressed with the importance of what are usually considered the *small things*, and begin to understand that in a true philosophy of life there can be no small things in the sense of *unimportant*.

The oak tree grows from the acorn, and all seeds are small in proportion to the effects they generate. As it is in the growth of natural things, so it is with man, for all evolution is growth. The trend of our characters, the positions we find ourselves in in life, our ability, or stupidity, are all the result of our daily thoughts and actions.

Little by little, day after day, we are weaving our future destiny for this life and for the lives that will follow it upon this earth, as the Soul takes again new vehicles of expression to continue its evolution. The characters with which we find ourselves at present endowed are the visible effect of the hidden grain of brotherly action or the tares of selfishness sown in the homely every-day doings of our past-lived lives. Theosophy also brings home one very important lesson we need well to impress ourselves with if we wish to work out our destiny intelligently — that we do not live under a rule of *chance* but of law, and that every effect must have a cause; and not only that, but that in this orderly Universe, Divine Laws of Nature exist for the governance of man and all that is, and that it is a very sorry game to fight against the inevitable.

An intelligent study of life in the Light of Theosophy shows us some of these Laws, and the state of the world today with so many unhappy and ignorant people as a result of a disregard of and foolish rebellion against these great natural laws.

To take an instance, the fundamental law of Human Brotherhood. Do nations act towards each other as if that were a law of Nature? Do people so act towards each other? Do we ourselves? Then again, take that stupendous factor in human evolution, the *duality* of our natures, the so-little realized ever-waging war within our breasts betwixt the animal and the Divine. Do we always give of our strength and will for the triumph of right over wrong? Yet the certainty of our personal Immortality lies with the victory of the Spiritual Nature over the Material. And to all these *great things* the *small things* are intimately related. Every simple little duty of everyday life can be carried out with the spirit of altruism or against it. We may sow the seeds for the future of an expanded vision, a larger helpfulness, joy and peace: or an ever narrowing horizon, a loss of discriminative power, a paralysis of the higher qualities, causing ignorance and consequently sorrow. Are these little things then so small, when the manner of their doing is fraught with so much of weal or woe? when they are daily making us either more animal or divine?

Let us recognize rather our importance as units of the great human family and the privilege we have in helping onward the evolution of the Whole by the faithful performance of our *small* duties. This will gradually fit us for a larger work of the common good through the strengthening and ennobling of our lives and natures. In the words of the Poet Goethe

Like the star  
That shines afar,  
Without haste and without rest,  
Let each man wheel with steady sway  
Round the task that rules the day,  
And do his best.

Rest assured in the justice of the Higher Law, "which gives to each one that which is his due, in perfect equity, which must be perfect love."

STUDENT

If we could look behind the scenes, there would be much that would inspire us, because of the promise of the hour, and the Light that Theosophy is giving to the world. —Katherine Tingley

# THEOSOPHICAL FORUM

Conducted by J. H. Fussell

## Question

The question is sometimes asked, "Which influences the other more, circumstances or character?" Please answer this in the Theosophical Forum.

## Answer

The answer is that each influences the other, but character is the stronger. Our ideal should be to render our character so strong that it can adapt itself to any circumstances, and modify them rather than be modified by them. This teaching is familiar to those who have read the Stoics, Marcus Aurelius for instance. There are many noble instances of its practice, and they point the way for the rest of mankind. As each human Soul has limitless opportunity before it, we may all attain to these heights and even greater ones.

Still we must not ignore the influence of circumstances on character. That also must be taken into account by the wise man. There is no need to make our task unnecessarily hard for want of a few simple precautions. What we have to guard against is the tendency to give *undue* importance to circumstances. If we give too much importance to circumstances, then we weaken our power to cope with them and fail to learn the lessons and gain the strength which they afford us. On the other hand it may sometimes be profitable to change the circumstances.

The frequent cry, "If only I had other circumstances, I might do so much more," is a great mistake. The other circumstances seem pleasanter so long as they are only prospective and imaginary, because we fail to realize the difficulties and see only the pleasant features. But when they come into actual reality, they will be found as exacting and as hard to cope with as our present ones.

We have two kinds of environment, that which is external and that which is in ourselves. We have to strengthen the latter so that it can be strong enough to cope with the former. We must be able to carry our circumstances about with us.

The struggle is due to discord between our desires and our environment. These must be brought into harmony. The process is one of mutual adaptation between the two. The Eastern proverb, "Is not the whole world leather-covered to him who wears shoes?" means that we must clothe ourselves in the garb of contentment, which will protect us against the wear of circumstance.

There are many in this civilization who find themselves in circumstances that are a ceaseless struggle of labor with want. While Theosophy teaches men to help their distressed brothers, and labors to bring about a better state of society, it also shows the distressed how they may best *help themselves* to alleviate their present lot and earn a better one—and this by far the nobler task, for it lays the axe at the root of the cause. Circumstances are intended for our education; and, if we accept the lessons they teach, we make true progress and fit ourselves for other conditions. If we cannot change our circumstances at once, we can at least change our attitude of mind towards them. It is better to realize that we ourselves were the authors of those

circumstances, and that by our present acts will our future circumstances be determined, than to believe that we are playthings of irresponsible fate or of a capricious Power.

All clear thinkers see that character and self-dependence are the only sure basis of society, and that we cannot found a new order of society on mutual distrust and self-seeking. The man of character is never out of place, and rises like a cork; but it is no use trying to accommodate the man who is inefficient and never content. But what people do not see is a source from which strength of character can be derived. This is where Theosophy supplies the need; for its teachings harmonize with our moral intuitions, instead of being at variance with them like many religious and scientific dogmas. It affords solutions to those vexed questions of life that underlie all social problems and that religion and science fail to solve. It teaches Man how to rule his circumstances, especially his interior circumstances, instead of being their slave. In place of the depreciatory and pessimistic doctrines about human nature that seem to form the basis of all our schemes for improvement, it reveals to Man his own dignity and masterfulness. It shows him that the influence of character over circumstances is paramount. E.

## Question

One of the objects of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY is to "teach Brotherhood and demonstrate that it is a fact in nature." How can it be demonstrated?

## Answer

The fundamental teaching of Theosophy that "all men have spiritually and physically the same origin" and that therefore "Brotherhood is a fact in nature" may be demonstrated on logical, philosophical, metaphysical, and even scientific grounds.

Theosophy teaches that all the life which we see manifested in various forms is in reality the same in essence. Let us see if this is not so. We, as members of the human family appear to our physical eyes to be entirely separate beings, independent of one another; yet on closer examination do we not find that in all the divisions of our nature, we not only resemble one another but are made up of identically the same elements? Take our physical bodies, for instance, which science teaches are, together with their various organs, made up of millions of little living cells; which in their turn, Theosophy shows, are divided into still minuter lives. These lives or atoms are constantly changing not only from one human body to another, but the same atom may at different times have been part of every form of life from the mineral up to man. Thus we can see that our bodies are not fixed, separate forms, but are constantly changing and furthermore, that they do not belong exclusively to each one of us, because the living particles of which they are now composed are constantly leaving and others coming in. If we look still further into our natures we shall find that our thoughts do not belong to us alone, but that we are as it were in a great stream or ocean of thought, for do we not often find that others have had identically the same thoughts, sometimes even at the very same time? If we look far enough we may see

that mind is in fact a universally diffused principle.

Is it not also the same with our feelings and emotions? The longer we live and the more we study our fellows the more we realize that we all have the same feelings to a greater or less degree.

The Theosophical teaching that Brotherhood is a fact in nature, however, rests on a more lasting and deeper foundation than that which we know of man through his outer manifestation, namely, his spiritual unity. It is through a knowledge of this spiritual unity that mankind will come not only to realize the truth that Brotherhood is a fact in nature, but to live Brotherhood.

Scientists have proved the identity of man's physical origin; yet we do not find them showing any great fraternal affection. This is because, as H. P. Blavatsky says in *The Key to Theosophy*:

The identity of our physical origin makes no appeal to our higher and deeper feelings; matter deprived of its Soul and Spirit cannot speak to the human heart. But the identity of the Soul and Spirit of the real immortal man, as Theosophy teaches us, once proven and deeply rooted in our hearts, would lead us far on the road of real charity and goodwill.

The mineral, animal, and human kingdoms are all manifestations of the One Universal Life. In the kingdoms below man, progress is made by natural impulse. In the human kingdom each individual must voluntarily choose whether he will progress or not. Man, therefore, has the choice of practising selfishness or altruism; but in order to progress he must choose the latter, as human progress and happiness are only to be attained by mutual helpfulness, which is the law of the One Life.

All through nature mutual helpfulness is necessary for growth and progress. Humanity is under the same law. The practice of brotherhood would result in peace, happiness, and contentment. On the other hand, unbrotherliness and selfishness cause strife and misery.

Brotherhood is a fact in nature which we may not ignore without self-injury. "Laws of life are laws of harmony" and are their own avengers. They bring re-adjustment with unerring justice. Although human solidarity is a great truth, the illusion of separateness existing as it does in the minds of men, causes them to seek that which they consider best for their own personal advantage, without regard for the welfare of others; thereby not only injuring themselves but all humanity. In so doing man forgets his identity with the One Life which in reality binds all together, for the real, permanent part of man is not the outer changing body, but "the inner soul, the spark of the great Flame."

B. F. V.

We would that all who have a voice in the education of the masses should first know and then teach that the safest guides to human happiness and enlightenment are those writings which have descended to us from the remotest antiquity; and that nobler spiritual aspirations and a higher average morality prevail in the countries where the people take their precepts as the rule of their lives.—*H. P. Blavatsky*

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

## The Flying Moment

WHERE shall we find a refuge and a home?

The past wings its swift flight toward oblivion, futurity is not in view and when it does appear, its pictures flash for just a moment's space upon the screen of time and vanish in the dark. The present seems to be a mere imaginary line which the future must traverse in its progress to the past. How can we hope for lasting satisfaction in the flying moment? It would be just as useless as to try to moor our boat upon Niagara Falls.

The lower mind absorbed in its enjoyment of the fleeting brain life and immersed in the sensations of the body, that portion of the screen of time which lies in the immediate purview of the soul, vainly attempts to build a dwelling place upon the shifting present out of the roaring cataract of sense impressions madly surging by. Yet from remotest times mystics have always said there is a place in which the soul may stand changeless, exultant, satisfied, serene. Time-worn and tempest-tossed we may retire into the peaceful haven deep within where future, present, and events long since gone by exist in the Eternal Now. Those who have moved into that inmost place regret no ancient glories, long for no future good; but to their calm beholding eye all times unroll their fadeless panorama. The man whose interests lie in his emotions and in sensuous delight is like a boy who hunts the *ignis fatuus*. When the expected moment comes it instantly departs and as he tries to seize the next it follows like the lightning on its predecessor's track. His pleasure always just ahead continually eludes his grasp, so can we wonder that the faces of the seekers after pleasure wear the stamp of desperate, permanent, unsatisfied desire?

And yet the fleeting present is our only time to act. We cannot labor in the past, nor in the future; there is but left the *Eternal Now*. We sometimes shirk our present duties as we form our plans for future work, and fail to freight the moments as they pass us by with living impulses of helpfulness and brotherly goodwill. Moment by moment, we may store within the flying present, treasure for men of future days, filling each instant with the harmony which is our contribution to the cosmic song, so when the future comes we are ready and alert to grasp our opportunities. P. L.

## MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

## Alcoholism, Psychism, Insanity

STATISTICS prepared in an asylum for male inebriates in France, and dealing with 2493 patients received in 9 years, show that "from the practical and medico-legal point of view, every alcoholic is a potential criminal." Almost all had, before their entry, exhibited harmful or destructive tendencies. We are told that—

All these acts depend in general upon more or less conscient motor impulses, more or less well preserved in the memory. In any case, those who commit these acts are utterly irresponsible.

Whatever may be our philosophy of these "more or less conscient (conscious) motor impulses," the practical issue remains the same,—namely, that the inebriate has lost self-control, and his organism has become the tool of dangerous hostile forces.

The hospital cured many cases; but the conditions for creating more cases remain. Alcoholism is but one particular form of the loss of self-control. There are others, such as drug-taking and depraved habits. Insanity, an extreme case of loss of self-control, may result from these causes or from less definite causes. It may gradually accumulate from generation to generation, though it is at any stage amenable to cure.

One of the greatest dangers to civilization is from "psychism." Some practices coming under this name include relaxing all one's muscles, rendering the mind as blank and receptive as possible, and expecting the arrival of influences which will enter the system. Could any more effective means of courting insanity be devised? The invisible thought-atmosphere around us is teeming with impure, violent, or chaotic *thought-forms*, ready to attach themselves to any unguarded human organism and vent themselves thereby. We need to render ourselves strongly positive to these forces, and to be ever on guard against their entry. What folly can be compared with

that of the man who deliberately courts them? Yea, even although he fondly imagines it is one of the sacred Trinity who will inspire him, the danger is unremoved; Divinity does not enter the man who lies relaxed with a blank mind, but the man who busies himself with Divinity's work—helping his fellow-man. Nor is the experiencing

of a pleasant physical sensation, a mental exhilaration, or even a sense of holiness, evidence of a creditable inspiration. Alcohol or drugs may induce such states.

This "psychism" is clearly one of the various forms of self-indulgence. It includes the two characteristic features of surrendering the will and of expecting pleasurable experiences.

The sure and steady increase of alcoholism, drug-taking, "psychism," nervous diseases, insanity, in our civilization, points to the danger that threatens it unless some potent contrary influence comes to our aid. For what will prevent them from increasing indefinitely?

Science, true Science, alone can save us; and true Science means the understanding of our whole make-up, physical, psychic, mental, and spiritual, and the basing of our whole life on the eternal truths. How to find our Individuality and exercise it—that is the key to self-control; and Theosophy, the age-old Religion-Science, alone can teach that. E.

## Greed, Stupidity and World-Destruction

NO sooner is the convention for the conservation of national resources over, than news comes that a company has purchased the only remaining valuable timber in the Appalachian region, two hundred thousand acres in extent, in West Virginia. Again, in a recent magazine, an article about the new patriotism—economic crisis brought about by national waste, disregard of the future, and so on—is preceded by another article entitled *The Riches of the Philippine Forests—Great Tracts Awaiting American Capital and Transportation Facilities*, and so on. Cut them all down! Does civilization demand that the world's timber, coal, and iron shall be destroyed without further delay and if possible before a new generation shall have arisen, and the earth converted into a desert with its plant-bearing soil all back in the sea by the floods? It does not. Is there no *world-patriotism*? An international convention is needed! J.

### At the Top of the Scale

IN according our admiration to the men who have dared the rigors of Polar research we usually forget their chiefest difficulty. They have achieved the vast feat of tolerating each other. We find the little surface faults of our friends, whom we only see every few days, or of our immediates, from whom we are separated many hours every day, hard enough to put up with. In fact, some of us spend large parts of the intervals in chafing about them.

But these arctic men are thrown together continuously and unbrokenly for many months and even years. There is no diluent, no separative, no human nitrogen; only each other to talk to and to hear talk; an all-day-long facing of each other's peculiarities.

It is reported that they finally lapse into entire silence. All honor to them that they do no worse. In a year after their return home they are even ready to start together again, to be once more held nose to nose for the slow and frozen months.

As, the higher up the scale of being men mount, the less do they resemble each other; so, by the same ascent, do the moments become more and more richly diverse.

As animals, men are more or less alike; they all eat, drink, sleep. Real diversity appears as soon as they begin to think, even quite commonplacely. When they reach a higher level, diversity is extremely marked. One likes painting, another music. Of two who like music, one likes one sort, another another. When, in the case of genius, they reach creative levels, the diversity becomes still greater. The music of Beethoven is wholly different from that of Wagner. When the really spiritual levels of consciousness have been reached, the gnostic, the noetic, then the diversity—despite identity of inner and ultimate essence—must be very great. Each man, standing as a god, must be a unique functioner in cosmos, needed by all the rest and by cosmos as one of its workers and creators, and needing all the rest. Not one can be omitted in the final perfection. There will be neither first nor last. The electrons are (possibly) monotonously similar; the atoms less so; the molecules less so again; crystals still less so; cells again less so. Always the lessening of monotonous similarity. At the highest, the unique and unressemblable spiritual man. Those who do not like the word spiritual, as defaced and blurred by misuse, may find another to suit themselves—running the line up from the primal unit through the units we call living—as if the rest were not!—through the plants, the animals, men of mind, to men transfigured in spirit. We must have a word for the paramental, as mental is our word for the human.

As with men, so with the moments. The animal looks about for "something to do," some employment for his animal nature. So with the human animal; it must somehow amuse itself, or the time is monotonous. The higher man has naught to do animally, and his mind is active in some onward direction. If his mind has not power enough to keep moving of itself, he may get the stimulus from a good book.

It must be possible, in the absence of this restless activity, in comparative mental quietude, to find another department of conscious-

ness, deeper, higher, in which no two moments no two hours, no two days, are alike; a department which may or may not color the feeling of the outer department. This inner pole touches the creative Soul of the universe and shares its life and nature. We can say very little about this, save that it must be a fact.

So the moments of the final god-man must be intensely full of an activity we cannot now understand, surpassingly vivid, no two alike. Our progress toward the power to live such lies in acquiring the power to dip into a stream of living consciousness running at this moment, and in all of us. We need the help of all other streams to find our own; and so the largest brotherhood, compassion, and toleration, is the first step in to our own natures.

Surely some of the toleration, at least, must have been acquired by the arctic bands by the time of their return to civilization. They have had a great opportunity. STUDENT

### The Libyan Desert Railroad

THE first section of the Libyan Desert railroad has been completed. The country immediately fringing the western bank of the Nile is bounded by the vast desert; but in the northeast corner of this desert there is a belt of extensive oases, Kharga, Dakhla, Farafra, and Baharia, sweeping round in the form of a crescent from the south. The soil here is rich and water plentiful, and the population numbers some 30,000 peaceful native farmers. Hitherto transport has only been effected with difficulty by camels across 80 miles of desert, the journey occupying five days, and sandstorms and drought prevailing.

The archaeological remains show that the oases were important trading centers under the Egyptians, Persians, Greeks, and Romans. Records show that they were inhabited as far back as 1500 B. C., but they declined with the decline of the Roman Empire.

Recent surveys have shown that besides the prospects in cotton, cereals, and other crops, the oases contain some rich mineral deposits. Though the rainfall is practically nil, prolific springs exist. So a London company obtained from the Egyptian Government a franchise to construct a railroad connecting the national trunk system at Farshut with Kharga, afterwards receiving additional facilities for continuing the track through the other oases, then crossing the desert again from the north of the Baharia oasis and linking again with the State railroad in the Fayûm.

The only difficulty of importance was the descent from the desert, a limestone plateau, into the Kharga oasis, involving a gradient of 1 in 40, which was surmounted, however. The track is single, narrow gauge, laid on creosoted timber cross-ties in the Nile Valley and oases, and on steel cross-ties in the desert.

The desert is an undulating limestone plateau, swept by sand and without a trace of vegetation or shelter. The chief difficulty along the line will be to maintain supplies and water from the base. The total length of the track from Farshut to Kharga is 122 miles, which takes five hours, of which three and a half are spent in crossing the desert.

The supplies of artesian water in the oases seem illimitable, the output of the existing wells in Dakhla and Kharga being estimated at 7 billion cubic feet a year. It is believed to be

derived from the rainy district of Darfur and the swamps of Bahr-el-Ghazal flowing northward through the porous Nubian sandstone. This water and the richness of the soil promise great future development, and a resuscitation of this ancient center of civilization. (Abstracted from *Scientific American Supplement*)

### The Race for Bankruptcy

THE British Secretary of the Admiralty recently told the House of Commons that he was "filled with despair at the dreadful rivalry which civilized peoples were inflicting upon themselves." Not only are warships growing more expensive, but they are becoming obsolete even more speedily. Notwithstanding which, they have to be more and more in numbers. And in a little while airships will be adding to the expenses. The life of a battleship is now little over fifteen years. Last year England sold for \$130,000 a battleship built fifteen years ago for \$4,000,000. During the last five years she has sold for a million a lot of ships which cost forty millions. But Nelson's flagship was forty years old when she fought at Trafalgar, and was in the line for years after that. She cost little more than what an obsolete ship now sells for as scrap iron.

All the other nations are in about the same case. How will it end? The limit of financial possibility is now well within sight. But what abject misery and poverty must some of the nations face before they admit that they have reached it! If the thing is not ended by a little wisdom, the grim law of catastrophe will take it in hand. Every evil contains in itself an appeal to that law, and finally the appeal becomes effective! STUDENT

### Clipped From the Press

THE Rev. Thomas J. Mulvey, a Roman Catholic priest, has resigned his assistant rectorship of St. Edward's Church, Brooklyn, and also from the priesthood. He has the following to say about the recent Papal anti-Modernist Encyclical. C.

I have no intention or desire to enter upon any kind of controversy or propaganda. My conclusions and my beliefs—or the lack of them—are my own affair. I only ask that they be respected. I am sure that a man's religious views or his change of them, should not, in this Twentieth century, interfere at all with his friendly relations with his fellow-men. The existence of a certain prejudice against a clergyman who resigns from the ministry which has lost its meaning for him can best be overcome by frankness and straightforwardness on his part.

In resigning from the Catholic priesthood I bear with me the cherished remembrance of happy and fruitful years of study and of work, as well as warm friendships, which I hope will never grow cold. I have no quarrel with the institution or those within it. If they find it necessary for their well-being, they are exercising the same privilege of religious liberty in adhering to it which I am exercising in withdrawing from it, and which an American public ungrudgingly accords us both.

"SHELLEY can only be called an atheist in so far as he maintained the inadequacy of hitherto received conceptions of the Deity, and indignantly rejected that Moloch of cruelty who is worshiped in the debased forms of Christianity. His clear and fearless utterances upon these points place him in the ranks of intellectual heroes."—John Addington Symonds

### The Ether Compressible?

"CHANGES in the Density of the Ether, and Some Optical Effects Produced by It," is the title of a paper read before the American Association for the Advancement of Science and briefly mentioned in its journal. This paper described experiments which afforded strong evidence in favor of the hypothesis that the ether is susceptible of changes in density and may be dilated in a glass vessel. It was also said that the ether passes slowly, and *not* freely, through glass; and that the dilation of the ether does not alter materially, if at all, the velocity of light waves, though it does reduce the amplitude or energy-carrying capacity of both long and short waves.

In the absence of details one cannot say much about this. The idea that ether is dilat-able (and therefore compressible) will not agree with the ideas of other physicists as to the nature of the ether. But it is no new thing for the ether thus to be loaded with mutually irreconcilable properties to suit the requirements of different theorists. Perhaps it is a mistake to suppose that there is only one kind of ether.

It is needless to point out that compressibility has so far been explicable only as a function of atomic structure; so that, if the ether is compressible, we shall have to suppose it atomic. Whence we arrive merely at a more tenuous kind of matter and are in need of another hypothetical substratum. In fact there must always be a hypothetical substratum; the known must ever have the unknown for a background; the ether is like a secret — when revealed it ceases to be such.

Science is handicapped in its speculations by limiting the resources of nature to that which can be grasped by (a) the physical senses, aided by instruments; (b) the imagination, based on the notions derived from the physical senses. Every hypothetical substratum has to have properties comprised within the above compass, and we are restricted to the extension, mass, and other notions involved in our sensory perceptions and our reflections thereon. But there are higher modes of consciousness, and, with them, higher modes of perception. Scientists have their attention so concentrated on one particular kind of objectivity that they are apt to forget that a very important part of our lives is spent in a world wherein there is no recognizable extension, mass, etc. One might ask, "What is a thought?" "What is an emotion?" Are these not also a part of the universe? The outer world of material objects may seem very real and solid; but the inner world of ideas counts for more in our life. Is there a substratum of thought — an ether of thought — an emotional ether? Is there a thought-electricity, a law of conservation of energy in the thought-world, and so on?

These questions may be thought fanciful, and as lying outside the sphere of science; but they must be considered if science is to form any adequate ideas about ulterior nature. The regions objective to the physical senses are limited, nor can the imagination, inspired by the gleanings of these senses alone, form conceptions adequate to explain ulterior phenomena. Behind the *phenomenal* world lies the *noumenal* world, as behind the senses lies the mind. Surely this is self-evident?

Science has gone too far along one track without going along the other; it has studied nature *objectively* and left out the *subjective* half of perception. For perception is surely made up of the two components, one within the mind, the other outside. We need to study human faculty. This was the method of ancient science, which studied nature within and without, regarding objects as being neither within nor without the mind, but as resulting from an interaction between that which is within and that which is without. Nor does Occidental religion know an iota more about either the inner world of being or thought, and the nature of the human constitution than science does. If one refuses to discuss the subject, the other claims exclusive possession of that domain — and knows absolutely nothing about it, nor is it even able to protect its frontiers. The reconciliation of Science and Religion must be sought where alone it is found — in Theosophy. STUDENT

### The Delphic Oracles

THE Oracles of Antiquity lie on the big, dusty shelf where lie so many things unexplainable, and therefore scientifically erroneous to our generation. The Oracles have gained the credit of obscurity in their utterances and rightly so. Universal law demands that in every case causes produce their due effects, or, in New Testament language, "what a man sows that he must also reap." This is obviously a serious bar to those who believe in foretelling events in definite language. For if a definite pronouncement is given, the mind naturally makes efforts for or against the result, or remains inert when action is demanded — in every such case interfering with the natural course of action, or natural law. But there seems to have been an exception in that the oracles were often delivered in such a way that a man of high intuition might perceive the truth and act as seemed best to him. Either it was considered that intuition had a right to special privilege (but not an unearned right), or that the best man deserved the most help from the gods. It is always the man who relies on the dead letter and not on his own conscience who fails to read the oracle aright. One fact is clearly recognized — that if by unfair knowledge the decrees of fate, karma, results of causes sown, are avoided, they are only delayed and not ameliorated. One wonders what would be said by the Delphian sage at the modern idea of denying away sickness and then expecting that it had really gone, instead of being merely pushed back on to a system of deferred payment, with interest?

King Croesus was definitely told this by the oracle when he complained that he had been deceived. "The god himself even cannot avoid the decree of fate." In the language of Theosophy, "None can escape the working of Karma," — the chain of cause and effect.

In addition, since he had been faithful to the oracle, it was explained that all that he had been told was perfectly correct; only he had misread it.

When contemplating war on the Persians he had sent to inquire of the oracle what the result would be. The reply was: "If Croesus should make war on the Persians, he would destroy a mighty empire." Believing this, since the oracle had never failed him, he went

to war, but was captured with his kingdom. Anxious to win, it had never occurred to him that the empire destroyed might be *his own*.

Symbolical language was also largely used by the oracles. There is the story of the brothers who came to learn who should inherit their distant kingdom. The oracular response that the one who first should kiss his mother should reign, was correctly understood by the one who pretended to fall and in so doing kissed his Mother, earth. At times the message was direct and clear. At others, entirely ambiguous, as the placing of a comma in either of two places would reverse the meaning of the sentence.

Some will doubtless think the idea of treating seriously of the Delphian and other ancient oracles is absurd in these enlightened times. But it is just such people who are quite willing to see the hand of "God" in the Urim and Thummim, and even in the strange maneuver of the Lord in sending lying prophets to lure Ahab to destruction (1 Kings xxii). Jesus the prophet is credited with a continual use of such symbolical language, and speaks in parables, the ambiguity of his statements about coming into his kingdom being no less deceptive to most than any of the oracles of Delphi. The calling in of Joseph to read the symbolism of Pharaoh's dream of the famine years, and of Daniel to read the "Mene, mene, tekel," are also evidences of a definite understanding throughout antiquity as to the manner and method of such oracular deliveries. It is begging the question to say that whatever the much-mutilated and much-edited Bible says is true, while the same kind of thing among other nations must be either fancy, myth, or the devil. The latter explanation possesses the boomerang property of flying two ways, since the Bible is by no means the religious textbook of the majority of the world, nor are its adherents numerically the largest body of sectarians. It is far better to try to discover just what significance such oracles had, and why they are not publicly known today, if, indeed, they exist at all in the West. Any light on a subject deeply engraved on the religious sense of the ancient world for ages and materially affecting the history of nations must of necessity be of interest to us. The one warning, however, applies to all these things, just as it does to Jesus Christ's teachings, and for that matter to Theosophy — that because fraud and misrepresentation for selfish purposes exist among degenerates, this is no reason to deny the purity of the original. P. A. M.

### Is the Ether Ever Visible?

SINCE the beginning of July a peculiar strong orange-yellow light — more orange in the lower parts and more yellow in the higher — has been observed during nights over the horizon throughout northern Europe and in the United States. Clouds or spiral streams of various tints were brilliantly outlined across the sky, so luminous that few stars could be seen. There were no traces of auroral bands or columns. A high barometric maximum was lying in the north, and the winds were from that direction during these nocturnal glows. There were also solar halos daily. The English astronomer Mr. Dennis says: "It is certain something in the air exercised the capacity of reflection in a very high degree. The period was one of great heat and thunderstorms." J.

# Art Music Literature and the Drama

## Japanese Ideals in Art and Life

THE world of art illustrates the truth of the Theosophical teaching that everything, when in activity, is governed by the principle of duality — "the world's eternal ways," the pairs of opposites; for in art we find this shown in the contrast between Realism and Idealism; and the perfect balance is never quite attained. The degree of Realism attributed by critics to the various schools or works of art arises from racial characteristics manifesting in cyclic periods. For instance, much of the earliest sculpture of ancient Egypt is intensely realistic, but as time passed certain conventional forms of deities, animals, and plants, were adopted to convey an inner meaning, and were handed on in stereotyped patterns with little change from age to age. This was an extreme case of deliberate and intelligent disregard of Realism, and as Egypt's cycle of greatness declined her art first became quite mechanical and then disappeared altogether.

Greece tried to combine the symbolical religious and philosophical meaning with perfection of outer form in sculpture and architecture. We say symbolism in architecture, for, although little is known or even suspected of this by the architectural authorities of the day, the traces of inner meaning are plainly visible to the student of symbolism who has the Theosophic key. Whether the "Pelagic" remains of Mykenae, the Doric of the Parthenon, or even the latest style, the Corinthian, be studied, evidences of the esoteric knowledge of those who designed them are apparent to the seeing eye; though in the later periods the creeping in of materialism and luxury largely disguised the primitive meanings. Greece rarely descended to vulgar realism in sculpture, though, if we may believe lay historians, Zeuxis and others perpetrated some *tours de force* in realistic painting! Let us hope (what is highly probable) that these accounts are greatly exaggerated.

In later Egypt we find individualistic realization reduced to a minimum. For instance, the portraits of the kings are treated in such a way as to make one feel that they are higher than ordinary humanity, abstractions of the idea of kingship, so to speak. You may be able to detect that a Rameses was of the thin-lipped, high-nosed type, or that a Thothmes had heavy features, but the small differences are merged in something greater and more impersonal. Even the famous Cleopatra had to submit to the same treatment, as we see by the relief at Denderah, which but faintly resembles the (probably authentic) portrait on the coins. It was not from incapacity that the Egyptians idealized their portraits as a rule, for a few are startlingly realistic.

For a complete contrast in feeling to this impersonal ideal turn to the portrait busts of the Roman Emperors, which touch the acme of personal resemblance and individualization.

In the civilization of the West the importance of the personal *ego* has been dwelt upon and encouraged; its art reflects this, and in

modern times this characteristic has increased. The growth of the tendency to realize the literal aspect of flesh and blood is easily seen by comparing the severe early Italian mosaics with the gorgeous *abandon* of Rubens or the scientific anatomical knowledge of Michelangelo. The discovery of photography has not tended to diminish this. In order to be perfectly fair in comparing the various styles of art we must admit that the really inspired individual artists of the divers schools have tried to bring down to earth something higher than mere sensual beauty, and it is there that the meaning of the

Lomaland Photo. and Engraving Dept.

A DAUGHTER OF DAI-NIPPON

much abused phrase, "art for art's sake," lies. But that does not affect the question of broad national ideals of art, to which the greatest have had to conform.

Now let us compare the general tendencies of Western civilization, derived from Rome, and Greece also, to a degree, with its accentuation of the personal, and those of the immortal East, in which the aim of the highest minds has been to sink the limited, petty egotism of the smaller impermanent self in the wider, diviner consciousness of the Whole, of the greater Self which overshadows the temporary incarnations, and which is the ideal Type to which man must conform or lose his immortal potentialities. The masses of the Oriental and Occidental peoples have naturally followed the tendencies of their respective ideals in art as well as in life.

In Japanese painting we see the Asiatic principle highly developed and associated with a most exquisite sense of beauty and high technical power of expression. Mr. Lawrence

Binyon, the eminent British Museum authority on Japanese art, recently read a paper before the Japan Society in London from which a few extracts will prove interesting.

After the awakening caused by the invasion of Buddhism from China, Japanese art separated into two principal schools, the Tosa —

with extraordinary dramatic power and rich color for its strength, and with a certain fixity of decorative convention and lack of power to express ideas for its weakness; the other, represented by the Chinese, Sesshiu, and Kano schools, inspired directly from abroad and almost entirely concerned with the classic themes of China, and, while singularly expressive, free, and apt in the suggestion of ideas, rather limited in subject and inadequately expressing the spirit of the national life. Each of these schools was in great measure the complement of the other. But, from the sixteenth century onwards, almost every original genius in painting represented an attempt to fuse the two elements into a complete type of art.

Flower painting assumed a far greater importance in Japan than it has ever done with us, where it is not universally considered one of the highest branches; but in Japan profound significance was attributed to certain flowers and to certain combinations of them. By means of these arrangements ideas of high import were delicately suggested to a people who have been sufficiently cultivated for centuries to appreciate subtleties and refinements which one fears are utterly invisible to the average European, even of the better class.

The art of arranging flowers has been carried in Japan to an extraordinary degree of perfection. It is a study in itself, and a favorite means of spending time at social entertainments. The second of the schools of art mentioned above represented flowers with a certain naturalness, "but always with a sort of religious sense springing from Buddhist thought, in which flowers were regarded as symbols, no less significant than human beings, of the infinite life."

The Japanese artist *suggests* the infinity of subtleties he wishes to draw your attention to, rather than imitates a few plain facts. This is the same general method which the wisest Japanese teachers have advised in the training of the young, and it is a very potent one. It is the method of the Tao.

By the careful avoidance of Western art methods in the treatment of the cast shadow and of what is technically called "modeling," i. e., the effort to represent things in their solid relief, the Japanese artists necessarily left themselves no possibility of realistic imitation in anything but line and color; and so we find that their art, largely divested of material basis, is eminently successful in presenting the soul of things. Every time Realism, in our sense of the word, was attempted by any school in Asia it failed, and we heartily support Mr. Binyon in saying:

As to the future, all would agree in hoping that Japanese artists would be true to their own traditions and not confuse their inherited ideal with Western ways and aims.

LOMALAND ART STUDENT

WALES has for several centuries lived a curious life of its own. For a long period in her history, English law permitted no Welsh-speaking man to hold any office or engage in any profession. These things were open to him when he dropped the language of his fathers, which he preferred not to do. The only honors to which he might aspire were therefore the native honors of bardhood. To write a successful poem, to show complete mastery of the intricacies of Welsh grammar and of the "twenty-four meters," these were the highest ambitions he might have. There was always the School of Bards to arrange the *Eisteddfodan* or song sessions, to judge the work of competitors, to award the chair and crown to the successful.

So this strange inner life of the people went on and on, almost unaffected by English commerce, politics and rule, entirely apart from and unknown to, the English at their borders and in their midst. All eyes and hearts were turned to the Welsh language and literature. The wandering bard was welcome at every farm or cottage, where at least one member of the household would be an aspirant to poetry himself. Curious as it may seem, a large proportion, perhaps three out of five, of the peasants could, and can still, tell the difference between good style and its absence in literature.

One result of this is that there is still a Welsh nation, unerasd by Anglicization, and now beginning to feel conscious of its divine mission in the world. Another result is, that there yet remains in Wales a great system of ethics and philosophy which is still almost unknown to foreign scholars and students. Possibly many of the books containing this system have never been translated into English. None of them have been satisfactorily criticised and examined. Some so-called critics have gone to them with the idea that nothing could be expected from such sources; others, with a view merely to documentary

proofs of antiquity. Before justice can be done them, they must be handled on their own literary and spiritual merit, with, let us say boldly and at once, the Theosophy that is in them for criterion.

At the present time, the middle and upper classes are turning towards nationalism in Wales, and cultivating more Welsh aspirations, language and literature. But it was not so a generation or two ago. Then, to call oneself Welsh meant almost to dub oneself a peasant, and consequently, to some extent, ostracism from society. There were some, however, who had courage enough for this; and their stand would always bring out a very beautiful side of Welsh character.

One such case was that of a gentleman who lived near Pontamman, in Caermarthenshire, in the middle of last century. He had land and works stretching up from the foot of the bridge towards the Black Mountain, and perhaps there was no one in the whole shire richer than he. That was in the days of the tin-plate trade, at which he had made his fortune. He was a Welshman by religion, politics, and sympathy, and never forgot to talk to the people in their own language. The Welsh have a penchant for litigation, indeed, a passion for it; but this man stamped out going to law in the Amman valley. The people brought their disputes to him and abided by his arbitration. He never enforced his decisions—he had no means of doing so—but they were always accepted. He was known far and wide as the "Peace-maker of the Valley," and his family was accounted more than half royal.

Then came commercial disaster for Wales; the tin-plate industry was ruined and with it the fortunes of the peace-maker. He died with his riches, and it is doubtful whether he knew that he died a poor man. The old house

## Wales

was sold, and the family migrated into England.

Years after a little boy, descended from this old man, was taken down to the village for a holiday. Looking at the old place day after day, with the "long, long thoughts" of boyhood in him, thrilled perhaps by some unexplainable uplift of patriotism, perhaps by love for the simple people who would come to their cottage doors as he passed, to bless and pet him for the grandson of their peace-maker—he one day declared that when he was grown up he would return and buy back the old home, and never desert them any more. They should, he intended, have another peace-maker then.

The childish saying was taken in earnest, and word went round the valley like magic, and up over the mountains. And because the Celt loves to throw a glamor of mystery over his doings, the peasants would come in, one by one, and wait about the garden where he used to play. They would hide behind trees and bushes till he passed, for the sake of giving him a penny or two, the richer ones more—they were all desperately poor. The gifts were all most proudly received, seeing the end that was in view. Old women would tramp ten miles over the mountains, with perhaps not more than a penny to give. There would be a hurried beckoning; a whispered, "To buy back"; perhaps a few tears and a blessing, and then, "hush! hush!" and they were gone. They were all desperately afraid of being found out.

One cannot but think that there was a quality shown there, innate in the race, which will have a great part to play in the upbuilding of that "new heaven and new earth" which Katherine Tingley's students believe will be established. There were big hearts in the old women and men who gave those pennies, even though the object of it all was merely sentimental. Katherine Tingley has been in Wales recently, and has spoken since of the fine

qualities she sensed as belonging to the people.

Imagine this ardent loyalty and devotion directed to the establishment of the Râja Yoga system in Wales. The Welsh have been crying out for education. They have found that the sectarian system now in vogue is not what they want. Intensely religious as they are, all the Welsh religious bodies have demanded a new and purely unsectarian system, and the conviction is growing that a plan must be found to make *real men and women* in the schools. They do not know as yet where to turn for the solution of their problem, but the time will come.

There is much that is of interest round about Pontamman. The tourists all go northward, but the South has its beauty spots too, with a quiet all their own. Over the mountains eastward is the Vale of Neath, the vale of many waterfalls, fairyland of Welsh tradition, the home of Gwyn ab Nudd, king of the nightly-dancing Children of Beauty. And this shire is Myrddin's country, Merlin the prophet's, who was Arthur's teacher. He had his magical hill outside the town of Caermarthen, with the Towy flowing by. On the Towy you will still see the ancient coracles of Wales, the leather boats of the ancient Britons.

Two of the rivers of this country stand pre-eminent in Welsh romance and mystic lore. According to Myrddin's prophecy, Cadwaladr was to return in after ages, with "the Eagle of the Towy and the Teifi," and the "Horns of Peace" were to sound the "Song of Joy and Serenity."

Higher up the stream stands the castle of Dynefawr, in Llandeilo parish, the chief royal seat of the princes of the south. Here lived Hywel the son of Rodri, called Hywel the Good, who united Wales in the Ninth century. It was he who revived and codified the laws of Dyfnwal Moelmud, earliest of Brythonic lawgivers. Hywel's laws do not provide for capital punishment. Here too, many centuries after, lived that great warrior Rhys ap Iorwystwl, who bore the standard of the Flaming Dragon at Bosworth Field, when Henry Tudor's Welsh army drove hunchbacked Richard from the English throne.

In this same parish, too, ill-fated Llewelyn, bravest and wisest of our princes, fought his last battle against Edward I; though he was not killed here, but in Shire Brecon, while sleeping and unarmed after the battle. Then there is Carrey Cennen, that beautiful grim little ruin perched on its immense rock high above the Cennen stream; with its memories of Rhys Ychwan, outlawed descendant of the then conquered princes—who three times took it from the Normans by assault, and three times lost it to them through treachery.

The Black Mountain rises between the Cennen and the Amman valleys—that Mynydd Amanw of the Mabinogion, over which Arthur and his men hunted Twrch Trwyth, the fierce prince of an elder age "whom God had changed into a wild boar for his sins." Right

through the valley and by the bridge they hunted him, and across Glamorgan till he took to the sea, where they won his treasure but he escaped with his life. On that mountain is the Llygad Llychwr, an impenetrable cave out of which the ice-cold Llychwr, already a river, as rivers are counted in Wales, pours itself singing:

On the bosom of the mountain  
There the Llychwr has her fountain.  
Dearest of the mountain's daughters,  
Oh, what songs go down her waters.  
In her mountain Welsh she's singing,  
With her Welsh the wilds are ringing.

So sings a local bard.

Then there is the Van Mountain, properly Fan Sirgaer, the high place of Caermarthen,

#### WINDMILL AT VISINGSÖ, SWEDEN

THE windmill represented in the cut, the only one of its kind on Visingsö, stands a mile south of Katherine Tingley's estate. It is not very old, but it is a good type of appropriate form into which windmills have been developed during generations under the special conditions of the North, and in consequence it is quite in harmony with nature. It gives an added charm to the exquisite scenery, standing as it does in the midst of fields where grow the crops that are ground by its stones. The slow turning of the four large wings, from sunrise to sunset, suggest many thoughts to a meditative mind. There is a power in this ancient symbol of life and it has its own significance as part of the landscape of Visingsö.

and the Van Lake reflecting it. The Three Physicians of Myddfai were able to cure every disease but three; they were the demi-gods of medicine in Welsh mythology. They learned their art from their mother, a daughter of the king of the lake. There were three fairies in the lake, and a young shepherd fell in love with one of them. She would live with him among mortals until he had struck her thrice, however lightly; then she must return to her own immortal kindred beneath the waters. The three strikings were given, not in anger but in remonstrance: the first when she sang merrily at a funeral; the second when she wept at a wedding; and the third for some kindred offense. On each occasion her action was caused, of course, by her knowledge of futurity and of the inwardness of events. Afterwards, however, she appeared to her three sons and taught them the mysteries of healing; but perhaps because of those three strikings, there were three things which no physician could ever heal.

The whole land is alive with strange memories and intuitions, with deep searchings after interior things. The *Eisteddfod* has now at last set itself to a determined effort to collect and write down the traditional music of the peasantry, and just before Katherine Tingley's visit to Wales, an influential committee was appointed by one of the Universities to explore the country thoroughly for archaeological remains, something that has never been attempted before.

The highest aspect of nationalism is when a nation is determined to give and do its best for the whole world. If the Welsh people, now so earnestly moving on the road to national regeneration, realize this, no failure will be possible, because this is not only compatible with Internationalism, but an absolutely indispensable part of it; and the International Era is the one which is dawning on us now.

KENNETH MORRIS

#### Jottings and Doings

(From a Student's Note Book)

THE month of August recorded the passing of two American women who will be remembered not only for their services to the literature of today but for their tender, compassionate interest in all that lives, struggles, suffers and sometimes fails—Katherine Prescott Wormely and Louise Chandler Moulton.

The former, who lived to the ripe age of seventy-nine, was a native of New England, as was also Mrs. Moulton, whom death did not venture to approach until she also had long passed the allotted "three score years and ten." Miss Wormely is best known to the English reading public through her scholarly translation of Balzac, comprising forty volumes and occupying fourteen years in the doing. Her humanitarian work, however, deserves not to be obscured by any other. When the Civil War broke out she was quietly living in Newport, a woman of thirty-one. At once she bent all her energies towards lessening the horrors of the war, became a member of the Sanitary Commission, served on the hospital transports and became superintendent of the nursing-work established in the Rhode Island War Hospital. Later she wrote a history of the work of the Sanitary Commission.

Mrs. Moulton, whose public literary work began when she was a girl of fourteen and continued until her death without lapse or any change save that of constant improvement, was often said by her friends to have "fallen in love with kindness." "Come and tell me about it, and let me see if I can help you" was always the spirit in which she received the appeals of the unfortunate, the needy, the young literary aspirant, the struggling writer. It was, above all, by her uniform and generous kindness to those in whom the selfish author would see only rivals, that Mrs. Moulton deserves to be remembered. Her fiction, her juvenile articles and her poetry were all of a high order, yet her supreme gift was a heart-gift of compassion, the pearl of great price.

# OUR YOUNG FOLK

Lomaland Photo. and Engraving Dept.

YOUNG STUDENTS OF THE ISIS CONSERVATORY OF MUSIC AND DRAMA, POINT LOMA,  
COSTUMED FOR ONE OF THE DANCES IN "MIDSUMMER NIGHT'S DREAM," AS PRESENTED BY KATHERINE TINGLEY IN 1907

## Harmony and Character-Building

**A**N ancient Greek poet once called the dance "silent poetry." The truth of this is felt by one who watches a group of young students moving to a stately measure through the mazes of one of the beautiful dances originated by Katherine Tingley in connexion with educational work in the Isis Conservatory of Music and Drama.

Not only do the movements of these dancers suggest the beauty and rhythm of poetry, but there is a certain delicacy and refinement about them, showing that these young people have been attuned to some higher, nobler purpose than that which inspires those who take part in the exercise of dancing merely because it is an amusement, and one of the social pleasures provided for young folks and children.

Plato taught and the Greeks believed, that training in music and gymnastic has a wonderful influence on the whole nature, refining the ruder elements and desires and bringing them under the control of the higher, and at the same time strengthening the higher and finer part of the nature, so that courage and high morality and physical strength and grace were all developed in a kind of harmony. This wise Greek knew that higher and lower could be thus harmonized, the one made the willing servant of the other, the higher being the rightful ruler; and that when there is this

## From "SONG FOR ST. CECILIA'S DAY"

John Dryden

**F**ROM harmony, from heavenly harmony  
This universal frame began;  
When Nature underneath a heap  
Of jarring atoms lay  
And could not heave her head,  
The tuneful voice was heard from high,  
Arise, ye more than dead.

Then cold and hot and moist and dry  
In order to their stations leap,  
And Music's power obey.  
From harmony, from heavenly harmony,  
This universal frame began:  
From harmony to harmony  
Through all the compass of the notes it ran,  
The diapason closing full in Man.

unity the nature is protected against enemies — the evil desires that work havoc when there is not harmony and self-control.

By music Plato meant much more than singing and playing on instruments. He meant also lofty teachings for the mind. Without these, physical exercise develops only the body. But when the mind has high ideals set before it, and, filled with pure and noble thoughts, then directs the body in rhythmical movements to the accompaniment of beautiful music, it

is easy to see that harmony will be produced.

This is the way it is with the training of the Râja Yogas. Here the dance has no element of frivolity; it offers no temptation to vanity, envy, or foolishness. It is a pure joy, strengthening and uplifting youthful hearts.

STUDENT

## A Sympathetic Soul

**L**AFCADIO HEARN, who wrote such interesting books about Japan, said that he would not like any of his family or any one else to cry at his funeral; they must be happy. He was intensely fond of Nature and loved trees. When a cedar tree was being cut down he said: "What cruelty! I feel as if my own arm were cut off." He would spend whole days watching the insects, and even worms and frogs were to him objects of intense interest. Of his dog he wrote:

She possesses a rude moral code — inculcating loyalty, submission, gentleness, gratitude, and maternal love; together with various minor rules of conduct — and this simple code she has always observed. By priests her state is termed a state of darkness of mind, because she cannot learn all that men should learn; but according to her light she has done well enough to merit some better condition in her next rebirth. So think the people who know her. When she dies they will give her a humble funeral, and have a sūtra recited on behalf of her spirit. E.

# THE CHILDREN'S HOUR

## The Serpents' Gift to Melampus

PERHAPS you have read in your story-books about some of the great Greek seers or prophets who could foretell events and thus warn the Greeks of danger. The first one of these was Melampus, and his wonderful gift of foreseeing what was going to happen came to him in a way that may interest you.

Near the house where he lived was a nest of serpents. The servants of the household killed the old ones though they were quite harmless, but Melampus managed to save the lives of the little ones. They loved Melampus and one day when he lay asleep under an oak tree they crept up to him and cleansed his ears with their tongues without waking him up. But he was never the same again, for after that he could understand the speech of all creeping things and even of birds.

Long after this when Melampus had been shut up in prison by his enemies, this helped him very much, in fact saved his life and the lives of many other people. In the night when all was still he heard the tiny worms in the woodwork of his prison-cell saying to one another that the wooden pillars were so nearly rotten that the whole building would soon tumble down. Melampus knew that no one else could hear what the worms said. He told his jailers about the danger. Perhaps they examined the pillars and found that they were worm-eaten; but at any rate they heeded the warning. Then they began to feel grateful to Melampus and decided to set him free.

The building fell, but no one was hurt, thanks to the warning. The people began to look upon Melampus as a prophet who could help and warn them and they paid him high honor. He was able to serve them by means of his gift until he died, and all his family after him were also prophets and could hear the speech of birds and of all creatures akin to the young serpents he had saved from death without a thought of anything but being merciful.

G.

## Sea Pansies

ALL the children of Lomaland know the pretty flower-like little animal called the sea-anemone. It grows down among the rocks and in the clear pebbly pools along the beach. There is another flower-like little creature native to Southern California. It lives, not among the rocks, but in the sand. It bears the pretty name of Sea Pansy.

In shape the sea pansy is like the flat water-lily leaf. It has a short pliant stem. By means of this, the little creature fastens itself to the sand so that the waves cannot wash it away. Sea pansies vary in size from half-an-inch to two inches across. Although it does not resemble a pansy in shape, one side, the face, is of a soft velvety purple color like a pansy.

If you look at the purple side closely (the other side is dull gray), you will see that it is covered with tiny round holes. Each one of these is the mouth of a very tiny little animal. The sea pansy, like our common gar-

## THE LITTLE PEOPLE

Madison J. Cawein

WHEN the lily nods in slumber,  
And the roses all are sleeping;  
When the night hangs deep and umber,  
And the stars their watch are keeping;—  
You may see the Little People,  
'Round and 'round the drowsy steeple  
Of a befringed hollyhock,—  
Clothed in phlox and four-o'clock,  
Gay of gown and pantaloons,—  
Dancing by the glimmering moon,  
Till the cock, the long-necked cock,  
Crows them they must vanish soon.

When the cobweb is a cradle  
For the dreaming dew to sleep in;  
And each blossom is a ladle  
That the perfumed rain lies deep in;  
When the gleaming fireflies scribble  
Darkness as with lines flame-tragic,  
And the night seems some dim albyl  
Speaking gold, or wording magic  
Silent-syllabled and golden;  
Capped with snapdragon and hooded  
With the sweet-pea, vague-beholden,  
You may see the Little People,  
Underneath the sleepy steeple  
Of a towering mullen-stalk  
Trip it over moss and rock  
To the owl's elvish tune  
And the tree-toad's gnome bassoon,  
Till the cock, the barnyard cock,  
Crows them they must vanish soon.

When the wind upon the water  
Seems a boat of ray and ripple,  
That some fairy moonbeam daughter  
Steers with sails that drift and dripplle;  
When the sound of grig and cricket,  
Ever singing, ever humming,  
Seems a goblin in the thicket  
On his elfish viol strumming;  
When the toadstool, coned and milky,  
Heaves a roof for snails to clamber;  
Thistledown and milkweed silky,  
With loose locks of jade and amber,  
You may see the Little People,  
Underneath the pixy steeple  
Of a domed mushroom, flock,  
Quaint in wildflower vest and frock,  
Whirling by the waning moon  
To the whippoorwill's weird tune,  
Till the cock, the far-off cock,  
Crows them they must vanish soon.—Selected

den daisy, is not a single growth, but a cluster of many tiny ones living together in a flower-shaped group. They belong to the same family of little animals as the coral builders, only instead of building a hard stony house, they make a soft one.

When you first take the sea pansies from their sandy home, you can see the little mouths open and close in breathing. If you take them very soon into a dark room, you will notice lovely flashes of red, yellow, and pale green light, passing from one tiny creature to another. This is their method of signalling one to the other that they are in danger or distress.

How wonderful is the One Life! Each tiniest spark of it builds a beautiful house to live in, and mirrors the Great Law. STUDENT

## A Dog Who Understood Brotherhood

DEAR CHILDREN: Would you like to know how the setter-dog Nancy practised brotherhood? I will tell you.

Nancy is a fine large hunting dog, of gentle, loving disposition, and devoted to all the members of the household to which she belongs. One day, Catherine, the little daughter, brought home three small kittens. Catherine is very fond of pets and her mother had said she might have some kittens, and so someone had given her these to take home.

The kittens having been taken away from their mother, missed her soft warm coat, and when night came they mewed piteously and wandered about the barn looking for her.

Nancy watched them for a while, a distressed look growing in her eyes; presently she went over to the kittens and began rubbing their backs gently with her nose; then, after she seemed to have gained their confidence (at first they were a little bit afraid of her), she lay down and drew them towards her one by one with her paws, until all were curled down comfortably against her warm body and shaggy coat; then she licked each one gently and carefully as their mother might have done, and they all snuggled down and went sound asleep.

Every night, and for a daily nap, Nancy made a bed of herself for the kittens until they were old enough to look out for themselves.

They grew so fond of their foster mother that they monopolized her for some time, and all through the long summer days she had to play and give her time to them. But after a while, when they had grown accustomed to their new home, and Nancy felt the need of exercise, she would stand up and shake herself gently and this would scatter the kittens and as they started to play with one another Nancy walked away and lived her own natural doggy life again until evening.

Surely that dog realized in her own way about "helping and sharing." Don't you think so?

AUNT HOPE

## Skylarks

SKYLARKS are among the sweetest of singing birds. They build their nests in the open fields on the ground. To the farmer they are sacred. He passes with his ploughshare around the spot where the small nest is placed. As soon as the pale gray light of dawn appears, the skylarks awaken. Up, up, up they wing their flight, singing jubilantly as they go. Even when they are so high in the heavens as to seem lost in the blue, their golden notes come pouring downwards like angels' music.

Although skylarks fly so high and sing so gloriously, they never forget their faithful mates at home with the tiny baby larks close to the ground. Each jubilant singer, when his song is over, darts like a swift-winged arrow back to his own sweet nest. Many beautiful poems have been written about this brave-hearted little "minstrel of the sky." AVIS

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis  
Vol. II treats of Anthropogenesis

THE SECRET DOCTRINE is the author's second great work, in which her profound spiritual knowledge and great attainments are stamped on every page. To be without this colossal monument of learning is a loss to any one, no matter what his aim in life. In this work, the

SECRET DOCTRINE OF THE AGES

# THE MYSTERIES OF THE HEART DOCTRINE

Prepared by  
**KATHERINE TINGLEY**  
AND HER PUPILS

*The Theosophical  
book of the  
Twentieth century*

Tells the story and the history of the  
Theosophical Movement.

The prices are \$2 in cloth and \$1.25 in  
paper, which barely cover the cost, for it is  
printed and bound, not gaudily, but with  
such carefulness and thoroughness of art  
and craft as to make it unique among  
modern edition books.

Order now from  
**THE THEOSOPHICAL PUBLISHING COMPANY**

## Evolution

THE word "Evolution" plays such a conspicuous part in the thought of today that later generations may perhaps believe that the people of our time worshiped a god of that name. It is of course an old idea and represents a conception that has always been familiar to the human mind; but it has of late acquired a special significance in connexion with scientific thought.

The word practically means the same as "growth." It is the unfoldment of something from within, the manifestation of something that was latent, the outward expression of an inner potency. Evolution implies that the thing which is being evolved was present before in a latent form.

Before the modern scientific spirit of inquiry became prevalent, people were content with the thought that the world was created and is maintained by Divine power. When scientists began to study the process, they discovered this law of growth everywhere manifest. Instead, however, of regarding this discovery as a partial revelation of the Divine workings, the religious people looked upon it as a challenge to their faith.

As if the fact that the universe grows and evolves were proof that it could not have been guided by Divine powers! Some scientists, however, are not guiltless of the desire to supplant the Divine Intelligence by erecting some other cause (?) in its place; and in so far as that which they were attempting to supplant was merely a narrow and illogical dogmatic conception, we can scarcely blame them. Nevertheless, of the *real* Divine power the law of unfoldment is merely a confirmation.

What really happened was that the scientists re-discovered Deity on such a grand scale that they did not recognize it again. They called the Power which they discovered a "law," a "force"—anything but the old discredited theological name.

The evolutionists gave us a (to our age) new and marvelous picture of the universe. They painted a vast array of countless forms of life all growing and changing throughout the ages, from times when the theological God was not born nor dreamt of. These life-forms all followed laws which knew no arbitrary decisions, no wavering and repentance, no petulant fits of anger, jealousy, and forgiveness, like the deity of narrow sects. To what could this unerring majesty of order be attributed? Not to such a God as that of the sects, clearly.

A Universe  
Greater than  
its "Creator"

So it was made the God of modern science and christened "Law" or "Evolution."

It was not long, however, before the scientists themselves began to clothe their new God with attributes conceived in the imagination, and to make him into a "graven image" with which to overawe unbelievers. The dogmatic tendency began to evolve from its hidden source in the human mind. The powers of this God had to be restricted within certain convenient limits, lest he should become too exacting.

Among other things it was said of this God that he was blind and indifferent, laying no obligations upon man and simply leaving man to get out of his way or dodge him as best man might.

The scientists had discovered a great eternal process at work in the universe; at first they were satisfied and did not look for a purpose. But nowadays, after the first enthusiasm of the re-discovery has worn off and we are beginning to realize that something more than scientific conceptions is needed to keep humanity on the track of progress, we are asking ourselves: "What is the Purpose behind this process?"

The notion of a vast eternal process going on without a purpose is unthinkable. And so must every prospect be which tries to find satisfaction for the mind in an external view of the universe. While false science tries to found itself on accepted unstable scientific dogmas, a true science would begin with realities, or at least with the most real thing we know of. The highest category we know of is *self-consciousness*—which we first find in ourselves. We can but predicate this as being the *ultimate* underlying fact in all life, human, animal, vegetable, or mineral. And the essence of self-consciousness is *Purpose*. Purpose, then, is the underlying fact of the universe; it is the cause of the processes we see at work. In our own life all production is the outcome of purpose; we conceive and then execute; so it must be in other realms of life—unless we prefer to believe in purposeless chaos, which exists nowhere.

As to the origin of man, if he came from the animals, then all his marvelous powers must either have existed latent in the animals, or have been introduced from some other source. We have to account for them somehow. No theory as to the evolution of man can contradict the actual observed results of that evolution. The fact remains that man is what he is, and the object of theories must be to account reasonably for that fact. The

Behind All  
Activity must  
lie Purpose

question is: Whence came the powers of man?

If we say that the powers of man were evolved from the lower kingdoms, then the unavoidable conclusion is that the Power that caused that evolution must be greater than what it has produced—that is, greater than man. But man is self-conscious, with all that that word implies; therefore the power that caused his evolution must be self-conscious at least, and more, divine, intelligent hierarchies.

Alongside of material science, studying the outer appearance of nature, we must also pursue another science, the science of mind and soul. This will explain the former. We have to seek the cause and fount of our own being, our own consciousness. We have to look within and try to follow up that consciousness to some larger source from which it proceeds.

We know of our mind as a field into which come all kinds of ideas, feelings, and experiences; but we do not know whence they come. We know of our life as being a small portion of a great life in which all share; but that great life we do not know. *Yet these things can be known.* To know them was the purpose of the great Wisdom of antiquity, *Jñāna Yoga*, the knowledge of Soul.

**A Universal** To know them would be to know the cause of evolution, **Life, of which** both in ourselves and in nature. **We are Part** Theosophy today teaches of them.

So, then, this universal application of the principle of evolution to science, to human history, to religion, must not be understood to imply any lapse into materialism. It means that we are realizing the universal presence of Law and Order—that is, of Purpose. Where there is growth there is life, and where there is life there is mind and conscious Purpose. Let us merely beware of the dogmas which are set up under the auspices of evolution, and study the thing in itself, accepting it as proof of the existence of conscious Life throughout the universe.

And, above all, let us remember that the same faculty in man which has made him what he is, can also make him what he is to be.

STUDENT

### Theory and Fact in Astronomy

IT was prior to the solidification of its crust, and while the surface was in a soft or fluid condition, that the Earth put on its present flattened shape, the flattening being due to a bulging out at the equator, caused by the Earth's rotation. The form of the Earth, moreover, is exactly that which any fluid mass would take under the same circumstances. M. Plateau has proved this by placing a mass of oil in a transparent liquid exactly of the same density as the oil. As long as the oil was at rest it took the form of a perfect sphere floating in the middle of the fluid, exactly as the Earth floats in space; but the moment a slow motion of rotation was given to the oil by means of a piece of wire forced through it, the spherical form was changed into a spheroidal one, like that of the Earth. (*Elementary Lessons in Astronomy*, Lockyer, 1899)

The confidence with which the above is put forward, without qualification, is likely to be misleading to the student. There are two separate questions mixed up: (1) Does rotation produce polar compression in a fluid sphere? (2) Is the polar compression of the earth quantitatively what it ought to be according

to the dynamical theory? The first may be conceded; but the second has been the subject of numerous mathematical calculations, yielding diverse results; in fact it is stated that the correct solution of the problem requires that we shall first know what the shape of the earth is—the very problem we are seeking to discover.

But be this as it may, the question of the other planets invalidates the whole argument. Is the polar compression in their cases what it ought to be? And on this point we find the following in the text-book above quoted:

As in the case of the Earth, we find in many instances the axis of rotation, or polar diameter, of the other planets shorter than the equatorial diameter. The amount of polar compression—that is, the amount of flattening, by which the polar diameter is less than the equatorial one—measured in fractions of the latter, is as follows:

Mercury	1/29	Jupiter	1/17
Venus	1/303	Saturn	1/9
Earth	1/299	Uranus	?
Mars	?	Neptune	?

From this table we learn that if the equatorial diameter of Mercury be taken as 29, the polar one is only 28; in the cases of Jupiter and Saturn, the diameters are as 17 to 16, and 9 to 8, respectively. In these two last the rotation is very rapid; and this great flattening is what we should expect from the reasoning in Art. 196.

Assuming for the moment, what seems to be implied in the above, that the amount of compression depends upon the angular velocity only, we find that even so the facts do not bear out the theory. For Jupiter's angular velocity is given in the tables as greater than Saturn's, wherefore his compression ought to be greater; but it is less. And Mercury's angular velocity is given as nearly the same as those of Venus and the Earth; yet its compression is greatly more.

But the fact is that the compression does not depend upon the angular velocity alone, but on functions of this velocity and of the radius. This circumstance is not stated in the quotation given. If it had been, it would have upset the calculations still more. For Mercury's *moment* is very much less than that of Jupiter, in consequence of his radius being only 1/30; and therefore his compression ought to be much less. But it is only slightly less, not nearly so much less as are the compressions of Venus and the Earth, which have greater moments than Mercury.

To be brief, this desire to account for the polar compression of planets by attributing it to the above-mentioned dynamical principles alone is not borne out by the data and constants tabulated by astronomers themselves; a circumstance which, one cannot but think, has not been sufficiently brought out in the text-book referred to. The writer has stated the theory and described an experiment with a rotating hoop and another with a drop of oil; and, in extending the theory to the case of the other planets, he gives figures which contradict him; failing, however, to point out the contradictions.

The student will find in *The Secret Doctrine*, by H. P. Blavatsky, other instances of scientific generalizations which are contradicted by scientific facts. As Theosophists are truly anxious to recognize the merits of science, it is only right, both from the Theosophical and the scientific point of view, that what is sound

should be separated from what is not. If it be replied that the most representative men of science know better as to these astronomical points, one must ask in return: "Why are such statements made in school text-books?"

STUDENT

### Antarctic Exploration: Lemuria

THE Australian Government voted \$25,000 and that of New Zealand \$5000, towards the Antarctic expedition under Captain Shackleton, and proposed that the professor of geology in Sydney University, with two students, should accompany it. The steam whaler *Endeavour* was to leave Lyttleton, N. Z., on the first day of this year; and after landing stores and all requirements for a year's stay on King Edward VII Land, return to New Zealand. Captain Shackleton was a member of the Scott expedition of 1901-4, which reached 82° 17' S., and 163 W.

The distance of the proposed winter quarters from the South Pole is about 730 miles, of which about 270 (as the crow flies) have already been traversed. An automobile will draw a train of sledges for the 270 miles, after which will be employed a dozen Manchurian ponies.

In the Scott expedition, ranges of high mountains were found in Victoria Land, about 82° S., and from 10,000 to 12,000 feet in height. The coast line was traced due south to 83° 20'. Most of the traveling was done on the great ice-sheet floating on the sea-front, which was found to extend 100 miles from east to west and 270 from north to south, with a surface so level that at its outer part no change could be detected by the aneroid. Further toward the shore, however, were the usual hummocks and peaks, caused by icebergs and pack-ice, which form such an obstacle to polar travel. The main object of the scientific part of the expedition is to gather meteorological information such as is much needed in Australia and New Zealand on account of its bearings on the climate of those countries.

A subsidiary expedition visits the Auckland and Campbell Islands, which belong to New Zealand. It will try to define the relations of Australasia to Australia and New Zealand on the one hand and to South America on the other, and to collect evidence regarding the former great southern continent which Sclater called "Lemuria," which has been discussed by Russel Wallace and other men of science, and which was the home of the Third Root-Race of humanity. (From particulars in the *Scientific American*.)

In connexion with this last remark it should be noted that the ancient teachings outlined in H. P. Blavatsky's work, *The Secret Doctrine*, give a definite place and meaning to the discoveries of geologists and archaeologists by showing their relation to the other factors in the vast scheme of race evolution; and that future discoveries, like past ones, can only confirm those teachings and oblige scientific men to adopt them. The duty of assigning credit to the Teacher who first proclaimed them may be left to a future generation, even as today we do tardy honor to great names, now that the gulf of time has swallowed up the envy that denied them the recognition of their contemporaries.

# Some Views on XXth Century Problems

## The Night's Rest

**A**MID all the prescriptions and panaceas for living a long time, one never sees mention of the simplest of all, and the most thorough and effective—the taking of a night's rest. To get this, so as to rise every morning new born, requires practice and the exercise of will. But it is possible to prepare all day for the night, and all night for the day.

We live all day at more or less pressure, driving from one thing to another, or from one thing to more of the same thing. Business is interrupted by the necessity to eat; but in some of the restaurants of great cities the tables are supplied with telephones.

So all day long we are flinging energy into the thinking brain. Business may be carried on till bedtime; the evening may be spent in study; some people do entirely relax and recreate. But even for that last, much more for the others, the brain runs on till the very last moment of waking consciousness. No one has any theory or idea that that is wrong and exhausting. The brain, knowing no better, having never been taught any better, goes on through sleep in a broken and incoherent way with its stream of ideas and pictures. Some of these are vivid enough to be remembered; these remembered dreams we think to be the only dreams there are. If more vivid than this they may be painful. If still more vivid they may break up sleep. And, to speak paradoxically, if still more vivid yet, they may prevent sleep altogether.

But its proper function during sleep is to build up its cells, to absorb energy from somewhere for the next day's work. By the law of its being, by the cosmic law of rhythm and regeneration, it would do that perfectly if we would untrain it from the wrong training we have given it. We know that if we have not eaten for some hours before bedtime, the stomach is able to finish up the labor of digestion and get to rest. Its rest also, is building. But if we have eaten at bedtime the vital force must work at digestion instead of construction, and the digestion of the next day is weak and in need of stimulants.

To withdraw from the brain is therefore the secret of its health. And considering the multiplicity of its connexions with the whole body, this is obviously one of the most important secrets of our total health.

Some have found that by a few minutes of muscular exercise at bedtime they can accomplish this. The practice may be very beneficial, but it is very partial. For it leaves consciousness still in vivid relation with the external run of things and with the body as a whole. Surely there is something more and other to do. For complete rest, consciousness must be gathered in from the external. And just here we come upon the fact that materialism and perfect physical health are incompatible. The materialist cannot take the last step.

Every human consciousness, as sleep deepens, seeks its Source, the inner Soul of the world, the ultimate life. But this, in our over-brained civilization, is difficult, oscilla-

tory, uncertain. The continuing pulse of the brain action holds consciousness back, uses some of its essence. The personal soul has accustomed itself to find in brain work its chiefest life.

So the final step, before sleep, is to try to do voluntarily and consciously what will be done or attempted by imperishable instinct a little later; to let the last minutes be occupied in the attempt to reach inward and upward to the Divine; to harmonize consciousness to its highest. After a very little practice it will be found that the waking next day becomes a wholly different matter. Not only has rest begun to near perfection, but the brain is refining itself and preparing the power to respond to much higher reaches of thought and conception. Each day will be a real new beginning, a new rejuvenation, not a mere continuation of yesterday. He who persists in this need have no fear that old age will bring senility.

## Soul, Sin, and Self

**“W**HAT do they mean by soul?” asks a religious paper, criticising the Theosophists' criticism of the revivalist “soul salvation” teachings.

The critic will have to look into himself for the answer; for the Theosophical psychology rests on those facts of human nature which any man may find out for himself by looking into himself.

He will find *mind*, whose very being is in movement and change. It may be partly or wholly within or out of control; much or little given to emotion; may have tastes and inclinations of any kind, and may vary in them from hour to hour and from year to year. It is affected by age, health, pleasure, pain, by every bodily movement, by alcohol, coffee, tobacco; and by every impression coming in upon it through the senses. Its stream of activities ceases not for one second of the waking hours.

But the man had to begin with himself, nevertheless, and is conscious of himself through it all. Behind all the mental changes is I, self, soul, as unchanged in itself—yet as changeably hidden and revealed—as the moon by the swift clouds. Its—his—consciousness is much more than mere I-ness, *How* much more, and in what way more, mind—its instrument—will never fully know. Man must stop supposing that brain knowledge is the only knowledge possible to him. Mind is a living and very conscious machine; but with all its vivid intelligence it can never know all that its operator knows.

Yet it can know very much more than it now knows. This increase comes about when, and in proportion as, the I takes dominant possession of the field, as the moon learns to pattern and color and guide the clouds as it will.

Man is already conscious of a number of possessions that he did not get from the mind, that are his very own. Sense of duty, for instance, and conscience, and compassion, and all *realizations* of truth as distinct from mere

speculation and assent—are immediate work of the I, the soul.

The sustaining energy of mind comes from the soul, that energy that permits it to be more than a mere reactor to environment like an ape or an idiot. This is centrifugal. To call it back into the soul in meditation, would mean the acquirement of self-knowledge. After that, the mind receiving it back again, would never again break loose from control, never run away with or prostitute its derived life. During that time of inner self-withdrawal, which may afterwards be repeated with ever less difficulty, the soul can as it were breathe freely and re-enter into communion with its Source, the “Father in Heaven.” It can so get perfect refreshment. This Source, the brain working alone cannot understand. Any concrete conceptions it may make unilluminated by union with the soul, must be faulty in proportion to their concreteness and definition. Hence the perniciousness of theological dogma.

The soul comes into the world of matter like the laborer into the vineyard.

It has to make for itself a mind appropriate to that world and to the co-presence of its fellows, recovering its self-knowledge against the resistance of, and finally by aid of, the mind. It enters the world a soul and finally becomes a mind-soul, ready for creative work. For this evolution many lives are necessary—but no more their concrete memories in daily consciousness than the memory of his early technical exercises to the finished pianist. Still, these memories *are* deeply present.

This possibility of self-knowledge is the origin of the idea of “conversion.” It may come suddenly, but is never “the free gift of God,” only the crown of long effort of this or former lives. No one knows how much of this effort may stand to his credit in his inner nature, outwardly forgotten and overlaid. We have lived through many civilizations, in many nations. Man may tread the path a little way and then be beguiled far afield, only long after returning to the point he left.

“Conviction of sin” is not the illumination, which is rather conviction of *divineness* and of the possession of a divine birthright and power.

## The Collapse of Reason

**M**R. Balfour's argument—apparently for human divinity—at the Pan-Anglican Congress, was almost too neat to be effective.

Nature is a field of struggle for survival. Consequently qualities fitted to ensure survival have been evolved by natural selection, any others that showed up being promptly wiped out. Reason has been evolved as a faculty whose sole purpose is to help the survival of its possessor, and is only valid in so working. All the work of reason not thus concerned is therefore invalid, including scientific speculation and theory, *and this very argument itself!* As no scientific man will (presumably) go that far he seems to yield the case. ## Steps at Mihintale

"EIGHT miles to the east of the sacred part of the city of Anurādhapura, the rocky mountain now called Mihintale rises abruptly from the plain to a height of 1000 feet. Its slopes are now covered with dense forest from the base almost to the summit, with the exception of the space occupied by a grand stairway of granite slabs which lead from the level plain to the highest peak. These steps, one thousand eight hundred and forty in number, render easy an ascent which must have been originally very toilsome." (*The Ruined Cities of Ceylon.*)

According to the *Mahāvamsa*, it was on this mountain that the royal apostle Mahinda met King Devānāmpiya Tissa, who was out hunting, and there and then converted the monarch and his large retinue to the tenets of Buddhism. Near the summit of the mountain, a dagoba (the Ambustele Dāgoba) marks the scene of this memorable interview, and is said to contain Mahinda's ashes.

The granite stairway is still in good preservation, but the steps show the wear caused by the bare feet and knees of the millions of pilgrims who have climbed to the shrine above. B.

## The Goose-Tree

A WRITER in *The Scotsman* says:

"The legend of the barnacle being the origin of the barnacle goose, . . . recalls the other fable that these birds were produced from the fruits of trees—a legend which was comparatively common, and is to be found in various forms in works of an early period. Aldrovandus even gives a woodcut of the tree which bore the geese, representing it with leaves like those of the myrtle, and bearing fruit, which, when it fell into the water, produced the geese, four of which are shown in the woodcut swimming beneath the branches of the tree. Another who described the tree was Münster, who in his *Cosmographie* said that in Scotland 'are found trees which produce fruit rolled up in leaves, and this, in due time, falling into water, which it overhangs, is converted into a living bird, and hence the tree is called the goose-tree. The same tree grows in the island of Pomona. Lest you should imagine that this is a fiction devised by modern writers, I may mention that all cosmographers, particularly Saxo Grammaticus, take notice of this tree.' Boëce has a slightly different version, in which he criticises the belief that the geese grew upon the trees, hanging by their bills, and says, 'Because . . . saw oft-times the fruit that fell off the trees converted within a short time into geese, they believed that yir-geese grew upon the trees, hanging by their

nebbis such like as apples and other fruits hang by their stalks, but this opinion is nought to be sustained. For as soon as their apples or fruit falls off the tree into the sea-flood, they grow first worm-eaten, and by short process of time are altered into geese.' Another old writer says that the trees resembled willows, 'as those who had seen them in Ireland and Scotland' had informed him. Caspar Bauhin tells also, that 'if the leaves of the tree fall upon the land they become birds, if on the water, fishes.' Pope Pius II, in a work which appeared about the end of the fifteenth century, speaks of a tree which grew on the banks of a river in Scotland which produced fruits resembling ducks; if these fell on the land they perished immediately; if on the water they became ducks, feathers appeared, and they flew off. He says he had not obtained any proof of this tree in Scotland, but that it was to be found in growth in the Orkneys."

The persistence of stories like these is sufficiently hard to account for by conventional theories, especially when, as is so often found to be

ern culture of which relics are found in Scandinavia; and in the Finnish epic *Kalevala* and in the *Eddas* will be found similar references to birds, water, trees, etc., in connexion with cosmological symbology.

Under these circumstances it seems clear that the legends given above are relics of this ancient symbology; just as those familiar fairy-tales, which Andrew Lang has shown to be the common property of all mankind, are remote descendants of orally repeated allegories. To what extent such allegories become translated in the minds of the ignorant into literal accounts is a complex question. The world is moving very rapidly at this present turning-point in the cycles, and it is only a matter of time before the belief that these legends were the follies of "primitive man" will be ousted by the discovery that they are the shattered relics of ancient science—that science which used the marvelous symbology of the zodiac for one of its keys. In the world's sacred scriptures we find the ancestors of many of these symbolical legends. STUDENT

the case, they are not European merely, but world-wide. It might require some research to trace the analogues of this particular legend among other races; but, as to bird-symbolism in general, we find it everywhere—as well among the remnants of America's old races as among the peoples of the Old World.

The following quotation from *The Secret Doctrine*, by H. P. Blavatsky, may elucidate the question.

"The symbol of Hansa (whether 'I,' 'He,' Goose or Swan) is an important symbol, representing for instance Divine Wisdom, Wisdom in darkness beyond the reach of men. For all exoteric purposes, Hansa, as every Hindū knows, is a fabulous bird, which, when given milk mixed with water for its food (in the allegory) separated the two, drinking the milk and leaving the water. . . . That this allegory is very ancient and dates from the very earliest archaic period, is shown by the mention (in *Bhāgavata Purāna*) of a certain caste named 'Hansa' or 'Hansa.'"

Later she speaks of—

"The choice by the Rose-croix of the aquatic fowl—whether swan or pelican—with seven young ones, for a symbol, modified and adapted to the religion of every country. En-Soph is called the 'Fiery Soul of the Pelican' in the *Book of Numbers.*"

With the sacred birds of symbology are also associated aquatic plants, such as the lotus associated with the ibis in Egypt. Much of our north European symbology dates back to the days of that ancient North-

## The Dilemma of Physiology

**M**ECHANICAL physiologists have long recognized that from the direction of psychology impends some danger to the doctrine of the conservation of energy. Mechanical physiology and psychology, which are much the same thing, rest on this broad postulate:

The body is a temporary storehouse of a certain amount of physical force. This flows in as food, sunlight and so on; and after a while flows out again as heat, muscular motion, and the smaller motions of cells; all of it finally returning to nature. If we could measure all the physical force that went in against all that finally came out, the two sums would be equal. Consciousness, though it is attendant upon the processes of entry and emergence, has no active share. We could in imagination endow a pistol with consciousness, suppose it aware of being loaded, aware of the force that had entered it in the powder, conscious of the movements of the molecules of the powder, conscious of the pressure of the finger on the trigger and the discharge of all the force in the explosion; but as a conscious being in no way itself active.

The sense stimuli are the finger on the trigger of the bodily pistol.

Professor Wenley in the *Popular Science Monthly*, quotes some sentences of Professor Cattell's, which, though spoken twenty years ago, deal with a still very lively problem:

Much is being written just now regarding the relation of consciousness to the brain. The question is: Do perceptions, thoughts, feelings, volitions, stand in causal relation with the brain, or are they an epiphenomenon, accompanying changes in the brain but not influencing them? Are our ordinary actions complex reflexes due to physical stimuli and the structure of the nervous system, or are the changes in the brain that precede movements initiated and directed by consciousness?

The two greatest scientific generalizations of the present century are the conservation of energy, and evolution by the survival of the fit. Now, if consciousness alters, however slightly, the position of the molecules in the brain, the fundamental concept of physical science must be abandoned.

Because consciousness will—so goes the argument—have in that case *originated* the force necessary to alter the molecule; that is, will have contributed to the sum total of physical force. But further:

If consciousness have no concern in the actions of the individual we have one of the most complex results of evolution developed apart from the survival of useful variations, and the Darwinian theory has failed.

That is, either consciousness is operative upon matter, or it is not. If it is not, how came so useless an acquirement, and so complex, to be evolved? For the very essence of Darwinism is the evolution of the useful only, the elimination of the useless. If it is, then how did it get the force with which it operates upon the molecules and cells?

The mechanical physiologico-psychologists usually leave the Darwin aspect of the difficulty alone and deny to consciousness any action in the chain. Life is wholly automatic,

the reception of force, its temporary storage, its release by sense-stimuli. But their theories can only live like hothouse plants, carefully guarded from the east winds of fact, fact known to every mortal.

The writer once saw a schoolboy moistening a large sheet of paper with his tongue. He explained that he got so much saliva by thinking of a lemon. In other words he, the conscious ego, willed to call up in his consciousness the subjective picture of a lemon; and this act of will finally came down to the cells of his salivary glands, to their blood-vessels, and to the muscles lining the salivary ducts. That boy, and all humanity, know in their own way that consciousness *can* act on the forces of matter.

The question raised by Professor Cattell then comes up in its subtlest form. So many thousand foot-tons of force are put into a twelve-inch gun when it is loaded. Exactly that many reappear when it is discharged. The man who fired it effected that reapparance by his half-ounce pressure on an electric button, and by turning a handle determined the point of the compass to which the shot should go. No one supposes that a man's consciousness creates the force that appears in muscular motion; it merely guides it as to what special motion there shall be. But in effecting that guidance has it to furnish from itself some trifle of force? The salivary glands contain much stored force. But could that be liberated without the touch, as it were, by consciousness of an electric button, a touch involving the expenditure of at any rate a *little* force from within itself? If not, then by that much the store of force on earth has been augmented and the doctrine of the conservation of energy is not quite true. If it could, then something goes on at the layer of junction between consciousness and matter of which we cannot yet form any conception. And that is probably the case. It is only an altogether new power of looking within that can solve the problem. This only can pass the blank walls that everywhere surround purely objective science. STUDENT

## Nuclei

**T**HAT the essential life of a cell resides in its nucleus, has hitherto fallen short of being an aphorism in biology only because there remained some few cells known to us which seemed devoid of that structure. Bacteria, for example, and red blood cells, were thought to have no nucleus. But by the application of certain reagents in which nuclei are insoluble, but which dissolve the cell body, it has been found that these organisms are nuclei pure and simple, naked, practically with no cell body. Research may be said to have made the aphorism valid. For though in some organisms the nucleus disappears for a time, it must reappear if the organism is to live. And non-nucleated fragments of cells, though capable of exhibiting some of the phenomena of life for a few weeks, cannot maintain themselves beyond that period.

The point is more important than it seems

at first sight. For it marks an absolute gap between the organic, even in the lowest organic forms, and the inorganic. The cell body can be very closely imitated in its behavior by various artificial compounds, even by globules of emulsion of oil and water. There are various semi-active colloids which may be regarded as occupying a mid-station between inorganic matter and the matter of the *body* of cells. But the nucleus, in all its complexity and with all its powers, suddenly appears, dropped as it were from heaven into the inorganic sea.

The powers are, the nutritional guidance of the cell, and causation and supervision of the cell's growth and multiplication.

The nucleus is, in the terminology of a French chemist, a "thermo-catalyst," a body capable of bringing about combinations under widely different conditions of temperature and pressure to those in which they would naturally occur.

A temperature of 5400 F. is, he points out, necessary for the spontaneous combination of *pure* carbon and oxygen. In the presence of the nuclei of cells it is effected at a temperature of 100 F. The same chemist thinks that

to every chemical compound corresponds an elementary organism, which may or may not be realizable under appropriate conditions of pressure and temperature, and which contains this compound in small but definite proportion,

having abnormally caused the union of these foreign molecules with its own.

A living unit might therefore be defined as a *nucleus*, with or without a surrounding body, possessing the power of mediating combinations which would otherwise not take place at all or only under widely different conditions. The real "missing link" is between the inorganic and the nuclear. Whenever a nucleus appears, it is because a previous nucleus was there to furnish its germ. The steps of evolution of the nucleus, if there are steps, are absolutely unknown. The newspaper talk about this or that "daring" experimenter having "created life" or taken a single step toward it, is—newspaper talk, whether the voice be that of the experimenter or of an inspired reporter.

The more we know about the nucleus the more complex it becomes. At first it was thought to be a structureless speck. Then it turned out to be a packed skein of worsted which occasionally unraveled itself into a clear ring. Then the skein turned out to be made of minute lengths placed end to end, a definite number for each species of plant or animal. Then these lengths, capable of a good deal of independent life of their own, showed that they contained or were composed of dots, also with independent life. And so on. It is already suspected that the dots are granular, that is, composed of still minuter units. There is no evidence that we are near the end, nor any nearer the unvitalized inorganic.

According to a speculation of Mr. Butler Burke's, the first thing, not the last, to appear, was the vital unit, a plasm soul. STUDENT

## A FOREST DWELLER

BLUE MOUNTAINS, N. S. W., AUSTRALIA

### Forgotten Burbanks of the Past

THE cultivation of fruits seems to be an old art which we are just beginning to rediscover. A writer points out that the apple, pear and plum were brought to England by the Romans, and that the Romans had a species of coreless apple called *spadonium*. The name of the cherry occurs in Anglo-Saxon vocabularies. But, he asks, how many new fruits have we discovered? The fruits which we eat are mostly "wildlings still," and but little has been done to improve them. Even the tropical fruits owe nothing to our science. Who did the work? No man knows, but it was not Europeans.

In short it seems that someone in the past has transformed wild fruits into cultivated varieties which we have continued to use, taking them as fixed types and never thinking of creating any new fruits for ourselves. After all, the ancients had the plants and the soil and plenty of brains and plenty of time. Perhaps they will incarnate again soon and help the world along another stage. E.

### Martinique and St. Vincent After the Eruptions

THE recent visit of Dr. Hovey, the geologist who was sent with relief to Martinique in 1902 at the time of the eruption of Mt. Pelée, to the scene of his former labors, has resulted in finding that the region is recovering from its awful catastrophe. Mt. Pelée was still pouring out steam from hundreds of vents near the top and great changes had taken place in the contour of its cone since 1902. But on the east side of the

mountain sugar was again growing, the ash doubtless acting as a good fertilizer; and a French market had been found for the product. On the west side, however, more directly in the track of the deposits, the devastated area had not yet been recultivated. St. Pierre was, with the exception of the main street kept open for the sugar traffic, overgrown.

On St. Vincent, La Soufrière was quiet and vegetation was creeping up towards the top. Though the mud deposits on the westward side had interfered with replanting of the ruined estates, on the east the crops were growing again, and the island could be described as more prosperous than before the catastrophe. T.

### How Do Animals Find Their Way?

A PET dog, left in Columbus, in Ohio, found its way to Chicago, more than 300 miles distant, whither its owner had removed. It not only performed the journey, but singled out its mistress from among more than two million people.

Such stories are common, not only of dogs but of other animals. Here then is one of those gaps in scientific knowledge which are so often forgotten when the prowess of science

is in question.

Evidently there exists a faculty able to accomplish these results, and it is not likely that a faculty enjoyed by animals is out of the reach of man. In animals certain faculties are more keenly developed than in man, be-

## THOUGHTS REFINED IN NATURE'S BOWER

KEATS

**O SOLITUDE!** if I must with thee dwell,  
Let it not be among the jumbled heap  
Of murky buildings: climb with me the steep,—  
Nature's Observatory—whence the dell,  
In flowery slopes, its river's crystal swell,  
May seem a span; let me thy vigils keep  
'Mongst boughs pavilion'd, where the deer's swift leap  
Startles the wild bee from the foxglove bell.  
But though I'll gladly trace these scenes with thee,  
Yet the sweet converse of an innocent mind,  
Whose words are images of thoughts refined,  
Is my soul's pleasure; and it sure must be  
Almost the highest bliss of humankind,  
When to thy haunts two kindred spirits flee.

cause man does not need them in such a degree, partly from his different habits and partly from his possession of a reasoning mind. This faculty is one of them; in man it is weak from disuse, but he could develop it; his reason would, however, tend to interfere with the instinct. An idiot would be more likely to succeed.

In reflecting on the nature of this faculty,

Lomaland Photo. and Engraving Dept.

## "THIS IS THE FOREST PRIMEVAL"

BLUE MOUNTAINS, N. S. W., AUSTRALIA

we should remember that we really know very little about the ordinary faculties. How do we see distant objects, for instance? First we have to postulate an ether to convey the light; then a picture is thrown on some nerves at the back of the eye, which nerves are continued into the brain. But how the mind operates in receiving its impression, we cannot conceive; nor does there seem any obvious reason why the mind should need the bodily mechanism at all, and why it cannot read a picture on the wall as easily as one on the retina.

Since, therefore, the mind can do such wonderful things within the brain, there seems no valid reason for the assumption that it cannot do similar things outside the brain. We know so little of the powers of mind and how it puts itself in contact with matter. Mere distance cannot count for much; are there not spaces between the atoms? The animal's mind, traversing space (or avoiding it), perceives its distant object. All we need do is postulate another ether, or the same ether, and a new sense.

Finally let us always remember that it is unwise to dogmatize as to the possibilities of nature when we cannot really explain even her most familiar doings. Nature is a boundless potency whose fertility it seems impossible to exhaust. It is we who set the barriers by our doubts and feebleness of will. Prodigies in calculating, memorizing, or music, appear with growing frequency, to set at naught our theories as to Mind. STUDENT

## ARCHITECT OF AIRY RHYME

T. B. Aldrich

**E**NAMOURED architect of airy rhyme,  
Build as thou wilt; heed not what each man  
says.

Good souls, but innocent of dreamers' ways,  
Will come, and marvel why thou wastest time;  
Others, beholding how thy turrets climb  
'Twixt theirs and heaven, will hate thee all their  
days;

But most beware of those who come to praise.  
O Wondersmith! O worker in sublime  
And heaven-sent dreams! let art be all in all;  
Build as thou wilt, unspoiled by praise or blame,  
Build as thou wilt, and as thy light is given:  
Then, if at last the airy structure fall,  
Dissolve, and vanish—take thyself no shame.  
They fail, and they alone, who have not striven.

—Selected

## Reincarnation

**W**HAT are we really? What do we think ourselves to be? How many regard themselves merely as that which eats and drinks, has likes and dislikes, is grasping and selfish, fearing death and often his fellow-men. But if we think of the matter seriously, is not such an idea far from the truth, a going back to the dark ages with their paralyzing dogmas of original sin and vicarious atonement? Is man then such a pitiful thing that another must needs die for his salvation? Has he fallen so low that he is willing to accept such a sacrifice?

But let us pause and consider, we who pride ourselves on our reasoning powers; is such a thing possible as that the act of another can avert the consequences of our own actions? Is such a thing in consonance with justice, or possible in a universe ruled by law? Would it not remove all sense of responsibility for our thoughts and deeds, and leave us puppets in the face of unsolvable problems? Does man consent to regard himself thus, as a weak pulsing creature, cringing to circumstance, "a miserable sinner," as orthodox religionists would have us believe; or, even in the face of overwhelming odds, as sometimes appears, will he not still fight against circumstance, and even in spite of his selfish desires, and the constant demands of the lower nature, act as a responsible being? That there are many who do hold to this latter course, is a matter of common experience, and of itself is a proof that there is something of a higher and diviner nature in man.

But ask why men so act, and how many could answer? It is a part of the message of Theosophy to give the answer, to reveal to man what is his real nature, his heritage and destiny; that no longer half blindly shall he fight his way upward but with full knowledge. Once that man grasps the Theosophical teaching as to his divinity, as to Reincarnation and Karma, and all life will take on a

new aspect for him. He will not be willing to believe, even as a religious dogma about which he may not reason but must accept on faith, that it is necessary for a beneficent savior to come to take away his sins and suffer for him and that thereby he may escape their results. He will realize that he must meet the consequences of his own acts and thoughts, even after many lives, it may be; and that the suffering that he has now to endure for which he cannot see the cause in his present life, must be the result of causes sown in the previous life, or in others far back.

The teaching of Reincarnation gives hope to man, it inspires courage, belief in himself, in his divine nature, it shows that no effort is in vain; it gives certainty of immortality, and awakens the realization of man as a soul that cannot die, for its roots are in the Eternal. This immortal entity, which is man himself, incarnates again and again in a mortal human body—the human-animal body, that eats and drinks, lives and dies—with the set purpose of gaining experience in the outer physical world, and of gaining full self-consciousness therein, and also of helping to raise up to a higher level of consciousness all entities on the lower planes of existence, and of which its own outer physical nature and personal consciousness are a part.

And to fulfil its destiny, the incarnated soul must subdue and conquer the animal nature with which as an indwelling tenant it is so closely associated. The passions of hate and lust, anger, jealousy, and pride, must all be slain if the upward path to freedom is to be gained; and generosity, love, compassion, brotherliness, and all kindred virtues be made a part of the habitual character. And all this is but a step towards the goal of perfection, which is our ultimate destiny.

Could all this be done in one life? No, but through Reincarnation it is possible, and as the result of the heroic struggles of many lives, the final victory will at last be gained.

The teachings of Karma and Reincarnation show that man's future is finally in his own hands, and that each deed and thought, whether good or bad, stamp their effect on the character and circumstances, bringing rebellion or contentment, happiness or misery, until the lessons of life be learned and we walk in harmony with the law. W.

## Greatness

If Sun thou canst not be, then be the humble planet. Aye, if thou art debarred from flaming like the noonday sun upon the snow-capped mount of purity eternal, then choose, O Neophyte, a humbler course.—*Voice of the Silence*

**T**HE desire to be first is certainly as old as time, and as the centuries have moved on has grown in no way quieter, and often more rampant. But an observer of life can easily verify that it is a desire which can never be satisfied. For when one position is reached, there are always others occupying those ahead. And even if for a short time a field may seem to rest in undisputed possession of some one, the accumulated fever of desire which has brought him to this point, seeing no new object on which to spend itself, rapidly consumes the unfortunate victim, and the end is a heap of ashes indeed.

So from the point of view of discretion and

common sense, it would seem simpler to subdue ambition and desire, rather than to let it subdue us later on. And until this is done, though there may be a truce, there will be no peace. Sometimes the desire shows itself as mock humility. It produces a superficial sensation of being of no use, no good in the world, and this often in the face of important duties which no one else can well fill. It is the subtle desire, sulking because it has no more prominence. Or it may show as a restlessness and discontent with everything.

It is well to face these things and so be done with them. For surely in a universe of which each one is a part, each one has a part to play. And the real greatness consists not in what it is, but how it is done. The planet is as necessary as the Sun. It is in the thought world where all are weaving the grand pattern designed by nature—or marring it. It is that world which is nature's great factory in which all are placed whether they realize it or not and where they work, or pull to pieces the work as it has been seriously put together by others. It is in that world in which all can become truly great. Let him who longs for it show his greatness by overcoming the desire for it. Then could the wheels in the great factory move without friction. STUDENT

## Our Differences

**P**ROFESSING with our lips the popular creed, *All men equal*, our actions cry out: "Let me be different!" and proclaim us heretics.

But many comrades have become different, we observe. Why not I? I, too, would advance over the heads of the masses. It seems that this life I am living is not what I was meant to do. Capable of important work I feel myself. I am convinced that there is in me something of rare worth.

The soul's urge, this, to come up out of the gloomy little one-windowed basement room where we have been seeming to exist. The soul demands, indeed, that we learn to perform great work, the magnitude of which we come so far short of comprehending that we translate the heaven-sent message into the beginning of some trifling culture—for our own getting-on, getting-away, reaching-out! It is easy to forget that the selfishness that puts on a shining gloss of "self-culture" is the same old selfishness of the spendthrift, the tippler. It is shocking, but through this selfishness is the bond strengthened between much ultra-refinement and these coarse types.

How about the comrades who have moved up into a different class? Not through strange processes has this come to them, this difference, this enviable distinction of having become different. It is imaginable that the difference we feel is the manifestation in them of an approach nearer the heart of all life. Possibly they have traced back their royal kinship with all. Perhaps to become real (and not in any way to assume any sort of mock-real) makes up all the difference there can ever exist between our littleness and the greatness of our great comrades. STUDENT

THE true road is plain and easy to find; it is so easy that very many would-be students miss it, because they can not believe it to be so simple.—*William Q. Judge*

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** How can it be supposed that the Rāja Yoga education will enable its students to go out into the world with an understanding of the problems of modern life, and ability to cope with them?

**Answer** There is a kind of implication here that children in other schools *do* acquire such an understanding and ability, but is there any truth in it? Some of the Universities do teach what is called "sociology," but—dare we whisper it?—*cui bono?* Are the problems solved?

Indeed, can we speak of *problems* in the plural, at all? The more and the more that minds have sorted out and classified these things, the more complicated have they become. A science has grown up, and with it the evils it studies and seeks to explain. But here are matters for *character*, not brain alone, to deal with, and no science, as such, has any clue or aptitude for unraveling them.

Upon what do all these problems rest? Ask the sociologist, and he will tell you much about supply and demand, transit, labor and capital, and all the weary rest: he has given your brain much to turn over and agitate gray matter upon; but *cui bono* again? What has he said to you, yourself; what has he given you, not to *know about*, but actually to *know*? He has shown you a series of micro-photographs of the growth of certain effects, but has remained discreetly silent on the matter of causes. If he had given you so much as an inkling of the cause, you would have gone straight out from his presence and begun to remove it; not to tinker with it, not to patch it up, but to remove it. For to know the cause of these problems would be to know yourself; the most difficult to be acquired of all kinds of knowledge, but the only infallible and certain kind when acquired. One, too, that does not come without compassion, for the innermost reaches of our being are not exclusively our own; they are universal, and open only to the soul set on the attainment of universal ends.

For all the problems of life, and indeed all the aspects of life of whatever kind, come from and rest upon one simple thing alone, and all the understanding we may get of it, is to be had from life, and not from books. That thing is man.

It is because *man*—the knowledge of man, *self-knowledge*—is not taught in the schools and universities that the difficulties have arisen. The scholars go out into the world knowing everything but themselves, and quickly begin to produce problems which anyone may solve who will—they themselves will have none of them. Impulses come to them which they do not understand, and have no knowledge how to meet. Two courses are always open to them, and for lack of knowledge of this unheeded science, the likelihood is that most of the time the right course will only be half taken or not taken at all. And every wrong choice made has worked something for them; covered up their better selves with a new film of selfishness, weakened them a little; in its degree unfitted them a little more for playing the part they came to play in the world: also it has increased the whole sum of human selfishness. The good impulses that arise now and again will not do much, as

against all the trend of a life. Not merely what is ordinarily called a selfish life, either; but the life of almost any man without positive altruistic aspirations:—the life of any man whose first aim is to pass his examinations; then to make enough money to marry on; then, to support his family in comfort, and so on. He need not be a criminal, or a capitalist, or a politician to be selfish.

The whole system of our modern education has one object, to cultivate a mild kind of selfishness. But fate in the long run *will* have a man declare which direction he means to take; hot you *shall* be, or cold; or the doom pronounced in the *Apocalypse* (*q. v.*) is awaiting you. Enlightened selfishness, and fairly good badness, and a rather truthful lie belong to the same family. You cannot waken a sleeping tiger, and feel confident that you will only go far enough to waken him a little, and that as you will leave him in peace then, so will he leave you. Or you cannot put a lighted match in a barrel of gunpowder, and stand by, expecting to have some fun with the explosion of just those few grains that the flame first touched. When a gentle impetus is always being given to selfishness in this way, it cannot but be that the results will come. True, a man may, and sometimes does, come out from the schools without a taint of it in him; but this is thanks to the power of resistance in his own soul, thanks to the hold which that soul has on the mind and passions of him; thanks rarely to the instruction he has had from his teachers.

There is always the lower man, with the possibilities in him of corruption and hell. Up from the unexplored gulf of those possibilities a certain stream of suggestion, even if it be but the very slightest, is arising intermittently into the region of one's consciousness; unsuspected as a rule, yet nevertheless at work, at work, at work. Many of course are on the side of the angels as we say; many mean well; but how many have gone right into that gulf, into the depths, and faced themselves, brought forth whatever there was of good and bad there, and strengthened the one and made an end of the other? Yet how shall any good and lasting work be done otherwise? Can you solve the problems that front mankind, if you are yet an unsolved problem to yourself? Solve that first, and set your house in order—and to do that, *do the schools and sociologists help you?* Man is the final and great thing in this matter, and it is not formulae that shall help or solve anything, but men. A million mediocrities, with all rules and sciences at their command, will accomplish nothing, or next to nothing; but bring one man on the scene, and he will quickly find a means. Does the science of sociology help you to be a man?

But Theosophy does, and Rāja Yoga does; for it sends the youth out with a knowledge of what he has to meet; armed and gleaming cap-a-pie, and alert. He knows well enough what forces are on this side and that in his being; he is not to be deceived or mistaken. Problems? Why, the world and its problems are all reflected within him; he has fought that fight before, and knows well enough when to lay on and when to walk easily. He is not confused by a thousand and one opinions, and the buzzing and flapping of a thousand and

one non-essentials in his mind; but he can recognize human selfishness; he can recognize the dark forces of life under whatever guise they may appear; and because he knows them for what they are and are worth, he can withstand them. K.

**Question** Why is not the Self lost if there is a continual reincarnation?

**Answer** The Self is not lost by repeated incarnations because It is the vital center of consciousness which chooses the instrument of a body whereby to grow progressively more individualized by rebirths just as an actor is developed by learning to play his parts. Each man, from his own view-point holds the center of his little cosmic stage, being more concerned with relating persons and things to himself than with their relations to others. In any life each adult plays the very different rôles of infancy, youth, and maturity without confusing his sense of identity with any change of scene or costume, though he has a new body every seven years.

Persons who tell about being "lost" in the forest, or in the desert, or at sea, really relate experiences in losing familiar surroundings; but in thought and feeling they still remained the center of a desolate stage and had no idea of losing their identity. Similarly a person under anaesthetics becomes unconscious of his body; but that the Self has been conscious somewhere is evident from the incoherent attempts during recovery to find the way back to familiar senses and sensations. We are so used to regarding the Self as the body—with an incidental Soul—that we forget how, during insensibility, the body loses its hold upon the real Self which animates its form. But as the inner man gropes his way back to the body consciousness, the usual incoherence comes from being confused between the condition he has been in and that to which he is returning.

No one would think of asking if an ignorant man would be "lost" by education, or a good theorist would be "lost" by practical work, or a busy sinner would be "lost" by right living; though, naturally, they would lose the old sense of mental, physical, or moral limitations. In each case the Self would be more individualized by a growing realization of its identity with an enlarged world of thought and things and feeling.

The interval between lives gives the Self opportunity in the impersonal light of truth to digest and assimilate its earth experiences. What to the brain-mind seems only suffering and failure is here seen to be valuable tuition. The Soul, which is all wise on its own plane, becomes more self-conscious in relating its greatness to the task of overcoming the strong material forces and the confusing physical senses of earth life. This knowledge of the purpose and opportunities of incarnation gives the soul courage and impetus for the renewed attempt at solving earth problems, so that it comes again with the sweet, pure, refreshing joy of the normal babe. The Rāja Yoga Schools established by Katherine Tingley are helping the little children to retain this inspiring sense of their divinity by teaching them to distinguish between mere body impulses and the high purpose of the reincarnating Soul. # THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

## True Individuality

A STATESMAN declares that in his country, the state is "taking the nation into custody." He deplores the decline of the sense of individual responsibility and the rapid trend towards reliance on legislative devices for protecting people and securing their alleged rights. This is a phenomenon that we see taking place in more than one country. There is nothing new about it, however, as the historian knows. Often has it been shown how the vigorous young Persian power overthrew the Babylonian empire after the latter had become weakened by the loss of individuality among its people; how the Persians again, having yielded to the same influences, were overcome by Macedon; how Greece was overcome by Rome, and Rome by the Teutons. All great movements are initiated by individuals, and races are strong as long as there is individuality among their people, but grow weak when the individuality declines and the people become a populace coddled by the state.

"Individualism" is a word upon which many people pride themselves; but it is generally used in the sense of personalism—that is, selfishness—not in that of true individuality. Of this true individuality we need a good deal more than we have.

In ancient times it used to be taught that human solidarity was the essential condition of true independence of the individual, and that under no other circumstances could free scope be found for individual initiative and the full development of individual genius. But nowadays, so mixed have our ideas become, altruism and individualism are regarded as a pair of opposites. We have confused individualism with selfishness, and fraternity with communism. Yet nothing is clearer than that in a people bound by ties of surest friendship, there can be perfect freedom of action for each; while in a body where there is strangeness, misunderstanding, and suspicion, everyone will be bound and fettered by the opinions of his fellows.

These schemes for protecting people against each other—what are they but acknowledgments that the people need protecting against each other? If our rights must be safeguarded by legislation, it means that we are unable to maintain them against our own individual greed. Thus communism may be described as

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

a sort of crystallized selfishness, a compact such as brigands might enter into to ensure a fair division of the spoils and protect each from the others.

A man who has true self-reliance has a possession that is inalienable. It can never be taken from him. Moreover, like other virtues, it diminishes not by being bestowed. He can communicate his priceless possession without in any wise diminishing his own store. But what is the basis of true self-reliance? This is the question which Theosophy answers.

All the teachings of Theosophy combine to produce first an intellectual conviction, and then a progressive realization, of the eternity and indestructibility of the Spiritual Center within. They teach a man to find out that within himself which is permanent, the source of exhaustless strength and inspiration. They teach us how to find our true individuality, which is and always has been the real inspiration of conduct and deeds. Men seek in vain among the creeds and sciences for sanction for self-reliance; and each generally falls back upon some nameless philosophy of his own, or perhaps gives it a name. Thus one man writes a book on "Loyalty"; another writes on "The Simple Life"; another on "Contentment"; and so on.

Each one of these seekers is after the true source of human strength; his intuition gives him an inkling, but the thought of the day hypnotizes and fetters him; he can find no forms in which to clothe his ideas; they are vague and invertebrate. Loyalty fastens one's interests to an impersonal ideal, thereby abating the self-seeking motive which is the cause of trouble. Many people have got so far as to recognize that self-interest is not the true motive-power of man; that it lures him towards an unattainable goal, and that it is an error. But, as current philosophies give no sanction for any other kind of motive, the abandonment of this motive seems like an abandonment of life itself. Hence we get

the many and multiform cults.

But self-abnegation is a voluntary internal motive, consequent on a recognition that objects of personal desire are after all, simply not worth running after, and upon a realization that there are worthier aims in life. We do not have to forsake the world; merely to change our own private attitude towards it.

The idea that self-abnegation is the gateway to a larger Self-realization is gaining ground among some thinkers; but of course we have to beware that we do not merely *exalt* self.

What is most needed is to convince people that there is some use in this, that it will be effectual. For under current religious and scientific theories there seems little warrant for it; self-sacrifice in order to save one's own personality for eternal life is not self-sacrifice at all. Nor, in seeking for a possible logical reason for self-sacrifice, is it easy to exclude the idea of self-interest and calculation of possible advantages. The key has been sought in that much-abused word "Love," an over-mastering influence that would take possession of the being and blot out all other motives like the sun blots out the light of lamps. But what, again, is Love? In fact, what are all these ideas: Love, Loyalty, Devotion, Wisdom, Altruism, Duty, etc?

Theosophical teaching answers that they are glimpses of the life of the inner Man, filtering through the mists of our superficial nature, distorted by our brain, colored by our desires. And for Theosophists the Soul is a present reality, the real Man, ever standing ready to manifest itself, awaiting recognition. It cannot manifest itself where selfish motives rule.

To return to the original subject, in this self-abnegation will be found the true individuality. For do we not exchange the servitude of desires, fashions, whims (our own and other people's), for freedom to follow the eternal Law of Righteousness (Harmony), that Law that guides the planets in their paths, carpets the earth with flowers, and establishes order and beauty everywhere? Do we not step out from the chain-gang of conventionalism into the ranks of Intelligent Powers? Our will ceases to be conditioned by anything save a Law which our Soul recognizes and reveres as the Truth, whose service is an eternal benediction and whose only restraint is an eternal obligation to achieve greater triumphs. T.

## THE THEOSOPHICAL ADDRESS AT ISIS THEATER

LAST Sunday, September 20th, after an intermission of several weeks, the Sunday evening weekly meetings of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, conducted by students from Point Loma under the direction of Katherine Tingley, were resumed at Isis Theater. The large audience which assembled showed the appreciation in which these meetings are held and the great interest that is taken in them. The program consisted of addresses by two of the young speakers of the Rāja Yoga Academy on the following subjects: "The Positive and Negative Currents in Life," and "The Need of Realizing the Higher Ideals in Life."

The first speaker, Montague Machell, drew an illustration from the phenomena of electricity, but said that although scientists had made a close study of the positive and negative forces in matter, they failed to realize the existence of these forces on the mental, moral, and spiritual planes. It is these forces that the Rāja Yoga student is taught to recognize. The positive side of the nature must be developed. We must not only strive not to do wrong, but must do right. Only by realizing his divinity, by holding his heart open to the higher and diviner influences, can man gain that self-control and knowledge which shall render him positive to all the lower forces of his nature.

The other speaker was Charles Savage, who referred to the great need at the present day of realizing in actual life those higher ideals so often written about, so often spoken about, but so seldom practised. The dominating principle in human life today, he said, is selfishness, and it is this general tendency in human nature that must first be combated. He drew illustrations from the downfall of some of the nations of antiquity which resulted from the loss of their old ideals and their becoming enervated with luxury and gratification of self.

The music which formed a special feature of the program was rendered by the Rāja Yoga Orchestra, and included *Concert Overture No. 1* by the youthful composer Rex Dunn, who is also the conductor of the Orchestra. There were also clarinet, 'cello, and violin solos, and other numbers which made the meeting an interesting and delightful one throughout.

OBSERVER

THE whole order of Nature evinces a progressive march towards a higher life. There is design in the action of the seemingly blindest forces. The whole process of evolution with its endless adaptations is a proof of this. The immutable laws that weed out the weak and feeble species, to make room for the strong, and which ensure the "survival of the fittest," though so cruel in their immediate action—all are working toward the grand end. The very fact that adaptations do occur, that the fittest do survive in the struggle for existence, shows that what is called "unconscious Nature" is in reality an aggregate of forces manipulated by semi-intelligent beings (Elementals) guided by High Planetary Spirits (Dhyān Chohans), whose collective aggregate forms the manifested *verbum* of the unmanifested *logos*, and constitutes at one and the same time the MIND of the Universe and its immutable LAW.—H. P. Blavatsky, in *The Secret Doctrine*, vol. I, page 277

## Ignorance Concerning the Bible

THE following remarks about the Bible are condensed and quoted from the *Kansas City Star*, which in its turn is quoting from a paper on the origin of the Bible contributed by a clergyman to *Appleton's Magazine*.

The history of the Judæo-Christian Scriptures is most curious and interesting.

"The notion loosely floating about is that the Bible came down from heaven, cleanly printed, nicely bound in morocco and gilt edges, with a bookmark against the text which has erroneously been made to declare that every scripture is inspired of God."

The earliest version goes back to the Second century B. C. The earliest Hebrew copy of the Old Testament of undisputed date, however, goes back only to the Tenth century of the Christian era.

"The Revised Version is based on the Author-

tempted, and different versions of the Old Testament became necessary at a very early date. The chief seat of the Hellenistic Jews was in Egypt, and it was here that the Alexandrian version or *Septuagint* was compiled.

Ptolemy Philadelphus, ruler of Egypt during the Second century A. D., summoned, according to the story, seventy-two Palestinian scholars. These he shut into seventy-two different cells, each with a scribe, to prepare from the existing data a Bible in Greek. When the task was finished, according to the story, the translation of each was found to be absolutely identical with all the others in word and letter. Hence this compilation is often referred to as the Miracle of the Septuagint. Another writer has it that the scholars were put two in each cell, thus making thirty-six translations instead of seventy-two.

Concerning the chronology of the New Testament there is even today much argument and many theories have been advanced to explain its apparent anachronisms. Perhaps the most interesting is that known as the Tübingen theory. Briefly, this holds that if a revelation is miracu-

QUAINT STONE HUT, KINNEKULLE MOUNTAIN, SWEDEN

ized version, which is an improved edition of the Bishops' Bible, which was a bad copy of Cranmer's Bible, which was based on Coverdale's translations of Dutch and Latin translations and Rogers's version of Tindall's Bible!"

And even this pedigree covers only the later period.

The word "Bible" is from the Greek *Biblia*, meaning a collection of books. During the years when the Bible was taking form, it drew its substance from two sources, the historic and the prophetic. In the earliest days the matter which now constitutes certain books was handed down by word of mouth; later by vowelless writing. The time and manner of collection of the various books is uncertain and obscure. The selection of the canonical books is mentioned as early as 130 B. C. The Old Testament has three currents of influence; the traditional lore of the priests, the teaching of the prophets, and the religious life of the more enlightened people. This caused difficulties when codification was at-

tempted, it naturally escapes the restrictions of a purely historical narrative. In other words, a miraculous revelation may deal at once with events past, present, or future. Of all theories put forward this seems best to answer the objections of critics who look for flaws in the New Testament.

One of the great questions of the Bible is that concerning the canonicity of its books—that is their right to be quoted as Scripture. Different versions of the Bible admit or exclude various books, and these latter generally are referred to as the apocryphal books. Originally the word, of Greek origin, meant hidden—that is, esoteric. But it has now received an entirely different meaning—that of doubtful, or even spurious.

This concludes our quotations. Remark- ing on them, it may be pointed out that the Bible as interpreted in a dead-letter sense, and the Bible as an allegorical and symbolical scripture, are two entirely different things and should be carefully distinguished. If the Bible is to be taken literally, in the sense of its outer meaning, much of it becomes absurd,

much untenable, and much mere commonplace. Criticised from this point of view, it can be picked all to pieces. The stories are such as may be found in many other ancient works, and some of them are preposterous and others have extremely doubtful morals; some, again, of the teachings are excellent, but not by any means unique or extraordinary. We have to remember also in this connexion that the Old Testament has a *kabalistic* interpretation, known to some few Hebrew scholars, whereby an esoteric meaning, unrelated to that of the text itself, is revealed. This is surely a remarkable fact. If the Old Testament is thus largely a secret code, what becomes of the value of its dead-letter interpretation?

It has been said that the Bible has at least three interpretations: this kabalistic one, an allegorical or moral one, and the dead-letter one. Of the former two we can readily trace proofs. The words attributed to Jesus are often those familiar to ancient mystic science; such as baptism by fire and water, the symbols of blood, the vine, the cross, purification of the gross elements of our nature by fire; passage of the pure part of our nature to the abode of bliss; and so forth. Scholars frequently trace the derivation of these symbols from Egyptian, Chaldaean, and other sources.

The Bible is one of the religious scriptures, containing, concealed in allegorical form, a certain amount of esoteric teaching concerning the Mysteries; in its outer sense it is a pious book. Its history is certainly curious; and its numerous compilers and translators would seem to have often been playing parts of whose significance they were unconscious. But who understands the founts of his own actions or the source of his own incentives? There have always been Those whose interest and duty it is to keep alive the records of eternal wisdom; and when no longer able to do so directly, to do so by means of symbols and allegories, thus preserving them against the day when their true meaning will become known.

The writer quoted says that there is no danger from too much knowledge of the Bible, but there is danger from ignorance concerning it. This depends on what one means by danger. It is not to be supposed that knowledge concerning the real nature of the Bible will conduce to a preservation of the old ecclesiastical traditions, or even allow ecclesiastical organizations to make a corner in religion and call it Christianity. Real knowledge of the Bible must finally show it to be *one* of the *many records* of the ancient Religion. It must show that the Christos allegory is a universal symbol, far antedating Christianity; and that in the Bible as in other Scriptures, allegory is interwoven with the alleged life-story of a holy man. All uniqueness and specialness must vanish from the Christian tradition, and it must take its place as one among many.

The attempt of churches to build a permanent edifice of faith upon the Christian tradition apart from other sacred traditions, is doomed to failure, because it can never withstand the advance of knowledge. Whatever the treasures the churches may offer us, we shall be able to prove that these are imitations—often sorry ones—of what we have access to from other sources. The churches are now

making desperate efforts to keep their lumbering medieval chariot in the forefront of progress, but it can never adapt itself sufficiently without losing its identity. Perhaps they will capture the *unthinking* portion of humanity, thus acting as a retributive justice on those people!

E.

### Psychology in Pictures

A READER, wearied one night of his much reading of heavy volumes, retired to rest. He had been reading of the nature of man, and he thought as he prepared for bed: "Here am I, *a man*, the very thing the books are treating of. Surely, since I am myself the subject of all those books, there must be some directer way to understand myself, some way of looking at *the thing they treat of* instead of at the pages which treat of it."

Then he slept, and two or three simple pictures detached themselves in his thought.

He was a youth, full of splendid health, so that his very body shone with the light and joy of the pulse of his veins. He was conscious of some divine task, and this presently symbolized itself quite simply. He was to take a spade and till the waiting earth. There were many others, all with the same radiance about them and with the same task.

He began to dig and presently became intensely interested in his work. So interested was he that he presently forgot that it was his *duty* and even what he had undertaken to do. He dug the earth in strange and silly patterns, made childish castles and ditches, and planted nothing.

Then a curious duality, a splitting of consciousness, occurred. He was looking on at himself digging, being now spectator and digger. As spectator he remembered fully the sacredness of the task and still felt the splendor of his pulsing youth. As digger he had forgotten both.

So the digger dug furiously and fascinatedly, and as he did so his clear shining vitality *passed down little by little into the spade* and he himself became correspondingly weaker, smaller, paler, and bent over the tool. The spade was absorbing him. It was at last practically himself and he had forgotten all else. It seemed to him to be himself. Full of his vitality, its activities became wilder; it executed all kinds of aimless folly, and in addition began to take delight in hitting sideways at the spades of the other diggers, trying to break them and drive them off the field or take for its own the equally useless structures that they had been throwing up.

When this had gone on a long time the dreamer became acutely pained to see the abject folly of that other who was himself and he tried to wake him to some memory of his task. Ultimately he began to succeed and the digger rubbed his eyes and began to look around and note where he was, at last fully remembering what he should be doing with the spade and what afterwards planting.

But now the spade had things almost entirely its own way. For a few minutes the digger would master it and make it do a few trembling strokes of the right kind, with some meaning in them. Yet in a moment, and then for hours, the spade would again be master. Later, in the brief spaces of self-recognition

and meditation, the digger would look at what he had done in the hours of forgetfulness and fall into blank hopelessness at the new task confronting him—the mastering of the spade, the regainment of his lost vitality.

But the other stayed ever close at hand to encourage him, to urge him to make some effort to come to himself even during the maddest freaks of the spade, and to try to keep his memory awake.

Though the digger did not notice it and remained mostly despairing yet regularly trying, nevertheless at every attempt and particularly at the special moments, a thin stream of his vitality began to return to him from the spade, and with it there were gleams of memory. Victory began to come in sight; though the spade was still absurdly wobbly and trembling and from time to time made kicks towards its old foolishness.

The admonitions were better and better heard and were now recognized. The digger was consciously turning for help to his Higher (and original) Self.

And at last the victory was gained. The two merged into *one* with the old splendor, but the one recognized that he had learned much from the long and painful experience—though the poor earth had had to wait. He had learned how to use his own forces, how to conserve them, and the capacities of the spade. With all this extra knowledge he might even now hope to work so much more quickly as to regain all the lost time.

He perceived also that he now desired to try to awaken his comrades, to help *their* dreaming Selves to waken their digging selves. Some of them, he noted, had let their spades actually break themselves in the frantic foolishness. A new one could be gotten, but they would have to make it for themselves, to retire from the field for the purpose and to carpenter the wood and iron with incredible pain and difficulty.

Then he awoke, and behold he had a psychology in pictures! And he understood that that division of consciousness into digger and watcher, so that the two were at once two and one, a thing that had been quite clear to him in the dream and even still remained so, could not be understood by the brain, and could not therefore be reasoned out in the great books. It could only be stated. It was *not* usually stated, however, because the sameness-and-otherness affair could not be reasonably put in systems of philosophy that were made of notions merely and not founded on self-realization. He even suspected that the making of these systems was often merely part of the frantic work of the spades!

For the spade is the brain; and the digger is the personal consciousness that has forgotten its real light and youth and joy and purpose on earth; and the watcher is the Soul, the consciousness that has *not* forgotten, and from which the other has separated itself off.

And real health, even of body, cannot be gotten until vitality has been drawn back from the brain-spade and the latter completely dominated. Still, practice will make perfect in this as in other things.

STUDENT

LET once man's immortal spirit take possession of the temple of his body, and his own divine humanity will redeem him—H. P. Blavatsky

## Art Music Literature and the Drama

### Grieg—Norway's Greatest Musical Genius

EDVARD GRIEG, our greatest Norwegian composer, recently deceased, was a personage of many merits. As composer of world-wide fame, an ardent patriot, and man of culture, his name must stand among the great ones of the century. It is not surprising that he attained eminence in his profession, for he comes of a strong race and his parents and ancestors were people of character and ability. Grieg's father was English Consul at the city of Bergen. His great-grandfather was a Scotchman who spelled his name "Greig," which later was changed to suit the language of the newly adopted country. His mother was a pure Norwegian, and her ancestors were of the nation's statesmen and ministers.

Edvard Grieg was born at Bergen, Norway, June 15, 1843. He inherited his musical talent from his mother, who was a pianist of ability and distinction, and it was she who inspired the boy Edvard, and first brought out his genius. She showed her wisdom by beginning her son's instruction early, teaching him the piano at six years of age, and supervising his practice. Edvard was inclined to be dreamy and not to apply himself to the lessons assigned him; but his mother kept him strictly at his tasks, and taught him to make practical use of his talent. Had it not been for her severe sympathy and understanding, the world might have heard less from Edvard Grieg.

Although Edvard's father played the piano a little, he did not have much taste for music, and frankly admitted that he did not care for his son's music. At school the boy was given to idleness, not being able to see the value of learning that which he had no interest in; and when, instead of attending to his studies, he brought his first musical composition to his teacher, he was sharply reprimanded and told not to waste his time in that way.

When Edvard was about fifteen years of age his father took him on a trip to the mountains. The clear air, rushing torrents, and the wind in the trees awakened the lad's deep love for nature. In fact, he was so anxious to interpret nature that he wished to become a painter; but fortunately for the musical world, he became a tone-painter instead.

The frequent soirées held at the Grieg home, in which Madame Grieg and other artists furnished music of a high order, had already cultivated the boy's musical taste to a marked degree. About this time a visit from Ole Bull, the then greatest violinist of Norway, served to turn the tide in favor of music. Upon hearing Edvard's compositions and his piano playing he at once recognized the boy's exceptional ability, and advised that he be sent to the Leipzig Conservatory to study, which plan the parents immediately adopted.

At Leipzig the young musician found trouble in store for him. The teachers were exacting, and to him it seemed that they laid out dry, tedious studies, unsuited to further his musical growth. However, he realized he could not afford to lose his time as well as his position among fellow students, so he strove ardently to master the work before him. The energy instilled into him through his mother's patient efforts served him well at this time; so intense were his efforts, indeed, that he was seized with an attack of pleurisy, which left his already frail body possessed of but one lung.

The sufferer was brought home to be nursed by his mother. When better, he returned to

fact, something of a "Danish Mendelssohn."

Grieg, however, was not to be put into a narrow groove, for his individuality was too strong to be crushed. He found the new path he was to follow partly through his own innate feelings and convictions, and partly through the influence of his two compatriots, Rikard Nordraak and Ole Bull. The former was a gifted and zealous young Norwegian composer who died too young to attain great eminence, but he rendered an important service to Grieg.

The two young men realized that their country had something of real worth with which to enrich the musical world, and they resolved to hold fast to the Norwegian spirit in their music. Grieg said:

It was as though scales had fallen from my eyes; for the first time I learned through him the northern folk songs and understood my own nature.

Ole Bull sometimes took Grieg with him on his tours to the mountains where they greatly enjoyed hearing the national airs as the peasant fiddlers played them. These wild melodies Ole Bull then performed in his own inimitable fashion for Grieg and the rest of the world, creating the greatest enthusiasm.

Liszt was also a means of great encouragement to Grieg at a time when he most needed it, and was one of the first to discover his genius. This "king of pianists" wrote the young composer a warm letter of praise after hearing for the first time his Sonata for violin and piano, *Opus 8*. He said: "Keep steadily on; I tell you, you have the gifts, and — do not let them intimidate you."

Soon Grieg's fame had spread considerably. He had expressed something new and refreshing which, while original and national in spirit, carried a message of cosmopolitan significance. The government of his native land set aside a stipend for his maintenance which enabled the young musician to devote his entire time to composing, and so reserve his strength for his real work, instead of consuming it in the mere making of a livelihood. **TWO LOMALAND MUSICIANS**  
(TO BE CONCLUDED)

EDVARD GRIEG

his studies; but soon decided to leave Leipzig and go to Denmark. Here, at Copenhagen, Edvard placed himself under the composer Gade's instruction, and found his influence to be more in sympathy with his ideals. Gade encouraged the young man to write music in the larger forms, and to some extent awakened a new era for him.

As Grieg worked on, his compositions showed more and more of the Norwegian spirit so strong in him. Gade, upon hearing one of his violin and piano sonatas, spoke of its being too decidedly "Norwegian." "The next will be more so," said the pupil. Grieg had found even Gade too restricting for him, for he too was not altogether free from the traditional methods, and was himself, in

### Russian National Music

THE Russian people are only beginning to realize the value of the still existing remnants of Russia's old musical life. During the last two centuries or so it had become the fashion to despise everything pertaining to peasant life and the Russian national instruments became even objects of derision. This feeling was fostered, if indeed not generated, by the priests of the Greek Church who, because the musical instruments that were distinctively national had come down from "pagan" (!) times, called them "instruments of the Evil One himself." Thus was a blow given to the national music which has never since risen to the heights it reached and held during prehistoric times. **STUDENT**

The judge is condemned when the guilty is acquitted.—*Publius Lyrius*

### Theosophy Must Be Applied

**M**ANY women-students all over the world live their days in grateful recognition of the light Theosophy has thrown upon all the problems of life, and yet they find it very difficult to maintain in their own natures the harmony which more than ever before appeals to them as an ideal to be made actual. Why this should be so is not understood. With the mystery of death revealed to them by the teachings of rebirth and the septenary nature of man; with the deeper understanding gained from knowledge of the duality in Nature; with the power added to any appeal made to others to do right, by belief in the divinity inherent in every one; and with the greater hope, and the greater ideal to strive for, why is not life one unbroken, harmonious uplift towards higher conditions in the home and in the world?

It is because, though the energies are now most of the time directed along higher lines, they have not always been so, and women meet day by day the results of these old conditions, which they can either strengthen to return to thwart their better efforts, or deal with in such a way that these ghosts of an undisciplined past have less power to make themselves felt when the next cycle of their reappearance brings them forward. To do the latter is to destroy the enemy and to avail oneself of reinforcements at one and the same time. But how often is it done? It is so easy to succumb to an old mood. Women have slipped down into these sloughs so often that only the most resolute self-restraint will prevent them from yielding to these influences. The chief difficulty is that they are not always on the alert, not always vigilant. They may have reasoned ably with themselves, have vowed that they never will fall into that mood again, but—they are in it, their fine self-control gone before the approach of danger was suspected. Then all that remains is patient self-restoration and the endurance of the

### AN INDIAN'S RITUAL PRAYER FOR A LITTLE CHILD

The life of the infant is pictured as about to travel a rugged road, stretching over four hills, marking the stages of infancy, youth, manhood, and old age. On the eighth day after the birth of a child the parents, through certain prescribed forms, send for the Medicine Man. In due time he comes, clad in his priestly garb, and stands at the door of the tent wherein the child lies. Raising his right hand to the sky he calls:—

**H**O! Ye Sun, Moon, Stars, all ye that move in the heavens;

I bid ye hear me!

Into your midst has come a new life.

Consent ye, I implore!

Make its path smooth, that it may reach the brow of the first hill!

**H**O! Ye Winds, Clouds, Rain, Mist, all ye that move in the air;

I bid ye hear me!

Into your midst has come a new life.

Consent ye, I implore!

Make its path smooth, that it may reach the brow of the second hill!

**H**O! Ye Hills, Valleys, Rivers, Lakes, Trees, Grasses, all ye of the earth;

I bid ye hear me!

Into your midst has come a new life.

Consent ye, I implore!

Make its path smooth, that it may reach the brow of the third hill!

**H**O! Ye Birds, great and small, that fly in the air;  
**H**O! Ye Animals, great and small, that dwell in the forest;

**H**O! Ye Insects, that creep among the grasses and burrow in the ground;

I bid ye hear me!

Into your midst has come a new life.

Consent ye, I implore!

Make its path smooth, that it may reach the brow of the fourth hill!

**H**O! All ye of the heavens; all ye of the air; all ye of the earth;

I bid ye all to hear me!

Into your midst has come a new life.

Consent ye, consent ye all, I implore!

Make its path smooth; then shall it travel beyond the four hills!—*The Musician*

suffering and exhaustion caused by letting in the disintegrating forces of the lower emotions, which work slyly and swiftly and steal all the reserves of strength.

Sometimes it is distrust of self that forces this quick surrender; sometimes envy, which of all the vices has the most numerous array of successful disguises; sometimes the unchecked habit of censure and criticism (perhaps foolishly yielded to in the attempt to "make talk") so wrecks unity of feeling among those closely associated that before it is restored veritable gusts of detestation and intolerance have to be overcome, though their birth and growth were not noticed.

Conscious and determined resistance must be made against these dangers that beset the inner life. They must be withstood and withstood until, meeting no encouragement from within the nature, they retire, defeated. The very lethargy which keeps women unaware of the approach of moods is a relic of the old unenlightened life. It must be cast off. The tactics that will outwit these sly moods must be mastered by women. Recognizing the duality of their natures, resolving to circumvent the evil, let them call upon the resources possessed by all women though not always applied to the highest use; let them plan defenses and surprises for their enemies, these old moods, and earn the satisfaction of seeing them slink away helpless. A conscientious and steady application of Theosophy on these lines would turn the power inherent in women against their *real* enemies and lead to the peaceful adjustment of harassing affairs.

A Teacher said recently, "Guard yourself well when you feel very masterful and inclined to carry everything your own way." How many women recognize the wisdom of this warning? How many know from experience that the overweening self-security of one day has its inevitable effect? The balance has been lost and must be regained, though often before the state of things is understood

some trying hours have to be experienced. Vigilance, the application of wits to actual dangers, would have averted the trouble.

Self-study is in fact more needed than the forms of culture that prevail among women today. It is courage in facing shortcomings, discrimination, patient self-conquest inspired by high resolve, that bring the power to help humanity and establish harmony; without the keenness and insight thus gained, tenderness and sympathy are often wasted upon idlers, whom women cannot recognize as such because within themselves lie idle the powers that guard against the sly monsters that feed upon unregulated human nature. By self-conquest women gain true compassion and the ability to protect. The outer armor of egotism and mere self-confidence soon proves vain; but everywhere at all times, women can, by a determined effort to *choose* their moods, be building the bright inner armor which shields from evil all within the compass of its radiance. The life of the woman who thus steadily and courageously applies Theosophy will at last grow Athena-like in its power to bless humanity. STUDENT

### The Force of Example

THERE is nothing new in speaking of the force of example, but like many an old adage, "the salt whereof has lost its savor," this has become a stereotyped phrase which we speak lightly, heedless or forgetful that within these words is a power that can turn the human race toward good or evil. When we as a race realize that every thought, word and act produce a virtually never-ending effect, there will be less crime in the world, less insanity, less disease, less corruption and darkness of all kinds. For though we may wish to evade the responsibility, each is his "brother's keeper," and the souls that are working through these human bodies are more closely interlinked, even, than these bodies are by the ties of kinship; and every wrong word spoken or deed done by one, casts a shadow before all others, obscuring the light towards which they travel, and making their footsteps uncertain. The greatest responsibility falls on those who have strength of mind and body, for if the strong of the world were pure and determined there would soon be no evil—the weak would follow in righteousness as they now do in vice.

We hear sometimes of magic—yet has not the word almost lost its rightful meaning, so infected has it become by connexion with psychic frauds, with charlatans, spiritualistic phenomena, "healers," hypnotists, crystal-gazers and the like? But there is a pure white magic of which the soul by right is master. By the force of example, one can transmute the iron of the lower nature into the gold of virtue, can generate in others what qualities he will; for an example of courage and heroism kindles the flame of the same virtues in other hearts. The true general leads his men to victory or into the jaws of endeavor and death, by himself showing the way. An example of faith, of patience, of honor or of benevolence, is a flame at which all the torches of the world can be lighted, itself never growing the less. No limit may be set to the influence of a noble life—and here is at once the terror and the opportunity

of womanhood. Long after the body has crumbled into dust, the life lives in the hearts of others, taking them a step nearer to the Golden Age that shall be on earth. By this power the Saviors of the world have led and uplifted mankind—it is the secret of their wonderful influence, and to come into contact through any channel with such a living example of the highest that one can conceive, is an inspiration that should lift us above our lower natures, above all sordid claims. The life of the Nazarene shines like a star through the darkness of the ages, the example that he set is alive today, though we have left no actual word of his, no tangible proof even of his existence.

Example is the most powerful weapon of reform and every reformatory movement that

A GREEK TYPE

has not for its body-guard the example of the lives of its supporters is foredoomed to failure. How many good systems of religion and ethics today are useless, dead, for lack of this vitalizing power! And so with the life of a nation; great is the responsibility of those who sit in high places, of those who have wealth or talent or education—if they be corrupt and self-indulgent, if they ignore the sufferings of their brothers, seeking instead their own pleasure and ease, what can be expected of those who look up to them? Does not the French Revolution seem a natural consequence when we look at the lives of the French nobility of the time? "For unto whomsoever much is given, of him shall much be required; and to whom men have committed much, of him will they ask the more."

And women—ye who through parentage or teaching are molding the future of the race, ye who claim the care and instruction of little

children—overcome your faults and selfishness, set aside your own selfish desires, that the little souls entrusted to you may not be discouraged, stifled, sickened, by your example. Mere words avail nothing with a child, for the child's intuition penetrates every insincerity, every inconsistency, and your teaching and preaching will go for naught if your life, your example, do not correspond. If through your indolence or selfishness or ambition or ignorance this power that is in your hands works harm to them, beware—for "Whoso shall offend one of these little ones, it were better for him that a millstone were hanged about his neck, and that he were drowned in the depths of the sea."

Many inquirers have been told, doubtless, that Theosophy is very mysterious and difficult to understand, that its followers live strange lives, ignore the practical side of life and lose all usefulness in search of chimeras in the misty past—all this quite gratuitously and always from enemies of progress. Judge for yourselves and have a care lest you condemn through ignorance—which unbrotherliness the Great Law will not regard as innocence—for one of Theosophy's deepest "mysteries" is to lift the world to truth, courage, and right living, *by the force of example*.

Katherine Tingley requires from her students lives that are pure and unselfish, lives that can be penetrated by the searching light of truth and found clean. To those who have not discrimination enough to find the way for themselves, to those who are lost among the various churches and sects, the many sciences and dogmas, the many cults and "isms," each claiming to be true, I would say, Study that ancient Wisdom-Religion which is called Theosophy and which means Universal Brotherhood, watch the lives of the true followers of Theosophy; you will find them honorable, upright, and true; study their motives, you will find them working for the good of humanity, not for money, ambition, or power. STUDENT

### Jottings and Doings

(From a Student's Note Book)

A RECENT archaeological discovery made upon the island of Monemvasia, a prefecture of Lacedemonia, brings the "Eternal Womanly" again to the forefront of public attention. It is a terra cotta statuette, not large but of exquisite workmanship and design, representing the goddess Venus. The figure holds a mirror in the left hand, with the right supporting a garment about the form, the pose being startlingly suggestive of that of the Venus of Milo. Indeed it is the opinion of the conservator of the National Museum, Athens, Greece, that it is the work of some sculptor of more or less remote date whose aim was to imitate the spirit and pose of the Venus found on Melos.

THE fourteen-thousand-dollar prize for the best design for bronze doors for the Annapolis Naval Academy has been awarded to a young American woman, comparatively unknown before she received the commission for the statue of the Winged Victory at the St. Louis World's Exposition. There were thirty-four competitors, this young sculptress being the only woman to enter the lists.

# OUR YOUNG FOLK

## Velásquez

IN the foremost rank of those men whose greatness of soul and integrity of character shine through their work, like a strong pure light, stands Velásquez, the great artist of Spain.

Velásquez was the son of a noble family of Seville. He was born in 1599; thus he lived at the same time as Shakespeare, and there are many points of resemblance between these two men. Both Shakespeare and Velásquez loved mankind. Both were men of such large heart and ample sympathy that they could enter fully into the hearts and minds of people of the most varied rank and character, and reveal each as he actually was. Velásquez painted king, pope, princes, princesses, noblemen, boors, dwarfs, beggars, wise men and street children with such entire forgetfulness of himself, and such fidelity to his subject, that the soul of each one speaks to you from his face. "*Verdad no pintura*"—truth, not painting—was the artistic motto of Velásquez. He did not paint to show his own skill or mastery of painting, nor to reveal his own personality, but to be true to the subject before him. Therefore the pictures of Velásquez are an inspiration to all true artists, who study his paintings with the same loving reverence that poets pay to Shakespeare.

Though Velásquez studied with two artists of Seville before he was nineteen years of age, his real teacher was life itself. The market place of Seville, with its varied types of humanity, was his field of study. Here, by patient, faithful, loving labor, he learned to portray character by the subtle play of expression on the human face and the unconscious postures of the body.

When Velásquez was twenty-two years old, an event of moment occurred in Spain. The king, Philip III, died suddenly and his son, then a promising youth of fifteen, ascended the throne. This was a most welcome change to the Spaniards, for Philip III had been unworthy his high place. Madrid and the court of the young king, became the magnet that drew the youth of Spain. To the capital they flocked, Velásquez with the rest. Although possessed of letters of introduction, he did not gain admission to the court, and after a year of waiting he returned to Seville. Soon, however, an invitation to Madrid came from Olivares, the all-powerful minister of the king. Such an invitation was equal to a command.

When the first portrait by Velásquez was taken to the royal palace, and displayed to the young king, he was charmed by its ex-

Lomaland Photo. and Engraving Dept.

BALTASAR CARLOS, ELDEST SON OF PHILIP IV  
PAINTING BY VELÁSQUEZ. METROPOLITAN MUSEUM OF ART

Velásquez also painted the children of Philip IV. He must have loved them dearly, for his pictures of the royal children are charming, as you can see by the portrait of the handsome boy who regards you so seriously from this page.

Another portrait of this same prince shows him as a gallant little lad of seven, astride a horse that gallops toward you. His proud, sparkling dark eyes and manly bearing, his richly embroidered dress and flying scarf, proclaim him a Castilian throne-child.

Velásquez the man was no less noble than his art. This was proven on the occasion of the visit of the great Flemish artist, Rubens, to Madrid. Rubens was then at the height of his fame, and Velásquez welcomed him most cordially, with no trace of jealousy, and himself escorted the visitor to the royal palace and presented him to the king. He also gave Rubens the use of his own studio.

It was upon the advice of Rubens that Velásquez paid a visit to Italy to study the Italian masterpieces. But he remained true to his own character and faithful to the traditions of his country, the greatest representative of which in the world of painting he by his supreme art made himself.

STUDENT

## Meteorites

METEORITES are masses of mineral or metallic substance which fall to the earth from the heavens. According to tradition the iron found in them was used long ago in making weapons, but scientific men were not inclined to believe in them till about a hundred years ago, when several meteorites fell in France and England. They were thoroughly investigated, and now no one doubts their genuineness. Meteorites do not contain any elements unknown to us and do not indicate anything about the place they came from. There is a strong resemblance among those which have been found. They are divided into two main classes, metallic and stony. Very few have fallen since the time when scientific men began to study them.

Last year the officers of a steamship crossing the Atlantic saw four meteors, the last of which dropped into the sea not a mile away from them. It was like a great shooting star as it descended, flaming, and leaving a trail of fire behind it in the air. When it struck the sea a cloud of steam rose at once and the water seethed as if boiling. If it had dropped on the ship there would have been a serious fire. Ships may have been lost in this way. R.

WHERE is the service which can escape its remuneration? What is vulgar and the essence of all vulgarity, but the avarice of reward? 'Tis the difference of artisan and artist, of talent and genius, of sinner and saint. The man whose eyes are nailed, not on the nature of his act, but on the wages, whether it be money, or office, or fame, is almost equally low. He is great whose eyes are opened to see that the reward of actions cannot be escaped. . . . The genius of life is friendly to the noble and in the dark brings them friends from afar.—Emerson

cellence. Velásquez was told that he might paint the king's brother, but the order was changed and the young king himself sat for his portrait. Philip IV did not fulfil the promise of his youth, and it is, indeed, chiefly by the portraits painted of him by Velásquez that he is remembered. He invited Velásquez to live in apartments in the palace, and for nearly forty years king and artist maintained a friendship. During this period Velásquez painted his royal patron many times. Never did he flatter him in the pictures. He painted him just as he was, with fidelity and truth.

# THE CHILDREN'S HOUR

## A CHEVALIER OF THE ROCKING HORSE

Nancy Byrd Turner in August Lippincott's

**B**OOTED and spurred, we saw him mount,  
Just as the light was dying.  
He flung to his place with an easy grace  
And sent his good steed flying;  
Flutter of mane and clink of spur,  
Into the shadows faring:  
Some urgent need, some gallant deed,  
Had called for such swift daring.  
He must have finished the mystic quest  
And come back weary-hearted,  
For, bedtime near, we found him there  
In the place from which he started,—  
The horse beneath his burden still  
A faithful vigil keeping;  
And, arms out-thrown, face downward, prone,  
The small knight-errant, sleeping!

### The Children of the Queen

**I**T had been a day of difficulties and Nora fell asleep wondering how it was that things so often went upside down. It seemed as if she woke to find herself in a lovely house with glass doors all round and she standing in the center, clad in dazzling white and listening to strains of sweetest music. Behind her stood a beautiful lady whom she felt rather than saw, and she felt very happy, safe, and at home. Presently she moved to one of the doors and looked out. Though all was so bright within, outside the streets were sloppy with a drizzling rain and the sky was gray and lowering.

She saw too, that all down the street was a row of houses like her own, and within each stood a radiant figure as with her, but unlike herself the children were *outside* and all the doors were closed. Looking closely she found that in most cases they had turned their backs to the doors and were facing the street, furiously blowing brass trumpets or beating big drums, each in his own way, and to a different tune.

The noise and confusion were terrible, and the children, ragged and cold, looked most unhappy. Now and then one here and there half turned toward the house and seemed to listen. One child with trumpet broken beyond repair, after a few tears turned wholly to the door, and lifted the latch. Some close to her laughed and mocked, and blew theirs even louder than before. The beautiful Being within the house stretched out her arms towards the weary child, and Nora, touched to the heart, turned to the Wise One beside her.

"How can I help them?" she said, "see, one is trying to enter but she seems so tired, and the others are making such a noise."

"Open your doors!"

Nora looked round but could find no fastening; meanwhile the child wavered, and Nora, forgetting everything in her desire to help, darted forward; the door swung open, and, "It is beautiful inside," she called. The child's eyes lit up, she lifted her hand to the latch and Nora found a little companion beside her.

She turned in question to the beautiful Be-

ing, who answered "You forgot *yourself*, and therefore gained the power to help and find your companion beside you; because, though when seen from the *outside* when things are separate, the houses seem many, when in the *inside* there is *Unity*. You find there is but one Palace, and one Queen, though the doors be many whereby one may enter in."

"And now," continued the Radiant Queen tenderly, "they have heard the harmony, and it is time that the children of the Queen helped others."

The light grew very bright, and Nora opened her eyes to find the morning sun streaming on her face. Ah, this is what is wrong with the world! People have forgotten that their real work is to help others. But she had heard the harmony of Unity and Self-forgetfulness, and she knew that it sounds in the hearts of all and can be heard when the din of the brazen trumpets is silent, and the sound of the beating drums is still.

"I will try so to live that I may help others to understand this," said Nora. E. I. W.

### Alvilda

**T**HERE is a story, said to be known to every boy and girl living in Norway.

A great story-writer wrote it down so that boys and girls everywhere might read it. It is a story about a little girl and a big brown bear.

Alvilda is the name the great story-writer gives to the little girl. It was her fifth birthday, and her brothers and sisters planned a picnic in the woods. Some of the neighbors' children joined them and there were twelve in the party when it started out. Alvilda was the smallest, and when they reached the woods they made a litter of pine branches and carried her on it, as they were going too far for her to walk; and besides it was her birthday.

They filled their baskets full of wild strawberries as they went through the woods, and they gathered lilies and violets and maiden-hair. At last they stopped to rest, but not for long, as the boys were eager to go fishing. They left the big girls with Alvilda, and went to find the stream which they knew was not far off. Alvilda being a little girl and pretty sleepy, curled herself up on a mossy little mound and took a nap. The big girls heard the boys shouting with glee, and curious to see what they had caught, hastily covered Alvilda with a shawl and went to find the boys.

After a while Alvilda woke, and found herself alone—no, not alone, for not far from her she saw a big brown bear. Perhaps his coming had awakened her. At first she was afraid; but then she remembered that some bears are very good and gentle. So she went up to the bear and stroked his neck and told him very pleasantly that she had seen a picture of just such a bear as he, in a book. Bruin did not seem to be much interested in this. Strawberries were more to his taste. He gobbled up all they had gathered except what were in Alvilda's little basket. Alvilda then thought she would make a wreath for

the bear. She did this, weaving vines and flowers into a beautiful large one which she put over his head.

By this time the boys and girls were hurrying back, thinking they had left Alvilda long enough to have a good nap. In fact they had stayed a little too long, they thought, and came rushing back to find her. The bear heard the noise they made. He turned quickly and ran off into the deep woods.

When Alvilda told them what had happened the boys and girls were very much frightened. At first they thought Alvilda had been dreaming, but the berries were gone, and the flowers also, and Alvilda was sure she had been awake and entertained a real bear. They all hurried home, thankful that she was safe, and ready to give up any more adventures for that day.

Six months later, in the heart of winter, the children saw a great brown bear on a sled; he had been taken in the woods by hunters. On his neck hung a wreath of withered flowers. When Alvilda saw it she cried: "It is my bear, my brown bear who came while I was asleep in the forest. See the wreath which I made for him!" After this, every one believed Alvilda's story of the bear.

MARIANNE

### The Cuckoo

**T**HE cuckoo is a bird that lives in the leafy green woods of Europe and Asia.

The coat of the cuckoo is a soft gray, and it has a fan-like tail. Its breast is marked with waving white lines. The cuckoo looks something like the turtledove. Like the turtledove, the cuckoo has a way of repeating over and over again two pretty notes. The cuckoo says "cuck-oo," and this gives him his name.

The cuckoo family has one queer habit. The birds do not build their own nests. They lay their eggs in the nests of other birds. As soon as some mother-bird leaves her nest for a little while, the cuckoo, who is watching near by for the chance, slips in and lays an egg in the nest. She never puts more than one egg in any nest. Usually the cuckoo's egg is so much like the mother-bird's eggs in color, size and marking that she cannot tell the stranger egg from her own.

In winter the cuckoos fly south to northern Africa. When summer comes again they usually go back to the same place where they were the summer before.

The cuckoo, like the lark, is a herald of the dawn. When the darkness of night first begins to grow pale, the cuckoo feels it and wakens. "Cuck-oo!" he calls joyously, over and over again, even before the cock has wakened the morning echoes with his clear "cock-a-doodle-doo." When the sun appears above the horizon, the cuckoo is overjoyed, and all agog with the glorious news, he repeats his "cuck-oo" more than a hundred times. B.

In Japan every year there is an interesting musical contest. The singers are not men and women, nor boys and girls, but birds—nightingales. Each nightingale sings in turn and a judge awards the prize. G.

itarian work. All who assist in this work are directly helping that cause.

# THE MYSTERIES OF THE HEART DOCTRINE

Prepared by  
**KATHERINE TINGLEY**  
AND HER PUPILS

## *The Theosophical book of the Twentieth century*

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1.25 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

Order now from  
**THE THEOSOPHICAL PUBLISHING COMPANY**  
POINT LOMA, CAL.

## **SOME OF THE ERRORS OF CHRISTIAN SCIENCE CRITICISM**

by **H. P. Blavatsky and William Q. Judge**

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"  
A Note of Warning

—by **H. P. Blavatsky**

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by **William Q. Judge**

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its *rational*, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

## Spiritual and Psychic

THE acquisition of new powers over nature does not necessarily tend to the increased welfare of humanity, either collectively or individually; for these powers may be abused; and as long as there is lack of wisdom, they will be turned to detrimental purposes. This rule may also apply to physical science with its inventions, such as newspapers, telegraphs, explosives, and drugs; but the immediate purpose here is to apply it to what is known as "psychism."

Few care to deny nowadays that the reality of superphysical powers in man is established; but whether these few deny it or not, the fact remains, and its misuse will constitute a grave menace to civilization. For the one salient characteristic which all branches of psychism have in common is this—that they inspire little if any motive for the safe or beneficent use of the powers of which they treat. The appeal is to ambition, curiosity, and desire. These powers are offered freely to all, including those who do not even profess unselfish motives; whereas safety demands that they should be withheld even from those who do profess unselfish motives, until they shall have been able to prove the sincerity of their professions and their ability to live up to them.

The placing of new powers within the reach of humanity, as we know it to be, is surely a most foolish proceeding; and the results are every day apparent in the increase of idiotic crazes and various forms of nervous disease and mental unbalance.

The great ignorance which prevails concerning such matters is equally evident. For instance, a leader writer in a prominent paper speaks of "the cure of physical ills by purely spiritual or psychical methods." This seems to a Theosophist as if a doctor were to tell his patient to take "one of the chlorides of mercury—calomel or corrosive sublimate, either one"; or attempt to cure physical ills with electricity from a battery or a powerhouse. The words "spiritual" and "psychical" are popularly used vaguely to denote absolutely all of human nature except the purely physical, and the idea that any discrimination is necessary does not occur to the user.

As the powers to be invoked are of a far subtler order than electricity, chemical forces, etc., the risk attending the ignorant dabbling with them may be imagined. The sensitiveness of the human make-up, and the powerlessness of the average human being of today

to control his own appetites or of his body to resist disease, show what danger he incurs by stirring up unknown forces that were sleeping.

A knowledge of Theosophy is urgently needed to show people that there is a profound distinction between spiritual and psychic. Briefly speaking, human nature is divided into two parts—the animal, and the spiritual; the conscious discriminative mind of man occupies an intermediate position between these two, its destiny being to become united to its Divine Counterpart, the Spiritual Essence, and to raise the lower nature to the level of being a purified and useful instrument. But the lower nature continually strives to drag man downward towards selfishness and passion.

The point is that not only the body, but several other principles beyond it, belong to this lower or animal nature of man and are as conscienceless as the body itself. The psychic nature is not moral; in it dwell powerful lusts, the very roots of those which manifest themselves in the body as desires; from them we are protected by the grossness of the body, but with this protection removed they may easily become strong enough to overwhelm us. Hence these psychics are as a rule but awakening the powerful forces of their own animal nature and rendering themselves sensitive and susceptible to the dangerous influences that permeate the invisible worlds.

The Spiritual is antipodal to the psychic; its whole atmosphere breathes of unselfishness and freedom from desire and concupiscence of every kind. It is known by devotion to duty and service. It confers powers of a far higher and more powerful order than any psychic ones. While psychic powers can only lead their owner into worse snares in his struggles with himself, spiritual powers can give him the ability and discernment by which he may order his life to his own true happiness and that of those around him. These spiritual powers are sufficiently well described in the Christian Bible, but the Churches seem to lack power to vivify these teachings and bring them home to the people.

The whole of Theosophical literature abounds with warnings on the necessity of distinguishing between Spiritual and psychic. The doctrine of Theosophy is called the "Heart-Doctrine," because it is based on the central secrets of life, and its breath is Compassion.

Thus, while the churches and some scientists are playing with the psychic movements

and revealing their ignorance of inner laws and incompetence as guides in such matters to the people, Theosophy stands in the position of interpreter of the eternal Laws of Righteousness, and is the only visible champion of Wisdom and of the Power that is based on Wisdom.

### Theosophy and Buddhism

ANSWERING a correspondent's question respecting Gautama Buddha and the picture of him given in Sir Edwin Arnold's *Light of Asia*, *Uncle Remus's Magazine* remarks that Buddhism has a number of branches and that *Theosophy is one of them*.

That is not true. Though we have many reasons for believing that the Buddha Gautama taught to his immediate disciples a doctrine which is identical with Theosophy, and though there are men who have received and preserved that Master's teachings in their completeness, it does not therefore follow that Theosophy is identical with what today is called Buddhism, identical with the body of teachings current among the millions bearing the name of Buddhists, noble and impersonal as that body of teachings certainly is, taken as a whole.

For good reasons pertaining to the current thought of his day and people, Gautama in his public sermons intentionally left the question of the human soul almost undealt with, and to his disciples he gave his reasons for the omission. He was content that every ethical precept he uttered should tacitly imply the existence of, and call into action, the inner Center it did not explicitly name.

The western consciousness of today is not that of old India, and Theosophy takes a much fuller public expression.

According to popular Buddhism, the elements that go to make up a *personality* (or vehicles—not necessarily the *individuality*) break asunder at death. That *personality* or vehicle is then therefore no more existent than is a mosaic pattern when the bits of the mosaic have been taken apart. Reincarnation is the coming together again of those elements to form a new pattern which is very nearly the old one.

This in part is Theosophy, which, however, among other things, adds that *soul*, ego, the Karmic focus or Center, stands in the midst of those elements, preserves in its memory the aroma of the experiences of life, and, when rebirth comes, is the magnet that attracts once more about itself the personal elements that were about it in the previous life. The same elements, "skandhas" on one side, the same soul-self on the other.

The process of waking in the morning is not altogether dissimilar to the process of reincarnation. Only in this case the skandhas *awake* to bodily activity instead of *gathering together anew*. The motor centers of the body begin to stir; one by one the bodily desires come up into consciousness. Memory awakens, memory of business, of something pleasant or unpleasant that is to come today, of the thoughts of last night, of the book last read. Finally the whole physical, mental, and moral personality has come into play. Man can do with his body as he wills; he can think of what he likes; stop thinking of what he wishes to let go; remember or suspend memory; desire and not desire at will; permit

what hopes, anticipations, antagonisms, and friendlinesses he will; follow an ideal eternally upward or be a slave. He can let the elements of his make-up be clogs, or transform them into wings. And when he faces them once again at the opening of a life, they are as he left them at the close of the last, just as he is this morning what he left himself last night. The pattern is not a new one.

Theosophy is the key to the Buddhism of the Buddhist peoples.

### The Rainbow as a Symbol

WITH the Greeks the rainbow was poetically a bridge of the gods, over which Iris, the swift-footed messenger, passed to and fro, doing their errands. With the Norsemen, it was the same; Bifrost stretched between Midgård (the earth) and Asgård, the white city of the gods; and during the last days of Midgård it would be destroyed. The souls of the mighty alone could cross this bridge, for Valhalla was shut against the deedless; and the heroes were greeted by the horn of Heimdall, summoning the gods. Heimdall was the watchman stationed to prevent the giants from forcing their way over the bridge. "Though the rainbow reaches Asgård no longer," says a writer, "and the horn of the warder is silent, yet the old belief with its poetic imagery remains one of the most beautiful in mythology." Yes, but why does it remain and why is it so beautiful? Shall we accept a modern theory of artistic beauty and regard it with Macaulay as "an illusion produced upon the imagination"? Shall we believe that all fairy tales and romantic legends are things which we fondly wish could be but which can never be, and that the world has always been able to create imaginary images and scenes of beauty, which have no counterpart in reality and never have had, but which nevertheless sufficed to console the world? No: we answer that the imagination is unable to create all these beautiful things out of nothing, and that they have a root in actualities, things which do exist in an inner realm where the inner eye perceives, and may once have existed also in the outer world. This is why they are beautiful: they recall to the memory of the Soul, as Plato says, reminiscences of that which it knew in its unfettered state and will know again when it overcomes the trammels of subjection to the senses and desires.

In Irish lore

Where the rainbow strikes the ground  
There the crock of gold is found.

And the golden cup at the end of the rainbow, and the *Regenbogenschüssellein*, are familiar to English and Germans. Another variation says that a pair of slippers lies buried there, and to him who finds them comes his heart's desire. Under the rainbow the earth gives forth a sweet odor, and he who prays beneath the arch may be sure that his prayer goes to God. Superstitious wisecracks who take things literally must be puzzled as to how one may reach the end of the rainbow or stand under its arch, and we fancy we hear their learned puzzlings; just as they have wondered how the alchemists managed to take the moon out of the sky and wash it, and why the New Jerusalem will not overbalance the pivots of the earth with its stupendous proportions.

Students of the Hebrew Bible will remember that the god who sends the deluge sets his bow in the sky, after the flood is over, as a sign that he will no more visit mankind with such a calamity.

In old symbology we find cosmic phenomena used as symbols of human life, and events in human life used as symbols of cosmic phenomena. The earth is spoken of as a Being, having organs and vital functions; the gods and heroes seem emblematic of the sun and other heavenly bodies. It has been imagined by pedants, and the notion is not yet dead, that all the vast and world-wide machinery of symbolic myths was invented for the sole purpose of describing "in a poetic way" well known cosmic phenomena—the solar myth theory, in short. But one item of ancient knowledge was that there is a close correspondence between the organism of man and that of the earth on which he lives, and between the drama of his life and that of the world's life. Hence the two are inseparably blended and it is scarcely possible to say, or appropriate to attempt to say, whether one or the other was being referred to, since it was almost always both. The key to understanding these symbols lies in a recognition of this fact of the analogy between the macrocosm and the microcosm. Otherwise they will seem so many absurd fables.

The rainbow bridge is that over which man has to pass from the lower sense-world of delusion and tribulation to the heaven-world of purification and divine wisdom. Its prismatic colors, seven in number, have their meaning for the student of Occultism. On the bridge a watchful guardian is set to prevent the "giants" from the lower world trespassing; the giants are ever represented as trying to scale heaven and as being frustrated. So must a man leave behind the giant forces of the personality ere he can enter the abode of immortality. But this was more than a mere symbolical way of describing the Soul's pilgrimage by figures drawn from terrestrial phenomena. There is a rainbow somewhere in the human make-up, and this is the one where the golden cup and the magic slippers are.

### Halley's Comet

THIS great historical comet, which is to reappear in 1910, has a variable period, owing to the perturbations exercised upon it by Saturn and Jupiter. This period varies from 79 to 74.5 years. Its orbit is very elongated; at perihelion it is nearer to the Sun than is Venus, while at aphelion it reaches a distance from the sun of 35 times that of the Earth, being then farther than Neptune. Historical appearances have been noted back to 451 A. D., with certainty in some cases and high probability in others. At each perihelion return it has been visible to the naked eye, often as a splendid or terrible apparition. In 1066 it created universal dread throughout Europe, and in England was regarded as a presage of the Norman invasion. In 1145, according to Chinese records, it had a tail 10° long. In 1456 it occupied a space nearly 70° in length and was visible for a month.

It is now between the orbits of Jupiter and Saturn and will be within the distance of Jupiter's orbit after March 1, 1909. Perihelion is reached in April or May.

# Some Views on XXth Century Problems

## The Poet's Work

A READER of poetry, moved by what he reads, would do well to take trouble enough to understand the means by which the effect has been wrought on him. Most people are a good deal moved by Tennyson's lines:

Break, break, break,  
On thy cold gray stones, O Sea!

but they do not note the many threads of consciousness that have been drawn upon. Each *break* occupies a whole bar, the three words filling the time of a line. The long vowel can therefore be weighted with utmost feeling, and the word may be followed by a little stretch of silence during which the feeling may as it were *eat in*.

The sea wave is not at once introduced; it is not at once *that* that breaks. The threads that lead to the memory of *all* things that break, are drawn; first, hearts that break; then all other things that in breaking end. Loss, ruin, finis—is already there when the second line begins.

Then come three words whose keynote is prepared for them, *cold, gray*, the cold grayness of *stones*. Greenness, life, light, action, are not merely absent but positively absent, walled away by their opposites.

And then the whole picture suddenly concretes into the dull gray shore with the heavy wave bearing in upon it. Everything has the gray chill of autumn.

Poe tells us how he built up *The Raven*. No one ever believed him, believed that he reasoned the thing through, making intellect and conscious choice do the work of swift intuition and feeling. Despairing gloom was his mood, and intuition seized the verbally pictorial furniture in which to set it. Did he calmly decide that a raven and not a parrot or a poodle was the fitting animal? Did he *reason* that a stormy midnight and not a bright spring morning was the proper hour?

People speak of both nature and the poet as creator. If it is not metaphor in one case, it is not in the other; is not the process the same? If an eye is to be evolved in an eyeless creature, has not the blind thing first an urge, a feeling, a desire for better, clearer, closer contact with its surroundings? This feeling, guiding the operative forces, causes them to seize the necessary elements and build them little by little, into a seeing eye. And the poet, assembling the necessary elements in his consciousness to express a feeling, those elements that are embodied in the words of his verse, has acquired or bettered an *inner* eye for the seeing of subtle things and phases in nature and the soul. This is creation, to make the subjective manifest through some sort of organ, body, or vesture, fine or gross, to make it objective on some plane. The power we call genius. People read poetry and hear music in order to get their own inner eyes and ears created or bettered. They too have the urge for expression in an organ. But they have too little of the instinctive power to assemble the elements, and so they grate-

fully accept and assimilate the work of the poet and musician.

They have, however, some of it, and in the course of their growth they will have it in perfection. One day the earth and the air will be filled with the living forms that the artist and musician and poet humanity of that time will have poured into them. STUDENT

## The Christian Citadel

THE (London) *Nation*, commenting on the recent Pan-Anglican Congress in that city, says:

A general attack on the critical method was everywhere severely discountenanced. A few years ago any oration could draw approving cheers from such multitudes by cheap sneers and denunciations of those "higher critics" who had disproved the Flood, or dissected the Pentateuch, or divided Daniel into fragments. Today, such attempts, when essayed, evoked no corresponding general approval. The audiences were revealed as representing a community, cautious, reserved, anxious as to the ultimate results of criticism of the Bible, clinging desperately and often defiantly to faiths and affirmations which have long been regarded as sacred.

Why the "desperation" and the "defiance"? Why not let the Higher Criticism have anything it wants, Flood, Pentateuch, Daniel, Virgin Birth, Miracles, Resurrection? A Teacher did come, bringing and embodying his message. Can that fact be dissected away? There is no need for the *No!* to be uttered in the slightest desperation or defiance. Why do the desperate defiers believe in that Teacher and the Light he embodied? Because he worked miracles? If that is really the sole root of their belief, then the desperation is indeed natural. Do they believe because he spoke good words? But other men have spoken similar and often identical words.

Why do not these poor besieged people abandon their outworks and gather in close for the defense of their central citadel? If they would do that they would find that the citadel needed no defense. If the best of them will look closely into themselves so as to know what is that in which they really wish to believe, and do believe, they will find that it needs no historic defense, cannot essentially profit by one, and cannot even be touched by a historic attack. That there is, behind all world-phenomena, a Light of Life, the moving Heart of all things, whose essence is compassion: that it can be known and attained by all men:—is not this the attack-defying essential? Why do they believe it? Apart from futile historical argument, they do not seem able to give any other answer than that they do believe it, do know it. Why not say that they believe it because some of that same Light of Life is in their own—and all men's—heart; and it is witnessing to itself?

What stands in the way now? Perhaps something not very respectable: Other peoples have dared to claim that some pure-souled son of themselves has also reached up to this Light, embodied it, and taught from it and of it. And that can never be admitted! There is a Light of Life, but in all the ages of history it never showed itself until 2000 years ago. Amid all the mighty peoples of antiquity it

remained silent, reserving itself for the appearance of a little race in Palestine.

It is these corollaries—no real corollaries at all—that are suffocating the two great truths the Christians have. If they will go back to the two, they will find themselves able to advance to a host of others long ignored, and for the first time they will really understand Christ. STUDENT

## Science Material and Spiritual

A CONGREGATIONALIST minister, writing in *The Outlook* on a now tolerably common subject, the decline in ministerial candidates, thinks that they would flock to the colleges if they had the prospect of being taught more.

A man who is to be a "maker and mender of men" must know the *normal* man, physically, psychically, and socially. In other words, the first thing he must do is to master the sciences of biology, anthropology, psychology, pedagogy, ethics, sociology, and history. He must become thoroughly acquainted with the life of Jesus, in its human as well as divine aspects, for here alone is to be found the concrete example of the *perfect* Man.

"Seek ye first the Kingdom of Heaven and"—all these sciences ye may then add, if they then seem profitable.

Might not a knave and hypocrite, even an utter villain, become past-master in them all, including such fragments as are known of the life of Jesus in its human aspect?

But the divine aspect? But how is a man to know that divine aspect except by his *own* divine aspect?

In other words this formidable mass of studies should *follow* something uncomprehendingly touched, merely, in the last clause—self-knowledge. Body, soul, and spirit, said Paul, are we. Is the human individual "spirit" to be known, to be brought into daily consciousness, through any of that study? Mind, through which the study is to be done, is the mediator between the purely sensuous and sensual, the animal, and the "spirit." Is this spirit a mere pious feeling; or is it a divine entity, first-born of the eternal light, one for each man, standing watching, as much above the mind as that is above the *passional* animal? Surely the first duty of mind, the mind that would teach others, is to saturate itself with conscious knowledge of this presence! Yet such knowledge is not named in the curriculum! No knowledge of the divine aspect of the life of Jesus will come until that preliminary is at any rate well entered upon, for he was a man who had fully won that union, whose mind was conscious of and in this presence. Mentally, his divine and human lives were one.

Students will not be attracted to the religious colleges until they begin to feel that there are men there who by meditation and self-discipline have won this transcendental knowledge. Nor will congregations be attracted to the words of the products of the colleges until in their turn they feel that these men have such real knowledge and can speak of the things of spirit as men having authority, men whose diploma is in their being. # Archaeology Palaeontology Ethnology

## The "Blacksmiths" of Ancient Egypt

THE immense age of civilization in Egypt is a hard nut for those to crack who are obsessed by the curious desire to limit the age of man on earth to as few thousand years as possible, as if ashamed of the limited progress that humanity as a whole has made. Surely if there were any doubt of the psychological power of thought it would be dispelled by observing the effect of the erroneous ecclesiastical teaching that the earth was created only six thousand years ago. Though Geology has exploded that myth, yet even those thinkers who believe themselves

untrammelled by superstitious beliefs resist the idea that man has resided more than a comparatively few thousands of years on earth.

But mere prejudice will not change facts; ceaseless researches are being made in Egypt; about its mysteries new books and theories, good, bad, and indifferent are continually appearing; and it is interesting to the Theosophical student to watch the dissatisfaction expressed in some of them with many of the limited and prosaic theories hitherto popular, and to see that among the best archaeologists there is a growing respect for the wisdom of the Egyptians and a closer trend towards the Theosophical position.

In *The Secret Doctrine* H. P. Blavatsky lays great stress upon the enormous antiquity of Egypt, instancing the three separate positions of the sign Virgo in the planisphere of the temple of Denderah as testimony to the Egyptian knowledge of three precessional periods at least, of 25,868 years each, and hinting that the Great Pyramid may be as old as the earliest of these periods. And it is worth noticing as a sign of the times that a recent writer has just pointed out the improbability of the Great Pyramid—certain essential proportions of which are characterized by such extremely perfect workmanship as to be almost inimitable by us today—having been built by the ordinary people of the known historic period. He infers that it was erected (and by specially trained builders) one, two, or more precessional periods before the year 2170 B. C., i. e., at one of the previous times when the then Pole Star, *Alpha Draconis*, would have shone down the descending passage leading inward. Be this as it may, according to the Theosophical records, parts of Egypt have been for untold ages the home of a race that could in no sense be called bar-

Lomaland Photo. and Engraving Dept.

MONOLITHS: WATERVILLE, COUNTY KERRY, IRELAND

baric, and at some period unknown there came amongst them an incursion bringing new customs, probably from India. In support of this H. P. Blavatsky gives this quotation from Kullûka-Bhatta, an ancient Indian historian:

"Under the reign of Viśvâmitra, first king of the Dynasty of Soma-Vanga, in consequence of a battle which lasted five days, Manu-Vina, heir of the ancient kings, being abandoned by the Brâhmanas, emigrated with all his companions, passing through Arya, and the countries of Barria, till he came to the shores of Masra." (*Isis Unveiled*, vol. I, p. 627)

And she goes on to say:

Arya is Eran (Persia); Barria is Arabia, and Masra was the name of Cairo, which to this day is called *Masr*, *Musr*, and *Misro*.

Mizraim was the Hebrew name for the land of Cham—Egypt. The learned Brugsch Bey expresses his

firm conviction that the Egyptians came from Asia long before the historical period, having traversed the Suez promontory, that bridge of all the nations, and found a new fatherland on the banks of the Nile.

The most recent research has modified this view. Dr. E. A. Wallace Budge, keeper of the Egyptian and Assyrian antiquities in the British Museum, one of the highest authorities of the day, expresses the opinion that a series of carvings on the walls of the temple of Edfû

represent the invaders in prehistoric times, who made their way into Egypt, from a country in the East, by way of the Red Sea, and by some road across the eastern desert, e. g., that through the Wâdi Hammâmât, or that which touches the Nile a little to the south of Thebes. . . . In later times the indigenous priesthoods merged the legendary history of the deified king of the blacksmiths in that of Horus, the god of heaven in the earliest times, and in that of Râ which belonged to a later period. (*The Gods of the Egyptians*, 1904)

The story is far older than the temple of

Edfû on whose walls it is found inscribed, and runs to the following effect. A rebellion arose against the god Râ in Nubia, who sent his son Horus (Heru-Behutet) to attack the enemy. Horus chased them all over Egypt and at last gained the victory after a great deal of trouble. It seems that the shaven-headed warrior hosts who fought on the side of Horus were armed with weapons of metal and with chains, and were also expert builders. They are known as the "Blacksmiths."

Maspero admitted a historical basis for the legend, and Dr. Budge's contention that it is founded on facts so far removed in time as

to have allowed the actors to have become identified with the gods and spiritual powers, seems quite likely from the clues given by H. P. Blavatsky.

In connexion with the fact that Egypt is said by the Theosophical teachers to be older than India, it may be remarked that the "India" of today is only a small part of what was formerly known as such; in the larger sense, as H. P. Blavatsky says, the name in the archaic ages included Tibet, Mongolia, Great Tartary, and much more. Secondly, Egypt has probably had more than one civilization in cyclic succession. There are vague traditions that the sea once submerged and once surrounded the Pyramids, which if true, would prove an extraordinary antiquity for them.

STUDENT

## Monoliths

"RUDE Stone Monuments" are classed as: (1) *Menhirs*, isolated monoliths set on end; (2) *Alignments*, the same in lines; (3) *Cromlechs*, the same in circles, ovals, or irregular enclosures; (4) *Dolmens*, where the upright monoliths have cap-stones. They are found in France, where there are 1600 menhirs recorded; in Great Britain and Ireland; in Scandinavia, Algeria, Morocco, India, Central Asia, America, and many other countries. They are often of gigantic size; that of Locmariaquer in Brittany being a monolith whose original length was 67 feet and weight 382 tons, being of *foreign granite*.

The unity of plan over so large an area shows that they were erected by people who made a tour of the world for that purpose, while the size of the blocks raised attests the power and science of the builders—the second sub-race of the (present) Fifth Root-Race, men of gigantic stature, commissioned to set up lasting witnesses to the past. # ✻ The Trend of Twentieth Century Science ✻

## A Generous Botanist

TO find a front-rank botanist permitting plants to be conscious, is exceedingly refreshing, a refreshment we get from Dr. Macdougall, Director of the Department of Botanical Research of the Carnegie Institute of Washington. The permission is given as follows in the *Scientific American*:

In no instance, however, does the activity of the plant involve choice or decision, or anything except the most generalized form of consciousness.

The permission is a little grudging, and the grudge may be questioned. Has he ever noticed sweet peas selecting between wire and string to climb by? Or, when there is only wire provided, touching it, trying, waiting, swaying in the breeze till one of them boldly grasps it, and then climbing by that one?

Plants are now known to have several senses, some of them extraordinarily acute.

They have sight and eyes, the eyes being certain cells scattered over the leaf blade. These cells have a lens to concentrate the light upon their inner surface. If the light falls obliquely upon the leaf, some of it is reflected and wasted. The leaf, therefore, presently moves so as to bring its surface to a right angle with the light. In the oblique position, some of the rays passing through the lens have not gone straight down through the eye-cell into the deeper layers of the leaf; instead of going through the transparent bottom of the eye-cell cup, opposite the lens, they have struck the sides. These sides are exquisitely sensitive to light, and from them the leaf now knows that it has to move. If there be two lights, say two candles in an otherwise dark cellar, the leaf knows which of them is the stronger and adjusts itself to that one. It has been found, says Dr. Macdougall, that if one be but one three-hundred-thousandth stronger, to that the plant will turn. This is a perfection of light-vision to which no animal eye can lay any claim. These same eyes are also sensitive to color, selecting some colors to respond to and ignoring others. A recent observer has also detected a distinct image of a near object at the bottom of the eye-cup; but it is certainly doubtful if the plant's *consciousness* accepts or makes use of that.

The plant has the same sense of position as we have, and through the same mechanism. In the deeper parts of our ears are three semi-circular canals in the bone, lined with delicate membrane, one for each dimension of space. They contain fluid and in the fluid are some minute granules. With eyes shut, we know our uprightness or inclination by these granules. For with every movement between the vertical and the horizontal they lie over upon a different spot of the membrane. Plants also have such cells, lined with sensitive membrane, and filled with fluid containing granules.

To the plants' sense of touch we have already referred. Everybody knows of the sensitive plant. In the case of climbing plants, the sense may be limited to the tendrils and even to one side of these and even to certain touch cells thereon comparable to the touch

cells of our own finger tips. This sense also may be so much more sensitive than the touch of animals that the tendril will detect fine particles of chalk suspended in water and respond to them, or to a fragment of silk not a fiftieth of a grain in weight.

Definite nerves do not seem to have been yet detected. But equivalent tracts must exist, and possibly co-ordinating centers; for a stimulus falling upon a leaf will cause movement of response even of part of the stem to it which is attached. And the failure of all attempts to explain the ascent and circulation of sap as purely passive, strongly suggests that there is a contractile circulatory mechanism, a heart-power so to speak, diffused through all the active cells of trunk and stem.

"It is to be seen, therefore," sums up Dr. Macdougall, "that plants are not degenerates, nor are they lower than animals in any sense: . . ." And no one who loves and cultivates them will fail to perceive that they have an intelligence which is exactly adequate to their selected mode of life. STUDENT

## What are Mirages?

THERE is a group of mirages, now abundantly evidenced, which the current explanations do not explain, which indeed they avoid very carefully. One now and then gets a newspaper paragraph of description and then one hears no more. The explanation of the absence of explanation is doubtless that these cases defy explanation. Is it too bold to accept the challenge?

Here is a typical case, taken from a recent *Manchester Guardian*. It was observed between Glossop and Hayfield. The reporter relates that he was on the top of one of the hills near the Glossop Observatory when he saw what looked like a great stretch of water behind the Cown rocks about a mile away. On its right it ended in a sand beach. Many farming people saw it, some of them with considerable alarm, and they all watched it till its disappearance about half an hour after.

As we said, there are enough of such cases to establish the existence of a group, not coming under the explanation of any known law.

The characteristics of this particular group are, that the pictures are out of key with existing scenery, that there is no such scenery near enough for them to be cloud reflections, that they are not reversed, that they are seen identically by a number of people, and that they endure for a definite time.

We would suggest that they are temporary revivifications of the ancient scenery of the place where they occur. Under what circumstances this invisible writing on the scrolls of space comes into view, we do not know.

Everywhere where now is land once rolled the sea; here and there over the earth the sands of great deserts cover the unsuspected ruins of ancient cities. Theosophy teaches, and science in its borderland excursions begins to suspect, that the earth (like man) has her astral pictorial memory of all the changes of her surface. May not these occasionally pass into visibility near their site? STUDENT

## How Many Senses?

THE recent International Conference of the Blind, at Manchester, England, developed the theory of a sixth sense. This was defined by Mr. Ritchie as a power possessed by the blind, enabling them to perceive objects and persons at some distance. He regarded it as a combination of touch and hearing. For the temperature of furniture, walls and human bodies is rarely exactly that of the air; human bodies, with their respiration and circulation, are continuous generators of faint sound; and if the air be in motion it is reflected from every surface.

Mr. Illingworth, however, principal of Henshaw's asylum for the blind, stood out for another sense *sui generis*. Everyone has it, he thought; but it only becomes operative where hearing and sight are absent. It is as if we were sight without an eye. In the life of the blind, and in their education, it aids, he said, the thought-transference, which goes on between them and their interlocutors.

It may be remembered that all the senses are specializations of the sense of touch, and that each is capable of very much finer work than we ordinarily exact of it. Reichenbach found that a certain proportion of people, kept absolutely from the light for a number of hours, could see as light the lines of force about the poles of magnets and crystals. Moreover the sense organs are all acute differentiations of skin and are the work of consciousness endeavoring to come closer and more comprehendingly into touch with the world, differentiating the crude mass of sensation. Under special circumstances it might try that again and get a great deal of knowledge out of fine sensation which in other cases would go unnoticed—say the fall of light on the palm. The *real* sixth sense is this act of understanding of what the skin and sense-organs bring in. STUDENT

## A Brainy Plant

CAPTAIN MUSGRAVE, well known for his work during the Boer war, has been making a twenty months mule trip through Columbia, keeping his eye open for new things in botany and zoology. Perhaps his most important capture is a plant with an unquestioned nervous system co-ordinated by a ganglion serving as a brain. The digestive organs are also very elaborate.

Plants behave as if they had nervous systems and even co-ordinating centers; but it is doubtful if, so far, these have been anatomically located. Captain Musgrave's plants may show us how to search in the others. One would suppose that the place to examine for a possible brain center would be about the plane of junction of stem and roots.

Young students of botany are usually taught that the cells of plants are little chambers perfectly closed in. As a matter of fact their walls contain minute pores through which the almost fluid protoplasm streams from cell to cell, all being thus in intercommunication. Protoplasm is conductile, and that impulses travel from cell to cell is well known. W.

## Lessons in Forestry

FRANCE, Japan, and Prussia appear to have fully learned the lesson in forestry which Mr. Pinchot and his staff, backed by President Roosevelt, are trying to impress upon us. It is not only that wasteful destruction of trees means a lumber famine, now almost upon us. A treed area holds its soil, and it holds the rain. The valleys and mesas below are watered with graduated and gently filtered streams instead of flooded with the instant washings of naked hills. A treed hill is a sponge, absorbing all the rain it receives and delivering it in normal and manageable amount.

The valley of Summer Lake, in Southern Oregon, reads us a valuable lesson. Three or four springs there unite to make the Ana river which feeds the lake. The region where they rise is semi-arid and whether the season be wet or dry their flow is nearly constant. Where do they get their water—which, by the way, is of high temperature? This fact, indeed, suggested the solution of the problem. North and west of them is a well treed, mountainous region, whose soil rests on porous rock. The detained rainfall percolates through the soil and infiltrates the rock, finally reaching a depth, as judged by the temperature, of 1000 feet. Thence it reissues as the three springs.

When the Prussian government turned its eye upon the forestry question it found a state of things somewhat like our own. There had been a wasteful destruction which threatened a famine. It was decided to replant and care for the bared districts by means of the funds yielded by those still treed. Altogether there were 7,000,000 acres. Notwithstanding that the yield of timber is now three times what it was in 1830, no more is cut than the forests replace. The danger of famine appears, in fact, to be over, and a continued and increasing supply assured.

Japan has 21,000,000 woodlots, occupying rough, poor, and otherwise useless ground. But they do not let anything be useless in that country. The soil and water is consequently saved and the areas are made to contribute to the general welfare. The wood cut is less than can be replaced and the yearly replanting is said to amount to 500,000,000 trees. Why cannot we use up some of our poor land in the same way?

France, like Prussia, found herself facing a serious situation. Rich

AUSTRALIA

areas, bereft of timber, had had the soil washed away. Torrents had replaced streams; millions of acres had been rendered nearly worthless. All this is being properly rectified and a real danger to the wealth of the country averted.

As for ourselves, we have perhaps awakened in time, but not a moment too soon. The Forestry Department at present represents a sort of material conscience. It stands as an emblem of the creative power of unselfish effort. Let us support it. STUDENT

## Pennsylvania's Coal Resources

IN the production of both anthracite and bituminous coal, Pennsylvania in 1907 exceeded any previous annual record. The amount was close on 236 million short tons, of which 85½ million was anthracite. In 1906 the amount was about 200 million. Pennsylvania until 1902 produced more than half the coal mined in the United States, but since then its proportion has been less than half. It produces more coal than any other single state or country in the world except Great Britain, having in 1907 for the first time exceeded Germany. It exceeds the combined production of all foreign countries except Great Britain and Germany.

A Government expert estimates the original amount of coal in Pennsylvania at 112,574,000,000 short tons bituminous, and 21,000,000,000 anthracite. By former methods of anthracite mining, it is said, for every ton marketed, 1½ tons were wasted or left in the ground as pillars. This wastage has been reduced, but up to 1907 the exhaustion has probably amounted to double the production. Assuming that we go on wasting one ton for every ton produced, there would be enough anthracite left to last one century at the 1907 rate of production. Of soft coal, in which there is less waste, the amount is estimated to last, at present rate of consumption, 490 years. T.

## Making Silver into Gold

HOW to make gold from silver is what Sir William Ramsay is experimenting on now, according to a report of an interview he had in France. He described how he had caused radium emanation to transmute copper into another metal of the same series but of inferior atomic weight; and considered that the emanation ought also to be able

to transmute a metal into one of higher atomic weight, as for instance silver to gold, on which he was now experimenting. He mentioned two metals as intervening between silver and gold in the series, one of them *caesium* and the other an unknown element which has been named *argentaurum*, and these two would be the stages in the transmutation. But it would not be a profitable way of making gold. As a scientific achievement it would, however, be considered as a triumph the value of which scarcely can be estimated in commercial terms. H.

## From THE LONGEST DAY

Wordsworth

THUS when thou with Time hast traveled  
Toward the mighty gulf of things,  
And in the mazy stream unraveled  
With thy best imaginings;  
Think if thou on beauty leanest,  
Think how pitiful that stay,  
Did not virtue give the meanest  
Charms superior to decay.

## Economy

WE ordinarily use the word "economy" to signify a careful prudence in use; or, as we might term it, a mild form of miserliness; but the true meaning of the word is very closely akin to righteousness which Jesus considered of so much importance that he pronounced a special blessing upon the righteous person. Considered in this larger and more correct sense, economy is much more than the saving of material or care in the use of money. It is rather the art of getting the most result from the least expenditure of effort by oneself or anyone else. It may save your own self trouble to throw the scrap of paper or other litter by the roadside, but someone else has to pick it up, so that all taken together your economy of time was actual waste of effort.

The true spirit of altruistic economy is the living desire that everything shall move to its proper place in the easiest, smoothest, and most direct way possible; a desire so strong that we will submit to personal loss of goods and labor to facilitate thereby some affair of greater and more general benefit than our own personal interest. Taken in this truer meaning economy is a divine impulse and merges into that devotion to human welfare which we call the Higher Patriotism.

Every action is economical which helps to render greater forces available. Like everything else it has the positive and negative sides; to which latter the word has become almost entirely confined. The merely not wasting is that negative and lesser side of economy; the positive and greater side is the constant effort to place every effort we make and all the material we handle, how and where it will be most effective for good. The particulars of any certain case may place all the cost upon us and confer all the benefits upon someone else, but the truly economical man will overlook all that and be content if the net result is a benefit to humanity. RALPH WYTHEBOURNE

## Economy from a Theosophical Standpoint

SO many when they hear the word economy immediately think of saving money, and to the majority this is the all-important thing in life: getting it and saving it, storing it up in banks and vaults, for fear they may sometime come to want. And so men pinch and save, with this one purpose in mind.

You may hear one say: "I have just turned my last year's dress and bought a new flower for my hat, and they look almost as good as new." Or another will say: "I guess with new buttons on my coat and brushing and pressing it will go another season and I will have saved *so much*." It is this selfish idea of the meaning of economy that limits our horizon; we see only the personal I magnified and forget the dressmaker, milliner, and tailor also have to make a living, and that it may be economy to help them.

Economy means distribution or due order of things, and carried out rightly will create harmony; and we should apply it to all of the departments of life, physically, mentally, and morally. "Cast thy bread upon the waters, it will return to thee after many days," is good economy. The economy of time and strength is of far greater importance than the mere saving of money. "Robbing Peter to pay Paul," and "burning out candle at both ends," are very poor economy. If we would become all-round men and women as nature meant us to be we must have a broader understanding of the meaning of this word.

Many people work so hard in their mistaken idea of saving, they grow to be very disagreeable and hard to live with, no comfort to themselves or anybody else. A man may have millions and yet be poor—poor in spirit, for when he dies he can take nothing with him of all that he strove for most in life. "All you can hold in your cold dead hand is the things you have given away." Love, compassion, and charity for others—these are the things that abide and enrich the soul with permanent riches. True economy broadens and expands our whole nature, and rightly understood and applied would regenerate the world, for it is Brotherhood. M. A. S.

## Rise and Fall of Nations

(From the writings of William Q. Judge)

THE rise and decay of nations and civilizations, the total extinction of nations, demand an explanation found nowhere but in Reincarnation. . . . Races die out because the Egos have had enough of the experience that sort of race gives. So we find the Red Indian, the Hottentot, the Easter Islanders and others as examples of races deserted by high Egos, and as they are dying away other souls who have had no higher life in the past enter into the bodies of the race to go on using them for the purpose of gaining such experience as the race body will give. . . . A time comes when the whole mass of Egos which built up the race leaves it for another physical environment more like themselves. The economy of Nature will not permit the physical race to suddenly fade away, and so in the real order of evolution other and less progressed egos come in and use the forms provided, keeping up the production of bodies, but less and less in number each century. These lower Egos are not able to keep up to the limit of the capacity of the congeries of energies left by the other Egos, and so while the new set gains as much experience as is possible the race in time dies out after passing through its decay. . . . China itself is in process of decay, she being now in the almost stationary stage just before the rush downward. Great civilizations like those of Egypt and Babylon have gone because the souls who

made them have long ago reincarnated in the great conquering nations of Europe and the present American Continents. As nations and races they have been totally reincarnated and born again for higher and greater purposes than ever.

A NATION may have heaped up against its account as a nation a vast amount of bad Karma. Its fate is sure, and although it may have noble units in it, great souls who are even Adepts themselves, nothing can save it, and it will go out "like a torch dipped in water." Such was the end of ancient Egypt. . . . She gradually reached a high point of power and then her people grew material; the Helpers of Humanity retired; pretended ones took their place, and gradually her glory waned. The same story was repeated in Chaldaea and Assyria and also upon the surface of our great America. . . . Among the great Sages the rise and fall of nations and civilizations are studied under the great cyclic movements. . . . the cycles in their movement are bringing up to the surface now, in the United States and in America generally, not only a great glory of civilization which was forgotten eleven thousand or more years ago, but also the very men, the monads—the egos, as they call them—who were concerned so many years since in developing and bringing it to its final lustre.

THE old Aztec and other ancient American peoples died out because their own Karma—the result of their own life as nations in the far past—fell upon and destroyed them. With nations this heavy operation of Karma is always through famine, war, convulsion of nature, and the sterility of the women of the nation. The latter cause comes near the end and sweeps the whole remnant away. . . . The whole mass of Egos must go on incarnating and reincarnating in the nation or race until they have all worked out to the end the causes set up. Though the nation may for a time disappear as a physical thing, the Egos that made it do not leave the world, but come out as the makers of some new nation in which they must go on with the task and take either punishment or reward as accords with their Karma. Of this law the old Egyptians are an illustration. They certainly rose to a high point of development, and as certainly they were extinguished as a nation. But the souls—the old Egos—live on and are now fulfilling their self-made destiny as some other nation now in our period. They may be the new American nation or the Jews fated to wander up and down in the world and suffer much at the hands of others. This process is perfectly just.

HEREDITY as the great rule and as a complete explanation is absolutely overthrown by history, which shows no constant transmission of learning, power, capacity. For instance, in the case of the ancient Egyptians long gone and their line of transmission shattered, we have no transmission to their descendants.

WE have all lived and taken part in civilization after civilization, race after race, on earth, and will so continue.

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** If Universal Brotherhood is a fact in nature, as taught by Theosophy, why is it that some persons feel instinctively repelled by others, and why is there the difference in power and thought that we see manifested in different people?

**Answer** Here we have the argument for Theosophy as against ethics alone, and those who say that the sole ethical statement is enough for the world. Let one go forth in the morning with these ideals of conduct alone, and some sentimental conviction within him that his attitude should be brotherly; and likely enough his whole resolution will be crumpled up and withered away before noon, if not by the first man he meets. *What sentiment will stand against this?—The fellow is loathsome to me; the turn of his head, his walk, a certain unhuman tang in his voice—all convince me of the falsity of this brotherhood I brought out with me to business* (not that we ever put it to ourselves with such frank candor). *Why can't he do this? Why can't he do that?*—and all the while the Universe is shouting out to ourselves the greatest *why* of all—Why do we not mind our own business, and govern each his own household of thoughts?

But Theosophy is an understanding fed by life, and all one's days and moments go to certify it. Brotherhood is no sentiment of that kind; it causes no lapsing into laxity; it is no indulgence of the mind, no softness to set you singing or purring with contentment. We have grown to ask nothing of our beliefs but that they should be a solace for us, quieting fears and so soothing difficulties which we ought to conquer. Brotherhood does not stoop to that. It is a matter for the will, a tocsin against *laissez faire*—a fact in nature. The whole universe works together towards its own vast god-known ends; stars and planets move, not selfishly, but in just proportion; there is a "thus far shalt thou go" for every one of them—a no farther, and a no less far. Yet must the harmony be always extended or deepened in its sphere. It is one thing to have reconciled atom to atom, and made star and star each exert its own due pull and counter-pull that the spacial equipoise may be maintained; it is quite another to have forced fractious and angular mankind into mutual toleration. For when we became human, it is as if the Law had said to us. *You are now my full-grown sons; you have come of age and I will no longer compel you; choose which way you will go.* So

"Men only disagree, of creatures rational," and men only walk wilfully of all creatures that exist. The brute must have a master, and follows part Nature, and part Man, who has grown to be a kind of counter-loadstone. But to all human beings, sooner or later, will come the compulsory exertion of deliberate choice. This way is open—choose it if you will. The consequences? Oh, you shall find them in your time; they are destruction, desolation, to be salutorily damned for the time being. Yes, there are consequences enough and to spare—but take that way if you desire to. No seraph army shall hinder you. And the other? From that, peace. You will not, following it,

in any way infringe upon the universal tranquility. There is more excitement in the former road? Well, try it if you will; heaven and earth and the middle regions are waiting for you to make your choice and go forward. There is no compulsion, but there is a readjustment and readjustment, and evermore readjustment, and attendant pain, which verily does amount to compulsion in this sense—that sooner or later the most mulish devotee of evil will sicken and turn. The husks which the swine do eat will be too bitter for his feeding, and he will remember the honest food at home, which seemed so tame in the old days. Any doctrine in itself true, becomes false when dragged from its place and set among other falsities. Brotherhood without the other teachings of Theosophy is to some a stumbling-block and to others folly.

What is there strange in this repulsion, seeing that we have for many ages exercised our choice as we do now, day by day; electing to be unbrotherly, unnatural; *i. e.*, not consonant with natural law. We have worked up hatreds of old, and given and received injuries—and take up the results of these now, whenever we meet one of our old time opponents. The knowledge of Reincarnation gives the only sane sanction to brotherhood. That it is merely written in the ordinances of extra-cosmic deity, is apt to be forgotten here in this cosmos—and not unrightly forgotten, nor unnaturally. But that it is the deepest part of our own nature—how, if we were taught to know that, should we flout it as we do now?

And it is Reincarnation also that answers the second part of the question and shows how the differences as well as the disharmonies have grown. The teaching is not that all souls are alike, but that they naturally harmonize and fit in with each other. You could get no harmony from the piano if all the notes on the keyboard gave one and the same sound, as the middle C; and it is harmony the Universal will have from us, and not monotone. We began by being unlike, each with an individuality of his own; and so we shall end. Some of us have taken pains to learn our lessons by the way, some have been enterprising; others have been sluggish and timid. So some have great power, and some almost none at all.

Brotherhood does not mean equality, and it does not mean similarity. If you sent a dozen reapers into your field, they would not all reap the same square yard of corn. It may be that in this universe there is a field that no one can reap but yourself, and that each of us has such a field, which would go unreaped and wasted unless he himself reaped it. Q. R.

**Question** Has Theosophy any explanation for the many coincidences that occur in the lives of most people? What explanation does it offer?

**Answer** Often when two events occur simultaneously without our being able to see any possible correlation between them we attempt to explain the whole matter by saying that it is a coincidence. We are usually satisfied when we have so declared it. We have given it a name and that ends it, just like so many other so-called explanations. Or we may perhaps say that it was simply accidental that these things did happen together: another name. At times, of course, such

things have a very different meaning from what the first appearance would indicate, the real connexion being in quite another direction, but there is much in this world which passes under the name of accident or coincidence which has a cause so near that we fail to see it from its very nearness.

The universe is governed by law, of that we are certain. To understand all the intricate workings of that law is another matter. Being governed by law, however, there is clearly no room for accident, for accidents presuppose the absence of law. If so-called accidents were followed from cause to cause they would be seen to be based on the same immutable justice which is otherwise so clearly demonstrated throughout all nature. Much of the working of the law is so obscure as to baffle all ordinary investigation; but many of the events of life can be seen to follow at least some law, however incomprehensible the law itself may be.

One of these laws is that generally known as the "law of averages." It furnishes a better indication of the universality of law than perhaps anything else, just because all we can see is that it exists. We cannot see how it works, but we can see its results, and also that were it not for this law all would be chaos.

Did you ever stop to think how it is that people do not all travel on one day and none the next? Day after day the amount of travel is the same, on our streets, on our highways, on our railways. On certain days in the week it may be more than on others, but these very differences, constantly recurring in a regular order, accentuate still more the working of the law. Special occasions also draw special crowds, but then the connexion is easily seen. It is the steadiness of the everyday average which is harder to account for.

Did you ever think of our earth and the solar system as if they were great beings, alive as you and I are alive, and with all the functions of organic life just as are found in ourselves? In ourselves we know that the blood circulates throughout our whole system, the little corpuscles rapidly moving from the heart to the remotest parts of the body and back again, steadily doing their work, constantly urged to it by the great central force which springs from the heart. So we may liken the people traveling through the land to this blood stream. They too are traveling along great arteries, some going to the remotest corners of the world, each on his mission and each consciously or unconsciously working to keep the world alive. They too are urged on by the beats of the great heart, the heart of the world and the heart of our solar system. There are many wheels within wheels, but in each case there is a conscious guidance back of all; and in what we may in the past have called "coincidence" or "accident" we may learn to see sign-posts directing our attention to some of the deeper aspects of law. E. T. S.

THE mere fact of dying is not of itself enough to bring about development of faculties or the elimination of wrong tendency and inclination. If we assume that upon entering heaven we at once acquire all knowledge and purity, then that state after death is reduced to a dead level and life itself with all its discipline is shorn of every meaning.—W. Q. Judge

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

## Hearth-Fires

IT has been well said that the home is the unit of society, and that the decay of the home is the beginning of decay for the nation.

The sacredness of the home is a cherished ideal of Theosophists; and it is especially emphasized by Katherine Tingley, the present Theosophical Leader.

Looking back to one's earlier life, one finds a curious mixture of sacred memories and things one had rather not remember. The institution is absolutely sacred—that one feels deeply; yet in how many respects was the sanctity violated by lapses from the ideal! Perhaps the father and mother were lifelong strangers to one another, never having succeeded, even after long years of that intimate association, in understanding each other's characters. Thus in such case there was no true union and no basis for the growth of a healthy family life. Held together by ties of law and custom, they constituted a kind of suppressed discord, eternally jarring in secret; and the jar diffused itself and mirrored itself in children with discordant strains in their temperament and with unaccountable antipathies to each other.

There are so many elements in home life that one scarcely knows with which to begin. The whole institution is in a tangle. We have not, save in rare instances, the true ideal of marriage. Comradeship in a high purpose, free from emotionalism and sordid motives, is hard to find where there is such a lack of definite ideals in life. But where each cherishes the lofty and yet intensely practical ideals of Theosophy, the condition may be fulfilled. The proposed relationship, however, is one that demands great self-mastery and watchfulness on both sides, to guard against those weaknesses of human nature which spoil so many marriages. Harmony, reserve, and self-respect are the great essentials.

It would be a happy day if the sanctity of the home could be restored; but we need to restore some forgotten ancient ideas. We read that the ancients believed in the existence of a sacred Fire, which they always kept alive, and carried with them wherever the family went. Also we read of "household gods," Lares and Penates, who were venerated, to whom "sacrifices" were made, and who were carefully preserved and carried about.

## MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

All these traditions have been smeared over by the tracks of those who sneer at what they cannot understand, and the very language in which they are described desecrates them.

This outer fire was the symbol of the inner spiritual Fire in which these people believed. The real connexion between the symbol and that which it symbolizes is still admitted by us in our acts, though we do not understand why we do them. We celebrate wedlock by the bestowal of a ring, dedication to religion by the aspersion of water, communion with the Divine Unity by a symbolic repast. We baptize ships, bless foundation stones, and in many other ways show our intuitive recognition of the meaning of such ceremonies. When, therefore, we find that other peoples used to celebrate the unity of their home by similar ceremonies, we have no right (in the name of common sense and logic) to dub them superstitious.

All these symbols and ceremonies owe their efficacy (which, as just said, we Westerners admit) to the fact that there are inner realities corresponding to them. The bestowal of the ring, the circle, indicated as a symbol that a new unity had been formed, an actual process of union taking place interiorly. When the water is sprinkled on the infant, it is commonly believed by Christians that a power is conferred on it spiritually. The ancients believed—say, rather, knew—that the various individuals constituting a family, became, under the right conditions, blended into a new being, a unity in spirit, and this was the household "god" they venerated and for whose perpetuation they observed the ceremonies.

In these days of abstractions we must speak of "keeping alive the spirit of the home," which may mean something practically if it means little philosophically. We can at least understand that there may exist a kind of mental or spiritual atmosphere in a home, which would be violated, not only by wrong acts, but even by wrong thoughts. Wrong

thoughts, cherished in secret, would disturb this harmony and the disturbance would be felt by all the members and would react injuriously throughout. There could be a common agreement to maintain the integrity of this spirit and to refrain from violating it in such ways. In this way the home and the family would be real and sacred.

When several people unite, a new entity is called into being which is more potent than the sum of the separate personalities. Some great orator has declared that the nation is merely the aggregate of its citizens—that is, it was for him a mere form of words. The nation is an entity. In the same way the truly united family is an entity and something more than the mere aggregate of its units.

Those who in the professed interests of unity, would destroy the family, prove by their views that in their minds the family has become a cause of disunion. This it should not and need not be. If it were a real center of harmony, it could diffuse nothing but harmony all around it. Exclusiveness is not a true characteristic of the family; but hospitality is. In the home we have a golden opportunity to fulfil our best instincts by organizing a rightly governed kingdom on a scale commensurate with our abilities but infinitely potent as a saving power wherever its influence can extend.

H. T.

## The National Conservation Commission

THE work of the Commission should be conditioned upon keeping ever in mind the great fact that the life of the nation depends absolutely on the material resources, which have already made the nation great. Our object is to conserve the foundations of our prosperity. We intend to use these resources, but to so use them as to conserve them. No effort should be made to limit the wise and proper development and application of these resources; every effort should be made to prevent destruction, to reduce waste, and to distribute the enjoyment of our national wealth in such a way as to promote the greatest good of the greatest number for the longest time. . . . The proper co-ordination of our resources is a prime requisite. . . . There is no break between the interests of state and nation, these interests are essentially one."—Theodore Roosevelt

## THE THEOSOPHICAL ADDRESS AT ISIS THEATER

A LARGE audience was again present at the Isis Theater last Sunday evening at the meeting of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY. Mrs. Marjorie Tyberg had been announced to speak but was unable to be present, and her paper "What is the World Calling For," was read instead by Miss Elizabeth Bonn.

The speaker began with a quotation from the writings of H. P. Blavatsky: "The human heart has not yet fully uttered itself." She said that the heart speaks to us at times, but the impulses that come from it of self-forgetfulness and love for others, have a way of losing their energy before being expressed in action. Taking the world as it is, what are the things, the speaker asked, that give you pain and grief when you see or hear them? Sick uncared-for little children, boys and girls growing up in evil ways, or with no higher ideals than lives of self-indulgence or to gratify ambition and pride. You ask why these things should be—they are the result of the past truly, but why should there not be hope for the future? Why should not men and women be taught to build on new lines?

Doubtless each one, if asked what is the world calling for? would have a different answer, depending on his point of view, but how many answers would be merely expressions of the cry of the personal desires instead of the real heart-cry from the soul of humanity? Those things most desired by the personal nature will never satisfy. The things of mind and sense are transitory, and it is indeed short-sighted and foolish, to say the least, to regard these only and never make acquaintance with the real self and real life.

There is a power in the world which is gradually changing the current of the world's thought, which does answer the real heart-cry of the world, of old and young, for knowledge of the inner life, a call for brotherhood, for sympathy and mutual helpfulness; and that power is Theosophy. It has been given expression by the three Leaders of the Theosophical Movement, H. P. Blavatsky, William Q. Judge, and Katherine Tingley; and through their lives and teachings, and through the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY is answer made to the heart-cry of humanity.

The music of the evening was furnished by students of the Isis Conservatory. OBSERVER

### The New French Salon

AT the inauguration of the Salon of Poetry President Harancourt said:

Poetry is no longer read? No matter. We will keep on writing it, writing it without end! . . . Who is there among you who has not felt himself a poet, if only for an hour? Ransack your memories and dare to say that this hour was not the most delicious hour of your lives, from the mere fact that it was enthusiastic! Nothing, after all, is worth while but untrammelled self-expression. One does not always succeed in it, . . . but it suffices to have attempted it, to cherish in the depth of one's own being a spring floweret which smells sweet during one's whole life. . . . We are the past, it is true, but we are your past. We remain that which you were, and we resemble you still when you no longer resemble yourselves. Come, recognize yourselves in us! Our verses are the mirrors of your dead emotions, and in this Salon of Poetry the pictures we expose are your souls. STUDENT

## Sven Hedin Visits Lake Mānasasarovara and Discovers a Range 2000 Miles Long

DR. SVEN HEDIN has written in *Harper's Magazine* for August an account of his recent journeys and discoveries in Tibet.

He has discovered an entirely new range of mountains, 2000 miles long!

He has visited the shores of the sacred Lake Mānasasarovara and sailed on its waters.

Hedin seems to have been able to go where others could not. He also seems to possess amiable qualities, though he denies it himself, which others do not. Perhaps the two things may be connected. Certainly one gathers from his writings that he finds himself able to enter into the ideas and feelings of his hosts, and to realize that, however valuable may be the traditions of one's own race and land, there are other races and lands having other traditions. Of some travelers one might ask, "What went ye out for to see?" feeling fairly

Shut in between two of the greatest mountains in the world, Kailas in the north, and Gurla-Mandhata in the south, and between the chains from which these mountains raise their heads crowned with dazzling eternal snow, stretches out the holy lake, almost round in form, and nearly 25 kilometers in diameter. I was often near weeping from joy at the sight of this wonderful landscape of surpassing grandeur, and I cherished a secret hope to be able one day to describe it in words for others, to be able in my insignificance to utter a feeble and faltering word of praise to the Almighty.

He asks how Mānasasarovara and Kailās came to be objects of veneration in two such different religions as Hindūism and Lāmaism. Let us make an apposite quotation from the writings of H. P. Blavatsky:

The Vedas, Brāhmanism, and along with these Sanskrit, were importations into what we now regard as India. They were never indigenous to its soil. There was a time when the ancient nations of the West included under the generic name of India many of the countries of Asia now classified under other names. There was an Upper, a Lower,

### A THEOSOPHIST AT HOME IN JAPAN

The cut shows a bit of Japanese Nature-Gardening

sure that the answer would represent that which they actually did see. But of this traveler one would ask, "What didst thou see?" For he seems to have been ready to see whatever there might be to see. The description given by some travelers of sacred spots might be summed up in the words, "Haw, haw, don't you know." But Hedin is impressed with their sacredness.

We went down and camped by the edge of the holy lake Manasarowar, the most holy and the most famous of all the lakes in the world, the goal of countless Hindu pilgrims' welfare and desire, a lake which has been celebrated in religious hymns ever since the time of the Vedas, and a lake which, even by the followers of the Lamas, is looked upon as the home of the gods!

He received letters from Hindūs begging him to explore this lake and the holy mountain Kailās (Kang-Rimpoche) on its north, and telling him that, if he could give them a description, they would always continue to remember him in their prayers.

and a Western India, even during the comparatively late period of Alexander; and Persia (Irān) is called Western India in some ancient classics. The countries now named Tibet, Mongolia, and Great Tartary, were considered by them as forming part of India. When we say, therefore, that India has civilized the world, and was the *Alma Mater* of the civilizations, arts, and sciences of all other nations (Babylonia, and perhaps even Egypt, included) we mean archaic, pre-historic India, India of the time when the great Gobi was a sea, and the lost "Atlantis" formed part of an unbroken continent which began at the Himālayas and ran down over Southern India, Ceylon, and Java, to far-away Tasmania.—*Five Years of Theosophy*, "The Sevenfold Principle in Man," Appendix, Note II.

Many other passages might be quoted in illustration of the point that all this part of Asia was in remote times the home of a civilization that radiated light and wisdom to the whole world, and whose knowledge was the source of the mysterious symbolism and religious philosophy which we find scattered among the nations descended from it. The feelings of both Brāhmins and Lāmaists carry

them back to times remoter than the origin of their present religions. They still preserve traditions of the scenes enacted on those sacred shores in the pure air of those heights, when the Sacred Knowledge was still known among men.

About the great range discovered, Dr. Hedin says that previously it was thought the great central lakes were the sources of the Brahmaputra's northern tributaries, and that the country was flat. But in reality there is a range of mountains, one of the highest in the world. Its existence was suspected by one explorer, and others have crossed parts of it without knowing that it was all one. There is no name for the range as a whole. It has a total length of 2000 miles; the average height of the passes is greater than in the Himālayas, but the peaks do not tower so high. E.

### The Planets Uranus and Neptune and the Origin of the Solar System

INTERESTING information—some of it negative,—has just been obtained from an attempt to identify the absorption bands, shown by the spectroscope, of the atmospheres of the four giant planets—Jupiter, Saturn, Uranus, and Neptune—with those of our terrestrial elements. The spectra of these planets were carefully photographed by Mr. Slipper of the Flagstaff Observatory, Arizona, beside that of the solar light derived from the moon when at the same altitude, etc., and they have been recently discussed in the scientific magazines.

The results of the investigation have confirmed the supposition that those planets which are telescopically similar possess similar spectra. Thus the spectra of Jupiter and Saturn are closely allied, while the spectrum of Uranus bears a strong resemblance to that of Neptune. Singularly enough, the spectrum of Saturn's ring shows none of the peculiarities presented by that of the planet itself. None of the absorption bands of Saturn can be identified with those of the earth's atmosphere. A striking, and, from the generally accepted scientific standpoint, mysterious feature of Saturn's make-up, is that the vapor of water is entirely absent from that planet so far as close observations, which are very complete, can show.

The spectrum of Neptune's atmosphere is quite remarkable, for a considerable portion of the solar spectrum reflected by that planet is so changed as to be quite unrecognizable. The spectra of Uranus and Neptune both show the presence of great quantities of hydrogen, an element almost absent from our atmosphere. Although the absorption bands are well developed in the photographs and have been exhaustively analysed nothing but the hydrogen in the two outermost planets has been identified, a fact of interest to the student of Theosophy.

It has long been held by astronomers that in all probability some of the planets are passing through, and that some have gone through, a life history very similar to that which geologists claim for the earth, *i. e.*, a nebulous stage concentrating into the liquid and vaporous, followed by the present conditions of solid, liquid, and vaporous; and according to the general belief the primitive nebula out of which the Solar System grew was fairly uni-

form in constitution. The manner in which the separate planets condensed is still an unsolved problem in mathematics; the original Nebular Theory of Laplace being now abandoned, as H. P. Blavatsky said it would have to be. But under any hypothesis of uniformity in the original nebula we should expect to find the least dense planets, such as the four outer giants, which have tremendously deep atmospheres, showing close similarity to the supposed condition of the earth in primeval times when the "oceans were suspended in the atmosphere in the form of steam." But these recent spectroscopic observations give no support to this; on the contrary they present strong evidence that the planets mentioned, and especially Uranus and Neptune, are quite different in composition, and possibly in origin, from the earth and the rest of the smaller ones. H. P. Blavatsky gives considerable attention in *The Secret Doctrine* and elsewhere to the profoundly interesting questions of cosmology, and advances many illuminating suggestions towards their solution derived from her Teachers and from a deep study of the ancient Oriental philosophies, and in connexion with our subject she says:

The Sun and planets are only co-uterine brothers, having the same nebular origin, but in a different mode from that presented by modern astronomy.

She gives a definite hint as to the method by which the primitive nebula was separated into portions which ultimately became planets. Quoting from the *Book of Dzyan*:

*The Central Sun causes Fohat to collect primordial dust in the form of balls, to impel them to move in converging lines and finally to approach each other and aggregate. . . . Being scattered in Space, without order or system, the world-germs come into frequent collision until their final aggregation, after which they become wanderers (Comets). Then the battles and struggles begin. The older (bodies) attract the younger, while others repel them. Many perish, devoured by their stronger companions. Those that escape become worlds.—(Vol. I, page 201)*

According to H. P. Blavatsky the genesis of planets is symbolized by an Eastern ceremony called the "Festival of the Fires."

Seven ascetics appear on the threshold of the temple with seven lighted sticks of incense. At the light of these the first row of pilgrims light their incense sticks. After which every ascetic begins whirling his stick around his head in space, and furnishes the rest with fire. Thus with the heavenly bodies. A laya center is lighted and awakened into life by the fires of another "pilgrim" after which the new "center" rushes into space and becomes a comet.—(*Ibid.* page 203)

In referring to the fact that the immense distance of Uranus and Neptune from the Sun almost entirely precludes their dependence on him for light and heat (Neptune for instance receives about 900 times less than the earth), H. P. Blavatsky says that Neptune cannot properly be regarded as a member of the Solar System, and she hints that Uranus is loosely connected with the planetary family within his orbit. Curiously enough Bode's famous harmonic law of planetary distances breaks down when applied to Neptune.

While the newest spectroscopic researches seem to demonstrate the existence of something unique in the constitution of Uranus and Neptune, we must always be on guard against attaching finality to spectroscopic observations alone and unsupported by other evidence. As every ray of light has to pass through the crucible of our atmosphere before we can ana-

lyse it, unsuspected modifications may be produced in spite of all precautions, which would alter our deductions if known. Clerk-Maxwell wrote:

For actually comparing and discriminating the spectra of two bodies they should be examined under identical states of temperature, pressure, and all other physical conditions.

Can we apply the physical conditions of substances in the planets to the elements in our laboratories? Hardly; and when we recollect that the outermost planets are so far distant that our greatest telescopes show no definite markings upon their minute disks, so that we do not even know their speed of rotation, the difficulty of the problem will be clearer. Probably the conditions prevailing upon Neptune and Uranus are quite inconceivable to us, for as we approach the further confines of our system the phenomena shown by the planets become more and more singular and unfamiliar. For instance, though Mars presents a somewhat similar aspect to that of the Earth, the problems it offers are still unsolved, and when we reach further out to Jupiter, and then to Saturn, the enigmas become still more bewildering.

Not only does Saturn, although wrapped in the folds of an enormously energetic atmosphere, show no signs of water vapor, which would naturally be looked for if its conditions at all resembled those of the Earth in former periods, but certain zones or broad bands are found to be moving from West to East at a terrific speed relatively to the rest of the planet. The North Temperate Zone takes about 24 minutes less time to rotate than the equatorial spots! As Saturn's equatorial rotation is about 10 hours the ceaseless rush of the cloudy whirlwind must fly at over 600 miles an hour! What a strange world this one fact suggests!

### Tides in the Solid Earth

IN a recent paper before the Philosophical Society of Washington was a summary of the latest observations on the daily deflections of the plumb-line. The experiments referred to were mainly those of Dr. Hecker at Potsdam, who used two delicately mounted horizontal pendulums in a chamber twenty-five meters below the surface, the experiments lasting through a period of twenty-eight months. After various sources of error had been carefully eliminated, the semi-diurnal terms were found to have fairly uniform and consistent values, which for the influences of both sun and moon were found to be about two-thirds of the deflections which would be due to those orbs were the earth absolutely rigid. Were the earth non-rigid and homogeneous, a change in the equipotential surface would result from the attractions of sun and moon during the earth's daily rotation, and no pendulum movement would occur. The experiments have thus shown that the solid part of the earth yields under the influences of the sun's and moon's attractions, to an extent comparable with the rigidity of a steel globe. Yet the rocks of the earth's crust have only one-tenth the compressive, and less than one-hundredth of the tensile strength of steel, so it would seem there must be other causes, unknown to science, for the extraordinary stability of the earth's crust. # Art Music Literature and the Drama

Grieg—Norway's Greatest Musical Composer  
(CONCLUDED FROM LAST ISSUE)

IN the year 1876 Grieg married his cousin, Nina Haggerup, who was a true help and inspiration to him as long as he lived. It was largely owing to her that his genius assumed such a strong bent towards lyric song; for he composed many of his best known songs for her, which she interpreted as no one else could.

Madame Grieg accompanied her husband on his concert tours, singing his songs with the greatest success. Her earnest and heartfelt singing, together with the exquisite accompaniments played by her husband, had the effect of a wonderful improvisation, and produced a powerful impression upon all who heard them, although neither one of them had what we would today call finished technique. These gifted comrades were so imbued with the spirit of their work, and there was such a remarkable sympathy and charm in their performances, however, that technical limitations were forgotten. One critic remarked after hearing one of these song recitals, that although certain mistakes were noticeable in the opening bars, "no one ever observed errors in the latter part of Madame Grieg's songs!"

Madame Grieg was not only a fine singer, but also a true companion; bright, gentle, and cheerful. Their married life was a rare and beautiful example of mutual helpfulness, and reminds one of the happy relationship which existed between those noble souls, Robert and Clara Schumann.

Grieg's own playing was remarkable for its emotional intensity. He appeared in several European cities as piano soloist, also as conductor of his own works. A heavy cart having once run over and injured one of his hands, he was never a brilliant technician; yet the fire of his genius always carried his audience beyond the notes, and he rendered his own compositions in a way which no one else could approach. What an encouraging contrast this is to the mere technicians who so bind themselves to attaining mechanical perfection that the real message of music is lost sight of!

As an orchestra director Grieg was profoundly inspiring to his men; even to those who were unacquainted with his methods. He seemed to have the power of imbuing them with his ideas, and obtaining response to his musical feeling and enthusiasm.

No musician of our time, excepting Paderewski, has drawn such crowded houses as did Grieg at the concerts in which he took part. Unfortunately he never visited America. The state of his health forbade such a long journey, and he particularly dreaded the ocean voyage.

It is a great pity that this genius was unable to guard against physical breakdown. Much of great value has been lost to the world owing to the shortened lives or continued ill health of some of its most gifted men. Some with feeble bodies have striven nobly on and

produced great works while laboring under tremendous difficulties; but how much more could have been accomplished had there been the physical basis which Katherine Tingley is establishing in her educational system!

Wagner, during his most brilliant period, could work only two hours daily, owing to eye strain! Grieg also was very limited as to his time for composition. He was in constant demand for concerts, yet could give only about a dozen in a year, and these only by husbanding his strength. His letters testify that he would have written many more works in the larger forms had his strength permitted. For forty-seven years he lived and worked with only one lung! Fortunately his wife was always a great help to him.

Edvard Grieg's greatness expressed itself not only in his music, but in his character as well. His Viking ancestry made him simple yet forceful. He was of a retiring disposition, and had a strong aversion to anything like posing; yet he was genial and cultured, and always treated visitors with true courtesy. He retained his keen intelligence and cheerful disposition in spite of his poor health; was a noble husband, a helper of aspiring artists, and an ardent patriot, always taking an active interest in the welfare of his country.

Although Grieg attained great popularity with the French, yet, such was his love of justice, that he unhesitatingly sacrificed it at the time of the Dreyfus trial, because of the unjust verdict, and refused to appear in Paris in concert during that time.

Everyone loves Grieg's music. It appeals both to the musician and the general public because it contains true beauty. He wrote for the voice, piano, violin, and the orchestra. While some of his music is exceedingly difficult, much of it is of medium grade, especially that for the piano.

The *Peer Gynt Suite* for orchestra, written as incidental music to Ibsen's drama of that name, is perhaps his most famous orchestral work, and is known the world over. Especially fine are his three violin and piano sonatas, full of rugged breadth, fine melodies and subtle, beautiful harmonies. They abound in technical angularities, but when conquered are genuinely refreshing and delightful. His songs, however, are considered by some to be his masterpieces. They contain melodies of rare freshness and beauty, and are rich in poetic and emotional contents. Their style is entirely original.

Folk-song melodies largely permeate Grieg's music; sometimes directly, but also indirectly. He has been unjustly accused of borrowing his melodies, but on this point the public has been misinformed. Ninety-five per cent of Grieg's music is entirely his own; even into his borrowed tunes he has infused his own originality. The bold, strange harmonies and wild rhythm stamp them immediately as Grieg's. Art and the folk-song were never better united.

The Norwegian atmosphere is ever present in his music. One feels his sympathy for the

aspects and moods of nature. The rugged scenery, clear air and sparkling blue waters of Norway are woven delicately but inseparably into the tones of his noble works.

What an imagination he must have had! The weird fancies expressed in the flights of melody! The gayety and sadness of life, the tenderness of a human heart finds expression, and all the majesty and thunder of the storm. Although Grieg's music has such marked national characteristics he did *not* write in a dialect, but in a universal language which all can understand.

Edvard Grieg has always been the recipient of marked attention. The German Emperor while cruising in Norwegian waters, invited the composer to luncheon on board his private yacht, and he has often been the recipient of similar honors.

After his death musicians gathered from far and near to pay their respects to the memory of this great man. At the funeral, fifty-seven wreaths were laid down by delegates from the King and Queen of Norway, the German Emperor, the principal cities of Norway, and from the musical organizations throughout the world.

The body was cremated and on a wild and rocky promontory, in a cleft accessible only from the sea at low tide, and covered by a slab with a simple inscription, the ashes were buried.

TWO LOMALAND MUSICIANS

## Swedish Folk-Song

A CONGRESS, recently held in Stockholm for the promotion of the knowledge of the people, has taken up the question of saving the old songs, airs, and melodies still unrecorded. It was estimated that more than five thousand different songs of real value, many dating far back, might be recorded, if the work is started at once before the old generation has passed.

The part which music has played among the Swedish people may be seen by the fact that in one province only more than one thousand melodies have been recorded in the last year. The Swedish folk-songs have always been known for their singular beauty, and it is said that many of the airs and tunes now recorded will be a real surprise. The more this line of study broadens the more grows the impression that the life of the Northland really has been largely swayed by song and music in bygone days.

Skilled violin players have been very common in the outlying districts, many of them having learned the art "from the wind in the woods and the murmur of the water in the brooks, or the roar of the waterfalls," as they say. Some especially famous players of last century are said to have been instructed by the Neck or the Strömkarl.

In the light of these facts one's imagination reaches ahead to the vistas opening out before the Swedish people in the future, owing to Katherine Tingley's recent purchase of property on Visingsö and the establishing of a Rāja Yoga Center thereon.

#### 'Above Light, Below Life'

**A**BOVE Light, below Life," such is a Theosophical statement made by H. P. Blavatsky in relation to evolution as applied both to the universe and to man. Using the Hermetic axiom "As above so below," let us consider it in relation to our own natures.

Spirit is often described as "light," matter as "darkness," and "above" may be also taken to mean in an esoteric sense, "within," and "below" to equal "without." Now if we think, shall we not see that Spirit, or the Supreme, is *pure light*, while "life" would be, so to say, light shining through, or veiled by matter? And herein lies the Theosophical explanation of the unity of all life, and the necessity for altruism being applied as the universal solvent to the problems which face us as human beings. It is one of the eternal verities, that which true progress imperatively demands, that our actions agree with the ideal of brotherhood.

The nearer we consciously reach towards a conception of unity, the closer we draw towards absolute light, and receive true enlightenment. We are ourselves that absolute light, heirs to clear vision, when we rid ourselves of the wrappings of desire that now seem to be inseparable from our temporary abodes of flesh—provided by omnipotent Wisdom—the Higher Self—wherein we dwell, to wage war against, and conquer, the dark forces of ambition, greed, and lust, in order to let "our light so shine" that men may consciously recognize their divinity.

All light has its source "above" or "within," coming to us from the invisible realms of the Higher Self. While manifesting as "life" in material existence, it is towards re-union with that Bright Immortal Self that our aspirations should lead us and our efforts be directed. Unselfishness is the first and last step upon that pathway leading towards a conscious divinity, for it alone as motive power frees

the forces of determined Will and unlocks the portals of the Temple of Divine Wisdom. To re-become One with the All we must devote ourselves to the welfare of all in the desert of our temporary wandering in material sensuous existence—life in matter. "Above Light, below Life." EMILY T. WILLANS

#### School and Home

**A** WRITER in the London *Times*, who has studied American methods, thinks that the school, and not the home, is the great formative influence in American character. The home has lost its old-time discipline and is only too often a prey to indulgence and laxity; but in the school the influence is more towards discipline and self-dependence. Even in the school, however, there is grave danger that the spirit of coddling will intrude and exercise the same baneful influence as it has exercised in the home.

While the American family life has a pervasive quality of tender devotion and considerate courtesy unexcelled in any land, and the moral standards retain much of the potency of their puritanic origin, the puritanic severity has entirely disappeared from the family discipline; and in nearly every home in which I have been, whether of the rich or the poor, *the children were the masters of the house*, believing as a principle that everything turns upon them, and seeing, in any rare order that might come to limit their encroachments, an abuse of power, an arbitrary act. . . .

And I failed to understand how the children grew into law-abiding citizens until I left the home and went into the school. There I found them, by a rule which is impersonal and invariable—as a domestic rule should be—learning obedience, order, integrity in work, steadfastness in spite of moods, and submission to the rightful demand of the entire community upon each individual in order to the harmonious action of all.

Thus by a discipline that is ethical and is maintained during the formative years, the children acquire the social and civic habits, and are formed for liberty—not the false liberty allowed in the home, which, if unchecked in the school, would breed lawlessness and chaos, but the liberty of work, of service and of growth.

Eternal vigilance will, however, be required, thinks the writer, to prevent the growth of what he calls "paternalism" in the school. The children are supplied with free books in some grades, and even with free clothing in some States; and he was surprised that a proposal to provide free food and clothing was rejected merely on the ground of expense. This paternalism he considers a worse danger than the trusts, for it would breed a race of mannikins without independence; and already many think that in consequence of such tendencies, the educational system is threatening the virility of the nation.

To put the matter shortly—according to this idea, the home breeds a mischievous influence which the school labors to counteract; while the school, in its turn, is in danger of succumbing to the same mischievous influence. To describe this influence the word "paternalism" is chosen as the most appropriate, which shows to what extent the functions of a father must have become misunderstood. Is the relationship of a father, then, necessarily an injurious relationship?

In the home, we see, the will of the child is permitted to rule. This means that the will of the parents is weak and has given way. It is admitted that this state of affairs is most harmful to the child; therefore it must be inferred that the parents who tolerate it find themselves unable to do otherwise.

Every student of life knows that over-indulgence of children springs from the root of self-indulgence in one's own nature. The effort required to rebuke a self-willed child is distinctly an exercise of self-control and a triumph of the sense of duty over natural indolence. *Many parents shrink from this effort, as they shrink from denying themselves harmful luxuries or making efforts.* To vindicate their weakness, they resort in the half-unconscious hypocrisy of human nature, to various means for representing it as a virtue. We have even coteries that preach as a gospel

the leaving of the child to his own instincts!

The combination of weakness and kindness which goes by the name of paternalism is a mischievous alliance. It is the result of a materialistic philosophy of life diverting philanthropy into wrong channels. We are solicitous for the welfare of children. We look after all their physical comforts, give them separate desks, a lot of fine books, and so forth. But there are things of far greater importance to them than these physical comforts. There are things more important even than physical health, important though that is. Firmness of character, self-dependence, poise, emancipation from the thousand ills of a weak will—these are some of the things. Hence many children who are brought up in poverty turn out better because they have not been subjected to these weakening influences but have had to rely on themselves; and many a harsh parent does less harm by his severity than kind parents do by their so-called kindness.

But there is no need to be harsh. All we have to do is to *refrain from coddling*—which no healthy child really likes—from giving way to weaknesses and temper whether in ourselves or in the children, and from paying too much attention to the children. There is no need to rush to extremes and think that because one advocates discipline one is advocating severity. There is a proper balance, and many have found it. Consummate care is perfectly consistent with perfect discipline and with a freedom from undue admiration and pampering.

It is pitiable to see a naturally healthy and happy child gradually being filled up with self-importance and self-consciousness by the adulation and indulgence of a foolish parent, until his own life becomes a burden to him, unless he is fortunate enough to escape into some school where he will have a chance of being let alone and of forgetting himself in the natural enjoyment of his social nature on an equality with other children. A TEACHER

#### Our Student Traveler in Berlin

THERE is hardly a city of any size in Europe which has not its historical museum, the treasure-house of all its valued relics and records of the past, and civic pride usually houses these collections in buildings that fitly represent the esteem in which they are held. Numerous as these museums are, the collections, even when so small as barely to fill an old council chamber of some historic Rathaus, are usually of interest and worth seeing, for they are sure to contain some fascinating fragments, woven on the great loom of European history, showing that the giant web stretched to the remotest districts. Sometimes one wishes there had not been quite so much history, the sight of some of the relics recalls such awful scenes of woe.

It speaks ill of the goodness of our race that we should be so rich in history of the darkly tragic kind.

Even museums where are treasured relics of another kind are eloquent of tragedy, the tragedy of the soul. Some of the glorious works of art by noblest artists are witnesses of the travail and despair through which the human soul has passed. Even those which in their superb color and beauty of form show the joyous strain of an older and happier order engrafted upon the new, are often tinged with noble sorrow, as if the never-to-be-forgotten memories of an age of spiritual darkness still haunted them.

The city of Berlin, however, with its broad, clean, straight thoroughfares, and its general atmosphere of order and discipline, speaks of

#### Jottings and Doings

(From a Student's Note Book)

WOMEN are gradually demonstrating their ability to perform the most delicate and particular kinds of work in a manner not to be surpassed. Some years ago the experiment was tried by a large factory in the old world of employing women to cut diamonds, a work which requires the utmost skill and patience and which heretofore had always been done by men. So apt did women prove that it is now conceded by the manager that they excel in the art. All day long they sit before the small frames in which the gems are imbedded in wax and carefully wield their little pear-shaped tools. Some idea of the difficulty of the work may be gained from the fact that 400 tiny stones will some-

KAISER FRIEDRICH MUSEUM AND MONUMENT, BERLIN

a release from the old order that prevailed in the medieval towns, when one moved along narrow, tortuous, darkened streets, that ended mayhap in a blind alley. Although the streets of Berlin are lined with memorials and monuments of a warlike past, and there is a martial air upon the throngs that pass through them, they declare that the discipline has won freedom. As the capital city of united Germany, Berlin stands for the fulfilment of a national dream. Reconciliation and peace have come from the recognition by the members of the body politic of the universal principle of Unity.

Richly illuminating are the principles of Theosophy to all who have the will, trust, and courage to make them their own; yet more than ever are they torches along the path to the observant Student-traveler. Undreamt-of treasuries open before the eye and the mind, discrimination grows apace and, almost before one is aware, a new understanding of life and of human history has been born as if by magic.

STUDENT TRAVELER

times weigh less than a carat. A stone of medium size usually requires a full day's work to bring it to perfection. The pay seems pitifully inadequate to Americans, from eight to twenty guilders (\$3.21 to \$8.04) per week.

It is somewhat surprising to note what a vast army of women wage-earners in the United States is employed in the textile mills. And yet this is a quite natural outcome of the past experience of womankind. From time immemorial spinning and weaving have formed an integral part of women's lives; since the fabled days of Minerva and Arachne to those of our own Priscilla and later, these arts have been plied with consummate skill by feminine fingers. When the new world produced machinery to supplant the slower process of hand-production of the old, women were quick to apply their innate dexterity to the new methods. It is estimated that there are 250,000 women operatives in the mills of the East and South, which fully equals the number of men employed in the same way.

# OUR YOUNG FOLK

## The Forests in Europe

IT is always a surprise to the traveler in northern and central Europe to see how many of the splendid old forests are still standing, despite the building of cities, of villages, and of railroads, the cultivation of great tracts of land for food products, and the use of meadow lands for grazing grounds or as bleaching greens.

Love of the forest is an inheritance of the people of Europe from prehistoric times. Originally they were a forest folk, and they ranged free through the thick woven canopy of verdure. They built their simple homes around a spreading green roof-tree. A grove of trees was their temple. Under a tree sat the judge who administered justice. A trunk of a tree hollowed out at first served them for a boat. A wall of stone suggested only a prison. The building of walled cities with dwellings of stone was taught to the forest people by the Romans who built fortified camps all over northern Europe to mark the path of their conquests.

The love of the forest burns almost as brightly in the hearts of the people of northern Europe today as in days of yore. In the midst of nearly all cities there are parks, laid out with beautiful flower beds and trees of all kinds, carefully tended. In the neighborhood of all cities, there is a bit of forest land preserved intact, for the use of the people, who flock to it in great numbers on every possible occasion. In German there is a special name for these woodlands near a city. They are called *Stadtwäldchen*, or "little forest of the city." These little forests are kept free and wild. Only the paths are well ordered. These are carefully swept. One is at liberty to roam at will through these sweet forest spaces. There is only one sign as a reminder to the people not to ill treat their forest friends. It reads, "No Good Man Hurts a Tree." It is the only warning needed.

Of course timber is used in Europe for building and other purposes, and trees must be cut down to furnish it. In order to preserve the forests from destruction there is a law which provides that whenever a tree is cut down another must be planted in its place. In order to have a constant supply of young trees ready, there is maintained throughout the forests a system of tree schools.

A "tree school" consists of an oblong cleared space fenced in and planted with seedling trees. A single school has young pupils of varying ages, just as any good school has. The tree-pupils stand in orderly rows, graded according to size, like young soldiers. Some of them are just out of the warm beds of the

A HILLSIDE ROAD

## THE HEART OF THE TREE

Henry Cuyler Bunner

WHAT does he plant who plants a tree?  
He plants the friend of sun and sky;  
He plants the flag of breezes free;  
The shaft of beauty, towering high;  
He plants a home to heaven anigh  
For song and mother-croon of bird  
In hushed and happy twilight heard—  
The treble of heaven's harmony—  
These things he plants who plants a tree.

What does he plant who plants a tree?  
He plants cool shade and tender rain,  
And seed and bud of days to me,  
And years that fade and flush again;  
He plants the glory of the plain;  
He plants the forest's heritage;  
The harvest of a coming age;  
The joy that unborn eyes shall see—  
These things he plants who plants a tree.

—Selected

nursery and may be only three or four inches high. From this they increase in size, row after row, up to the tall sturdy young trees that are almost ready to take their places out in the forest of grownups.

It is a most inspiring and touching sight to come upon several of these tree schools in the course of a day's walk through the mountains. They speak so eloquently of the warm feeling for the lower kingdoms of nature which should exist in every heart. STUDENT

THE daily life of the Pueblo Indians of New Mexico is filled with interesting and poetic customs. When a child is born it never sees the outside world until it is a certain number of days old; then it is carried out at dawn to look upon the sun. As the first rays of sunlight fall upon the little one prayers are quickly said and the baby's names are pronounced. Then the ceremony is over.

## Red Jacket, "The Vigilant"

RED JACKET was not so called among his own people. After the manner of many uncivilized tribes he was given a trial-name at first. "Always Ready" he was called for many years, until he had become a leader to his tribesmen. Then they gave him the name of "The Keeper Awake" or "The Vigilant." The fragments of this wise Indian's eloquence that have been written down reveal the fact that the name was well bestowed. He *did* keep his people awake, and though his efforts for them were tardy, they were of great help both to the Indians and to the white neighbors, who came to understand better the hearts and lives of Red Jacket's people.

The following is related of Sa-go-ye-wa-tha (Red Jacket): A dispute having arisen concerning the terms of a treaty

between this chief and the white people, an agent was sent to settle the matter.

"You have forgotten," said the agent, "we have it written down on paper."

"The paper then tells a lie," rejoined Red Jacket. "I have it written down here," he added, placing his hand with great dignity upon his brow. "This book the Great Spirit has given the Indian; it does not lie!" A.

## Facts Worth Knowing

COBALT is a white metal harder and brighter than nickel. It is used extensively in making plating material and also for electric storage batteries. Not long ago a nugget weighing 800 pounds was taken from a cobalt mine in Ontario, Canada.

THE number of languages known to be spoken in the world is 860; 89 in Europe; 114 in Africa; 123 in Asia; 417 in America; and the other 117 in the islands of the South Seas. The number of dialects is said to be 5000.

IN 1837 a single mesquite seed was planted in Honolulu, the capital of the Hawaiian Islands. Now there are 50,000 acres of this plant, but of a slightly different character from the parent mesquite.

PARAFFIN is a fatty substance produced in the oil refineries during the preparation of crude petroleum for the market. At first it was considered useless but now it is made into candles and, when refined, is used to whiten and polish the clothes in laundries, to seal jars of fruit, to make colored crayons, and to spread over stone to prevent the surface from crumbling. It was an application of paraffin that preserved Cleopatra's Needle in Central Park, N. Y. when the surface began to wear off.

# THE CHILDREN'S HOUR

## A Legend of Brittany

ONCE there lived a rich man who had three sons and one daughter, Lisbeth, who was a widow. When he died the sons cheated Lisbeth out of her share of their father's wealth. The eldest took the house, the farm, and all the cows; the second took the mill and all the horses; and the third took the bakery and all the sheep and oxen. Lisbeth was forced to take her little girl, named Weissdörnchen, to a miserable old hut on a lonely moor outside the village.

There they lived in great poverty. All they had was one little black cow given them by the youngest brother, who did not wish to see them starve. Weissdörnchen, whose name means "little white thorn," tended the black cow, and grew to love her.

One day while she was watching the cow on the moor, and tying up nosegays of wild flowers, she noticed a little bird hopping about and chirping away just as if he wanted to make her listen. She got so interested in watching him that she forgot the time, and her mother came out to see what had become of her. When they looked for the cow she was nowhere to be seen, and after a long hunt for her they found that she had been attacked by a wolf and torn to pieces.

Poor Weissdörnchen spent the night in weeping over the cow's fate. In the morning, very early she ran out, and the first thing she saw was the very little bird she had noticed the day before, chirping away as he had been when Weissdörnchen forgot everything else to watch him. He flew close to her and she felt sure that he wished her to listen to him for some reason. Suddenly she saw something yellow on the ground and thought it was gold. She turned it over with her foot—it was only a blossom of the yellow groundsel, but she had no sooner touched it with her bare foot than she understood what the bird was saying.

"Weissdörnchen," he said, "I am your friend. I will help you."

"Who are you?" asked she.

"Redbreast," said the bird, "and I have it in my power to make one poor, good little child happy every year, and this time it is to be you."

"Oh, can you help me?" said the little girl; "we are so poor, and now the cow is dead and I do not know what we shall do."

"Follow me," said Redbreast, and away he hopped with Weissdörnchen following, over the moor and across the stony fields until they came to the sea, where they could see the Seven Islands.

"Do you see anything on the sand?" asked Redbreast.

"Yes, I see a pair of wooden shoes and a little staff."

"Put on the shoes, and take the staff."

"I have them on, and here in my hand is

FLY away, fly away over the sea,  
Sun-loving swallow, for summer is done;  
Come again, come again, come back to me  
Bringing the summer and bringing the sun.

the staff. What shall I do next, Redbreast?"

"Now walk over the sea just as if it were the moor, to the first island. You will see a great rock. Pick some rushes that grow near by and make a rope; then knock on the rock with your staff. Whatever comes out make fast with your rope."

Weissdörnchen did as the bird told her, and everything happened just as he said. When she tapped on the rock, out stepped a white cow, very sleek and pretty and so gentle-looking. Weissdörnchen did not need to be told what to do with her; she led her home. The bird had disappeared after keeping his promise to help the little girl.

Such a beautiful cow as this was! She gave so much milk that all the pails and pans they had would not hold it and they sold it to the neighbors, who all said they had never before known a cow to give so much milk. The news spread and Lisbeth's eldest brother came and wanted to buy the cow.

Lisbeth said she would let him have the white cow if he would give her in return the part of the farm and the number of cows her father had meant to give her. The brother was so anxious to have the cow that he consented. Weissdörnchen was so fond of the white cow that she could hardly bear to see her go. In the evening, however, when she went to the stall, still feeling lonely for her charge, there was the white cow.

"Here I am," said she. "I could not stay where they took me. I can live only with good people."

"But my uncle will come and take you back," cried the little girl.

"We shall see. Go and get three milk-wort blossoms, and while I am eating them call out 'Redbreast' three times."

Weissdörnchen did this. In the twinkling of an eye the cow was changed into a beautiful horse who was as wonderful in his way as the cow had been, for he could go faster and carry more than any horse that had ever been heard of.

The news spread and one day Lisbeth's second brother came to her and offered to buy the horse. Lisbeth told him she would give the horse in return for the horses and the share in the mill that he had cheated her out of at the time of her father's death. The brother was willing and led away the animal.

But in the evening Weissdörnchen found him in the stall. He told her to bring him three milk-wort blossoms and call "Redbreast" three times, as he ate them. The result was that the horse changed into a beautiful sheep—a magic sheep, for the wool grew as fast as it was shorn from its back.

The third brother heard of this sheep and came to buy it. Lisbeth let him have the sheep in return for the sheep and the share in the bakery that her father meant her to have when he died; but as the man was leading the sheep home, he passed the place on the seashore where Weissdörnchen had found the shoes and the staff. Quick as a flash, before the man could stop it, the sheep jumped into the water, swam out to the first of the Seven Islands and disappeared. It never came back, though Weissdörnchen went to the stall and watched for it; but Redbreast hopped up to her and said: "Good-bye, little girl, your mother and you will always have plenty of food now and a nice home. Remember the poor."

And so it was; for Lisbeth's brothers kept their promise and gave her all that they had promised her for the cow, the horse, and the sheep, which was what her father had meant her and Weissdörnchen to have. As for Weissdörnchen, she never forgot Redbreast or the advice he gave her.

## Scientific Methods and Final Problems

THE rapid progress of science towards a true comprehension of the laws of the universe is a frequent subject of slightly ostentatious congratulation on the part of some of our popular writers. Let us pause a moment and consider how far this is warranted, and if the humble and reverent attitude of such minds as that of Sir Isaac Newton—who seemed to himself like a child playing with shells on the shore of the illimitable ocean of truth—is not that through which the real understanding of the subtle and controlling laws lying behind material phenomena may find entry.

It is desirable occasionally to reconsider this question, because there is a tendency for inquirers into Theosophy to imagine that the mechanical methods of modern science not only lead to the discovery of new phenomena of force and matter, but that they are capable of unsealing the *penetralia* of nature's profounder mysteries, of opening up the realm of causes. Theosophical study shows that the latter is not possible until the system of investigation is placed upon a different basis, until nature's laws and processes are regarded from a more spiritual and less material standpoint, and

Modern Science is Self-Limited

until the time-honored methods of the Archaic schools are adopted. The forces of evolution now in activity, and the efforts of the most altruistic and advanced souls of the day, are pushing a certain portion of the thinkers of the race towards that condition when a much nearer approach to the desired knowledge of causes will be possible to them, and the rest will follow in good time. The change will be fundamental; it will be a breaking away from the conception of the universe as a mechanism reducible to terms of unconscious matter and force, to the knowledge that it is a palpitating Organism, alive and conscious in some degree in all its manifestations, even in the mineral, and "lower." There are already signs of advance towards wider and more Theosophical and reverent views on the part of some eminent thinkers. The recent observations of Professor Darwin at the British Association meeting respecting memory and intelligence in plants illustrate a position farther advanced than the average. Naturally he has been criticised by the more materialistic-minded, and by the religious bigots.

Nature is Embodied Consciousness

Science has deliberately restricted its researches to the outer forms which can be investigated by mechanical instruments, and to deductions therefrom based upon the evidence

of the physical senses. The sequences of events observed are called the *laws of nature*. Yet in strict truth we know no reason why these sequences should not change or adopt another course; why, for instance, oxygen and hydrogen should always unite to form water, a substance possessing properties which would never be suspected from an examination of its constituents taken separately. In proportion to the increase of careful observers and the invention of improved mechanical instruments more sequences of events are found in nature—new laws as we call them—and there are even a few instances where a logical thinker has ventured to look a few steps ahead and prophesy some new discovery. In such a case he has only based his impression upon a reasoned extension of ascertained sequences, not upon an inner, firsthand and self-identifying knowledge of the nature of the intelligent or semi-intelligent forces which energize through matter. To the eye of the far-distant scientist, who will be possessed of the attributes of spiritual seership, the modes of manifestation will be apparent before the first atom is thrilled into activity.

An Orderly Evolution of Reality

The day will arrive, we firmly believe, when our present methods of catechizing nature will be regarded as actually primitive.

A good example of the scientific attitude of the moment is afforded by chemistry, one of the most fruitful and elevating of the sciences, and a standing proof of the high intellectual attainments, mechanical skill, and daring imagination of its workers. The formulae of the elements and their groupings have been devised and wrought out with marvelous ingenuity and they provide an admirable working hypothesis; yet no one knows how the atoms and molecules are really arranged, or whether they

The Unknown Bridge from Mind to Matter

even retain their separate identity at all when in combination. It is most likely that they combine in some manner quite beyond the reach of our present insight. And, in fact, we do know that the so-called elements themselves are not neatly separated, isolated substances, as it was once thought, but they show a certain want of uniformity within themselves and a tendency to form a continuous progression through a septenary scale. The combinations are only conditions through which entirely unknown forces come into physical play; chemical affinity is a form of life, and these living forces will be the subjects of investigation in the future.

Turning to astronomy we find a similar state of things. Nothing is known to physi-

cists of the intelligent forces supporting the ideal framework of the universe. Our knowledge is rudimentary and external; and although astonishing mathematical skill has been devoted to working out problems from the imperfect data given, even in such a primary matter as the real paths of the planets we are quite ignorant, for all our calculations assume elliptical orbits round a fixed sun, for practical purposes; while in reality the orbits must be extremely complicated curves described under the control of a moving sun, whose direction and speed are not definitely known.

To modern science the universe is supposed to be quite independent of and indifferent to man's existence. We are told that before man was evolved from the slime the familiar natural forces behaved as they do today, and that when the race has become extinct indifferent nature will pursue her way regardless of the petty human episode. We are irresistibly reminded of the way the victim in *The Mikado* is consoled by being told about the fireworks in the evening, "You won't be there of course, but they will take place all the same!"

Turning to the Theosophical position a very different picture is unveiled. **To Theosophy** Man and the universe are no longer disjoined. **All is Order** The problem of the universe becomes one of consciousness, a primary one, and we find that to understand the "Macrocosm," the Kosmos, we have also to study the nature and working of self-consciousness in the "Microcosm," individual man — the mirror of universal law.

Every man is a representative of the greater World-Being. As in his embryological development he epitomizes, in a few months, the racial history through which he has passed in previous lives, so he will in time unfold every quality and power that can be found in Nature, though as yet they are indeed mostly dormant.

The Universe was evolved by Intelligent Builders, Divine Creative Powers, called the "Elohim" in *Genesis*, and they are reflected, and also partially live, move, and have their being, in men. The progressive goal of human evolution is the becoming consciously aware of and one with these divine forces. And it is not *dead* matter that the Creative Forces are arousing to activity; such a thing would be an impossible anomaly in a living Universe. **A Living Universe Cannot be Dead** The *Anima Mundi* or Universal Soul was not invented by Anaxagoras, nor even first discovered by him. Ages before B. C. 500, Aryan philosophers had arrived at the necessary conclusion that everything has its form of consciousness. This is not modern "Animism." H. P. Blavatsky says:

The idea of Universal Life is one of those ancient conceptions which are returning to the human mind in this century, as a consequence of its liberation from Anthropomorphic Theology.

Man is indeed made in the image of the Ever-Living, but this does not mean the anthropomorphic God of old-fashioned theology. It is a brief statement of the fact that man is an aggregate, or focus, of all the elements in Nature, physical, mental, and spiritual.

Before the Real can be approached by those who are hungering for knowledge, they must

be hungering and thirsting for something higher than the mere satisfaction of curiosity, however sublimated. The divorce between "Religion" and Science has been deplorable, though inevitable and hardly

**Only False Religion and Science can be Inconsistent** surprising, for Religion so-called, had descended to superstition and persecuting bigotry. Before a man can

approach the Tree of Life and Wisdom, a profoundly impersonal and unselfish desire for the welfare of humanity — not only in the material sense but in the higher spiritual sense — must inspire him, to the exclusion of "even the shadow of desire." This once attained through the growth of the god-like spirit of Compassion for all that lives, and through self-discipline, he becomes more than man, and, truly, "all knowledge is his province."

We cannot expect much comprehension of spiritual laws in such an alien environment as we have today, an age when every new invention is regarded as a new opportunity of pandering to greed or ostentation, and which too often increases the maddening haste of living, the ever-growing devil's-dance which fills our asylums with nervous wrecks and our cemeteries with suicides.

The understanding of the deeper laws of nature will be forthcoming when the condition of the world permits their safe demonstration. Until then, **Unselfish Devotion the Only Condition** only the few who are strong enough to lay aside their personal limitations and to devote all their energies towards the uplifting of the race, regardless of worldly praise or blame, can expect to lift the Veil of Isis; and until then they will have to guard their knowledge from profanation as they have done hitherto, not out of selfish desire of possession, but from the certainty that irreparable injury would be done by the premature disclosure of even the little that this age could comprehend. C. J. R.

### "Blind Forces" Ruling the Universe

THE theory, held by Kelvin among others, that the sun's heat is due to the compression of its mass by gravitation, places the mysterious agency that causes gravitation in a very high place. When we think of the number of things we owe to the sun's heat, and then say that all this is due to gravitation, then gravitation becomes the highest power in the universe!

This positive mania for reducing everything to a formula whose terms are "gravitation," "affinity," "inertia," and the like, does not result in simplicity; it merely makes these things substitutes for the eternal Formative spiritual Causes. The imaginative mind is left in contemplation of a universe full of nothing but blind forces, set in motion goodness know when or how, and utterly devoid of any conceivable purpose or use. And the imaginative mind staggers and rebels against the attempt to conceive such a thing. But some scientific theorists do not seem to have the higher senses very wide awake. They are not much troubled by such doubts.

It is little wonder that men confronted with such theories should have to invent a God to do all the real business of the universe; and that as science will not allow him a place in

the universe, they should have to place him *outside* of it.

Ever since experimenters showed that there was a quantitative relation between mechanical energy and the heat developed by resistance thereto, it has been *assumed* that heat is nothing more than a form of mechanical energy. But heat is something that exists apart from its physical manifestations, and the mechanical energy is but a means of exciting it and causing its physical manifestations. In the same way, light and electricity are energies that are prior to matter and which manifest themselves through matter when the proper conditions are produced. Science produces these conditions, but the conditions are not the cause of the heat, light, or electricity — they are only the cause of their physical manifestation.

Heat is a *source* of energy; that, science admits, and in making energy a source of heat it gets an endless circle. According to the dynamical theory, the energy in the universe will gradually "run down," assume a static form, and then what will happen? The fact is that all the time energy is running down — and being wound up again, but science knows not the forces that wind it up. The "anabolic" processes in living organisms, which defy the chemical processes, are energized by forces that are not physical, the forces of invisible Life guided by Mind and Will.

The mechanical theory of the universe is sometimes supplemented, in the minds of the pious, by the postulate that at some remote epoch a Divine Power started the whole thing going by one impress of his divine will, and then left it to run. But this Divine Power is present all the time and in every place, being the source of all energy. The theories as to gravitation, heat, etc. in the sun, may be reasonable in varying degrees from a mathematical point of view; but we should not stray off so far into mathematical formulae as to forget that we are thinking in symbols and formulae, and to lose sight of the realities they stand for. STUDENT

### Regulating the Volcanoes

HENCEFORTH we are not going to let the volcanoes spoil things just as they wish. Professor Lichtenberg has taken the first step, presenting King Victor Emmanuel with a project for draining Vesuvius by a system of subterranean canals. The lava will thus be led off into the sea or wherever it will do no harm. The pressure will not be allowed to accumulate and so there will be no explosion. Moreover a few well-drained volcanoes might so relieve the total internal pressure that no fresh ones would form.

One is somehow reminded of the proposal to use horse power for boats. The legs of the horses were to stick through the bottom of the boat and be attached to stilts of adequate length.

How would the workmen dig the last stretches of the tunnels, the heat ever rising? And what would become of them when they had opened the tunnels into the boiling heart of the volcano? The mice decided that the simplest way to deal with the cat was to hang a bell round her neck. There was, we learn, some hitch in the maneuver.

How much of the Andes range should be tapped, to keep Mont Pelée quiet? STUDENT

# Some Views on XXth Century Problems

## A Thread in History

ONE of the essays in John Morley's—it is impossible to write *Lord Morley's*—recently issued volume devotes itself, among other things, to a discussion of Professor Bury's view that "history is not a branch of literature" but a science. The historian may not transcend the province of facts. He may not even frame a theory to cover his facts, still less begin with one and select facts accordingly.

Morley gently punctures the contention:

Perhaps some of Professor Bury's more youthful listeners, with the presumption of their years, may have asked themselves whether the historian is to present all the facts of his period on his subject; if not, whether he will not be forced to select,—

for which he will surely require "some guiding principle, conception, or preconception."

But is science a brute mass of facts, unthreaded, undigested? The man of science, considering some facts, suspects an explanatory law. He then considers all the facts he knows to see whether his hypothesized law is a reality. Finding it to be so, and writing a book or paper, he groups the whole body of relevant facts around his law.

Have the historians, in considering the rises and falls of nations, arrived at no suspicion of a law? For the rises, hardly any; since several quite unmixed nations may occupy the same geographical location. For the falls, internal disunion, and luxury.

If at some stage in animal evolution when as yet there were no complex many-celled organisms whose cells had to some extent forgone their individuality to make a whole, but when the nearest approach to this were groups of essentially separate cells almost accidentally cohering; if then, one of these cells had had intelligence enough to write a history of what he saw around him, he would not have data enough for the establishment of a law. He would see here and there the temporary cohesion of a mass of cells, the endurance of the cohesion for what seemed to him an immense length of time, and then the dissolution of the union into individuals. He might note that one mass which had achieved some sort of organization, was able to make successful war upon one whose cells were incoherently stuck together, each fighting for itself its own life fight and unconcerned about the rest.

But the profound law that nature was trying to make coherent organisms in which each group of cells had separate duties in the doing of which they served the whole—this would be out of his purview. Still more so, that when the organization had become very perfect a (human) soul would be able to incarnate in it and a new level of evolution open up.

The historians seem to be as blind as that cell. But they ought not to be; for all nature is showing them the law. As they look back they can see groups of individuals cohering, arriving at some sort of imperfect organization, and then losing what they had gained. In their growth into nationality the

growing organization is shown in the *national* consciousness of the units. They think first of the nation, afterwards of themselves. They are ready to die for it. In their decay they have split into groups, into classes, each trying to get from the state whatever it can, to give as little as it can. This is the spirit of the units also. When this disunion has reached a certain point the state, or nation, either disappears or is overwhelmed, finally or with possibility of recovery.

This is the principle of history, the backbone. Preliminarily to making an organism of humanity, nature is trying to make subsidiary organisms of the nations, to be the organs of the final one. There are one or two other threads amid the complex of fact, but this is the most obvious.

STUDENT

## Cemetery Reform

"SAGES grieve neither for the living nor the dead," says the *Bhagavad Gītā*, implying an injunction which to many seems hard-hearted enough.

What might they not have done, we say, if Keats had lived beyond his little span of twenty-four years; Shelley beyond his thirty; if Hamilton had not fallen before Burr's pistol; if Mozart and Byron had been granted a longer stretch? Should we regret what may seem to us the prematurity of death, the cutting short of great careers, the extinction of great powers of mind—if we could see deeper? Atropos with her scissors does not look so grim to those who have learned of Reincarnation; in fact her face becomes one of the faces of universal wisdom. She cuts but a little way into the eternal thread. The soul does not come to earth proposing to achieve all its career in one short life. It has its days of work and nights of rest, and each day, which to us is a life, has some clear task, some definite step of growth or learning. When a nation has to be carried across a great crisis, a soul whose power corresponds to the need may take that for its task, discharge its self-imposed duty with every burning energy of mind and body, and then go. It is itself then Atropos, though we see but the enemy's bullet, the accident, the disease. Indeed, till the very moment of death—*after* death, as we regard it—the personality which it informed with the intelligence and the urge to the work, may not understand what it has done.

So with the musician, the poet. In some few years of creative work they may have exhausted the limit of possibility for that brain. To go farther they must take another. They may have spent themselves striking some new keynote that will make art move forward another step. They may need the experience of the last disappointed hours of illness, when, as it seems to them, they have achieved but little of their possibilities. As perhaps with Poe, the art work may be altogether subsidiary to some other purpose in the incarnation, the burning out of some crippling growth in character, or the performance of some piece of work the world does not see at all or thinks

to be nothing in comparison with the other.

But the soul knows all and accepts all, knows all with perfect clearness ere its birth and after its death: and knows in a profounder way, beneath its consciousness of itself as personality, even during life.

Even the evil that men do, though it must work out in full proportioned punishment for themselves, is pressed into the *service* of the souls of those to whom they do it.

For the very being of the universe is evolution, and every soul in its own consciousness knows that, however darkened may be the knowledge when pressed into the very midst of sensuous matter. Some time, all men will hold their own in its fullness there as elsewhere.

Is it not time we stopped putting truncated cones into our cemeteries?

## Negation by Commas

THE Devil sometimes makes very effective use of quotation commas, undermining the moral import of a statement as effectively as a shrug of the shoulders may undermine the repute of a man.

There are, for instance, two groups of Pragmatists, differing by the use of quotation commas. President David Starr Jordan says:

Whatever will work in the conduct of life, strengthening it, enriching it, giving it a higher trend, must, so far as it goes, have elements of truth.

He guards himself; he says "so far as it goes," and "elements of truth."

But he does not put *truth* in quotation marks; he does not imply that there is no such thing; it is perfectly respectable Pragmatism.

There is a Devil-made imitation of this which *does* put *truth* and *true* in commas. The phrase would read:

Whatever beliefs help or encourage you to live the kind of life you want to live, you are at liberty to call "true," if you happen to like that word. By all means go on believing in immortality and the soul if you find those beliefs comfortable.

That French cynic was a Pragmatist who said he liked the women to have a religion because they kept the house better. Pragmatism is the phosphorescence of decaying belief.

But in the decay is the seedling of knowledge. Some are already saying:

Even if we cannot know what is the spiritual essence of duty, nor of compassion, nor whether there are spiritual essences at all—we can at least stand up to duty, at least work constantly according to compassion, uplifting humanity as best we know how.

It is a spiritual essence that is speaking: and if it will hold itself in its own nature by means of the work it has prescribed for itself, it will presently know itself and its immortality and the supreme spiritual essence of the world. It will know *truth*, not "truth." And of this truth the mind will then immediately demand a systematization. But it will be wiser to curb than force or even encourage that. The lumber rooms of history are full of these elaborated products.

RECUMBENT FIGURE OF THE BUDDHA IN THE "LION POSTURE."  
HEWN FROM A SINGLE ROCK. GAL VIHARA, POLONNARUWA, CEYLON

## Recumbent Figure of the Buddha, Polonnaruwa

**T**HIS statue, which has suffered little from the ravages of time, is 46 feet in length, and is still part of the rock from which it was carved. The head rests upon the right hand which sinks naturally into its carven pillow, suggesting, with the natural folds of the robe, the most perfect repose. It is technically called the "Lion Posture." In the stillness of the jungle this statue forms an apt symbol of the ideal of Nirvāna. STUDENT

## Memphis, the Mecca of Races

**T**HE discoveries made by Flinders Petrie and his students at Memphis during the past year include a large number of terra cotta heads, which indicate the great confluence of races at this center at an early period. Certainly Egypt cannot have been so exclusive as it is often alleged. Some are of Nubians, others Egyptians, others Greeks. Again there are others of Mongolian type, others representing immigrants from Asia

Minor, or of Cypriote races. One is probably of Tibetan character, and the posture, cushions, and garments are familiar in Indian sculpture, pointing to the existence of an Indian colony in Egypt. A Persian cavalry officer may be identified by the regimental badge mentioned by Herodotus; he is swathed like the cavalry on the Alexander sarcophagus. A Syrian head shows the same type as the figures of the Aamu on the paintings of Beni Hassan. All this shows the universal respect which the learning of Egypt commanded. E.

## The Greeks Defended

**S**OME professors have recently been inveighing against commonly received notions about the ancient Greeks. These notions have been described as

A conception of Hellenism as representing some easy-going half-animal form of life, untroubled by conscience or ideals or duties, and the Greeks as a gay unconscious, hedonistic race, possessing the somewhat superficial merits of extreme good looks and a mythically fine climate.

It is really childish to suppose that a race which started us in nearly every line of our culture, could have had such a character.

This notion was engendered by the Christian apologists.

It seems to be one of those perverted notions which often appear in history to obscure our vision of the truth. . . . One of the things which is putting an end to it, or which has already done so, is the more vivid conception of ancient Greece that archaeology has brought.

The above notions are still to be found in our school-books, many of which throw a slur over all the civilizations preceding our own, and give the impression that mankind has always oscillated between childish folly and cruelty, with occasional quite laudable efforts at enlightenment.

Such a view is of course illogical as well as mean, and the real stigma attaches to those who maintain it, as it reflects equally upon their qualities of heart and head. STUDENT

# The Trend of Twentieth Century Science

## The Scope of Instinct

A GERMAN biologist, Doflein, observed in the island of Martinique three species of lizard, one brown, one green, and one spotted gray. He further noted that when he approached they vanished as if nowhere, into nothing. But he cleared up the mystery. The brown ones had scuttled under bunches of dry brown grass; the green ones had hidden in fresh green grass; and the spotted ones under such shrubs or other material as corresponded with their color peculiarity.

He collated this and some similar facts with others of another kind. There are, for example, certain sea-spiders which clothe themselves permanently with material calculated to conceal them, to assimilate them with their surroundings. The process "resembles that described above in the case of the lizards," says *La Revue Scientifique*. "In the one case the animal modifies itself to correspond with its environment; in the other it moves into the environment that corresponds with its appearance."

For both cases, and indeed for cases of protective mimicry in general, the Doctor regards the theory of natural selection as useless. Color schemes, he thinks, are never developed for purposes of protective mimicry, but are the mere outcrop of deeper physiological changes. Moreover, what seem exact color mimics to us may be not even remote resemblances in the eye of the creatures' enemies. But once that the protective color has arisen — "without any relation to adaptation" — it is used with conscious instinctive purpose.

The forms, colors and design do not arise through selection; but when they *have* arisen they combine with the instincts of the creature and thus become protective. The animal thus manages the selection for itself . . . thanks to its psychic faculties.

In other words, the animal either knows what it resembles and goes to that for hiding; or, as with the sea-spider, knows what it would do well to resemble and covers itself with the necessary material.

Dr. Doflein is certainly deepening the meaning of the word instinct, deepening it, in fact, to include the intelligence which is behind the animal. STUDENT

## The Singing Convolution

NOT often does one see a scientific note on the brain taking care not to be materialistic in its implication. But *La Revue Scientifique* exhibits the phenomenon. It is talking of the brain of the German musician and singer Stockhausen. This was examined after his death in order to determine whether there was any relation between the power of singing and any of the convolutions.

The part of the skull constituting the left temple covers three convolutions or rolls of brain matter, running forwards one above another. The lowest, the third, of these is concerned with speech. Speaking of the three and of the frontal lobe as a whole the paper says: "The remarkable development of the frontal lobe of this artist . . . is perhaps the material substratum of his great intelligence

and powerful energy." We may be grateful for "material substratum."

In this singer the three convolutions were very marked, but especially the second. Another singer, whose death occurred some years ago, suddenly stopped one day in the course of a song and was unable to produce a note. A cyst of the second left frontal convolution was subsequently found. And the brain of the musician Koenig showed a development like that of Stockhausen.

So it seems that the second left frontal convolution stands to song as the third to speech. They are the connecting points between ideation and the complicated motor apparatus. It is worth noting that the discovery has been made without vivisection. STUDENT

## Plant Sight

THE lens cells of the leaves of plants, to which we have already referred, were made the subject of a paper by Professor Wager at the recent British Association meeting. Their focal length is of course exceedingly small, less than the thickness of the leaf, or they would be useless. For their purpose is to focus light upon the deeper layers. But they are extremely good lenses, and this the Professor proved by producing a number of photographs which he had taken by their means. He enlarged upon the screen their pictures of Huxley, Darwin, his own niece, and some landscapes, houses and trees.

Plants appear to be capable of evolving these lenses at need, from the indifferent epithelial cells covering their leaves; for the more they are kept in shade the greater the number of the lenses. In addition to focusing light upon the chlorophyll in the deeper layers of the leaf and thus stimulating it, they also keep the leaf informed as to its position with relation to the sun. They must find a lot of "scenery" in the white light to which we are blind. For of two pencils of it, one containing a little more blue than the other, or an infinitesimal fraction stronger than the other — differences absolutely imperceptible to us — they will confidently select the bluer or stronger. They see, in fact, exactly what they need to see. STUDENT

## The Great Ripples

WHY are great ranges of mountains so frequently along the coast line? Professor See, in the *Pacific Magazine*, returns to, and develops, his answer to this:

Just south of the Aleutian Islands there is a deep trench in the sea, which has a depth of from 18,000 to over 24,000 feet. This depression is long and narrow, just like a trough, as if dug out by supreme intelligence; and right next to it on the north, the Aleutian Islands run parallel to this depression all along. The Aleutian Islands are in fact a mighty mountain range under water, with only a few peaks here and there projecting above the water as islands. This great ridge is not only parallel to the deep trench just south of it, but of almost exactly the same volume; so that if one had a shovel large enough to take off the great island ridge and throw it in the trench, it would about fill it up.

This illustrates the theory. A depression in the crust involves an equivalent elevation alongside of it. The depressing force then ex-

tending to this elevation and depressing it also, another elevation forms farther out. Thus a ripple with an elevated edge runs outward from the primary center of depression. If that center was the deepest part of the bottom of an ocean, the ripple of elevation will finally run up the coast and begin a mountain chain along there.

The theory assumes that in the depth of the crust the rocks are fluid with heat, are lava. At the bottoms of oceans the great weight of water forces a percolation through into this fluid rock, and the percolating water expands at once into gas. To do so it has to force some of the laval fluid sideways, lifting the solid overlayer of the crust into an outgoing ripple. The roof of the gaseous chamber ultimately falls in and the superincumbent ocean fills the depression. Water temporarily withdraws from the nearest shore. But the deep currents rushing for the pit heap up the surface water above. This heap distributes itself, the distribution constituting the great wave which in about an hour will follow the withdrawal from the unhappy shore.

This process occurs again and again; the ripple of subcrustal lava which reaches the shore rises higher and higher on each occasion and at last constitutes a mountain range. The great bases of mountains are thus composed of lava which, being porous and relatively light, accounts for the fact that the pull of mountains on swinging pendulums is not as much as the bulk would suggest.

The theory must, however, set a limit to the process it describes. For if one follows it to its consequences it becomes obvious that the growing weight of the upheaved mountains must sometime balance the force trying to drive more lava underneath them, that is, balance the weight of the water. A secondary range would then result, parallel to the first but some way out at sea. The finale would be a series of circular ranges with their common center at the deepest part of the ocean floor, but by this time very deep indeed. The theory should therefore explain why soundings do not show any such picture. Moreover it seems to require that the majority of great earthquakes shall radiate from the deepest bottoms of the sea, where the roof of the gaseous hollow falls in. And the seismographs do not show this to be the case. STUDENT

## The March of Universes

THREE other astronomers, Professor Dyson, Professor Kobold of Kiel, and Mr. Eddington, after specially directed research, have exactly corroborated Professor Kapteyn's imposing discovery that the stars are in two vast hosts, moving towards two opposite points in the sky. It has even been suggested there are two universes passing each other in space. Professor Dyson took for examination 1100 stars, distributed through both hemispheres, having a proper motion of between 20 and 80 seconds of arc per century. He finds them in transit towards the apex or objective point previously indicated by Kapteyn and confirmed by Eddington. STUDENT

## Nature

## Studies

## Plant Intelligence

SOME fluttering appears to have taken place in the scientific dovecot upon the announcement that an eminent scientist is prepared to maintain that plants have intelligence. This is nothing new nor is it particularly startling; most ragged barelegged boys who hunt for birds' nests and run about after butterflies have known it for years. It is true that the tremendous scientific difference of consciousness is added and the postulate or theory made to read "conscious intelligence"; but what in reality does that mean when reduced to plain schoolboy language? Simply that plants do things because they want to!

Anything has been acceptable rather than the concession that a plant is more than the visible stalk and root and leaf and fiber and cell. So it takes a big scientific reputation and a name, and courage not always found in science, to declare that such a dreadful thing is possible. And the world holds its breath to see what shall be the effect of this startling bomb in the camp of orthodoxy.

A ten minutes' walk will tell us all we need to know on the point. Here is a growth of smilax—a tender shoot 26 inches high with scarcely a leaf yet unfolded. It has reached out to wind its tender vine around a tent rope twenty inches away, deliberately passing an apparently stiff shoot of its own kind en route, except as a mere temporary prop. The latter will reach out for the same rope when it is tall enough.

Among the chaparral a few yards away are the little people of the hills, who are here because they have won their footing after long and fierce struggles. They have had to use an immense store of intelligence even to live. At the side of this cañon is a *yerba santa* bush—just an ordinary bush. Its stems are perhaps an inch or so in diameter and its height is about a yard. Growing in the hard uninviting soil of the hill, it is placed in the same position as many another bush of the same sort. But far below in the cañon, twelve, twenty, twenty-five feet away, is a residue of moisture and shade. Our *yerba santa* knows that. So he sends out a root to go and fetch it. The knowledge may be hereditary, it may not, but he knows several other things. One is that the hot dry sun is going to beat down on that bare root and dry it all up after the rain has washed away every vestige of covering earth. Boring deep into the earth, then, is useless, and also tedious. A surface pipe is in danger of drying or breaking. So Mr. Yerba Santa does just what the deep sea cable companies do, as he did hundreds of years before they were heard of; he sends his line out encased in a thick heavy cable-covering of wood and bark. It looks so dead and useless that nothing is tempted to touch it; and so the little bush draws its water from the bottom of the cañon

by its own system of pumping and irrigation. Mr. Yerba Santa certainly has a good deal of sense; to call it unconscious is about as useful as the old fetish of the fortuitous concurrence of atoms.

Here is an old dead bush—sage it looks like. Could not survive the long summer drought. At least that is what we said last week when we came this way. But there has been an inch of rain since then. What a change! Our sage bush is a mass of tender

Lomaland Photo. and Engraving Dept.

IN AN ENGLISH WOOD  
A LANE AT BIDSTON, CHESHIRE

green shoots. The wood that seemed so dead was acting as a protecting sheath for the core against the heat, and the shoots of last year which after doing their productive work of seed-bearing did not drop off, now, *even when dead*, do the work of shading the new shoots while they grow as quickly as they can to their full power, for in the short season every possible advantage must be used. And the dead leaves? They also have a work to do. Gathered under the bush they shelter the roots and preserve the moisture in the ground as long as possible. And the roots? They know their season is short and they waste no time in questions of instinct, unconscious cerebration and conscious intelligence. Someone cuts one.

It has no time to spare, and life is valuable in the chaparral. So it sends out leaves and shoots everywhere where it contacts the air. A dry old root of last summer, cut away, is now a mass of tender green. If time does not admit of stalks being grown, the leaves are sent direct from the wood. Somehow the season's work of producing, producing, must be accomplished.

Then the seeds. They know. One year there is plenty of rain, very early and well distributed in point of time. A mass of blossoms covers the hillside and all proceeds in due order. But next year the rain is irregular and scanty. An entirely different set of seeds seem to take precedence and flowers scarce last year are common this. All these things are not above the understanding of very little children, but on the contrary, are exactly what they can appreciate, for they are natural and reasonable and are legitimate fairy tales.

The writer has known a very little boy who invented a system of treating all these folk of the wildwood as intimate friends—when no grown-ups or scientists were visible. In a tangled mass of growth he would hold long conversations with Mr. Tree and Mr. Snake; Mr. Poppy and Mr. Sallal. He had no doubt of their consciousness, but possibly misjudged their degree of education in the English language—possibly.

Anyone who is interested in the subject can see instances if observant. The eucalyptus and the acacia that send a root thirty or forty feet to steal the water from a pet flower in a garden that is watered daily; the blue gum that gathers the mist round its vertically hung leaves and condenses the water to fall on the earth below; the bushes that grow in a broad thick slope with no ends for the wind to cut off; the wall creeper that avoids the windy side and draws a sharp line between the sun and the shade, avoiding the undesirable side; the plants that lay up great store of water against the dry season or the production of immense seed-flowers; the little flower that has no soil and a mere drop of water, producing no leaf or stalk to speak of, but merely a seed pod, and that as quickly as possible; all, all tell of a conscious intelligence behind the life of the plant, which life is not more than is the physical body to the human being.

For further information on the subject go to the children. They do not have to learn such things as these—unless we have made them forget. M.

## Salt Production in the United States

THE United States leads the world in the production of salt, the amount in 1907 having been nearly 30 million barrels of 280 pounds, mostly made in New York, and the net value averaging 25¢ a barrel. T.

### Some Paradoxes of Modern Life

**W**EBSTER defines a paradox as a proposition contrary to received opinion or seemingly absurd, yet true in fact; and before touching upon certain of the principles of Theosophy which when adopted by the world at large will make short work of the paradoxes of modern life, it will be well to glance at a few of these incongruities which would be a source of amusement if they were not so menacing.

Perhaps the most startling paradoxes an observant visitor from another planet would notice, would be those arising from the inconsistency between the alleged mainsprings and ideals of public and private life, and the actual practice. He would find that certain ancient books and teachings, believed, or at least openly proclaimed, to be divinely inspired, are upheld by the nations of Christendom to be their guides, and that some, if not all, of these nations boast that their power and prosperity are due to the carrying out of these principles. He would find an immense army of persons supported for the exclusive purpose of teaching them, and many millions of money and a great deal of splendid energy, unselfish devotion, and heroism on the part of enthusiasts being spent to induce certain other nations which have not kept up in the race for material supremacy to adopt the dogmas of Christendom. And yet must we not admit, if we are honest with ourselves, that the wise old proverb, "Charity begins at home," has not received its proper share of attention? Although Western nations have been anxious to mind other people's business, in spiritual concerns at least, can we say that their own acts and lives have, during all these centuries, shown more than a rudimentary assimilation of the ABC of the essentials of Jesus the Christ's teachings? Is it certain that the main divisions of his followers even agree among themselves as to what are the essentials of Christianity?

And yet Jesus himself said that his followers would bear a distinctive mark, that they would always be known by the love they bore each other and all mankind, and that all who did not pronounce the right password of compassionate service had no right to stand before the world as his disciples. He was most emphatic in declaring that he would spurn them at the last, however they might cry "Lord, Lord," unless their deeds harmonized with their professions; for his Gospel was the brotherhood of man, in action, and the Fatherhood of the God within, of which the personal man is the temple. After all the ages during which Jesus Christ's doctrine has been nominally preached, can we assert that the standard of the world's life has changed materially for the better? Are there not many good reasons for supposing that a higher standard of living, taking things as a whole, was kept up at various periods in pre-Christian times? It would seem that the essentially Theosophical and life-giving teachings of Jesus have been obscured and mutilated, and the non-essentials of dogmatism held up for worship. Even the asceticism of devotees has been tainted by side-glances at the promise of personal reward and by fears of personal penalties.

While we may rejoice that there are numbers of high-minded persons striving to follow the highest ideals, it would be simply fooling ourselves to shut our eyes to the actual state of things as a whole. The philosopher who tells you that everything is going beautifully and that we are the paragon of the ages, is either blind to realities or has an extremely prejudiced and ignorant view of former times. But neither need we think our century is so much worse than any of its predecessors, at least for a long way back: there is a very strong resemblance between mankind now and a million years ago, says

one of Madame Blavatsky's Teachers. Katherine Tingley was once asked by a newspaper reporter:

"Is the world becoming better, purer, and less moved by passion? This question is asked chiefly because the newspapers here and in New York daily record an astounding list of crimes born of passion, and among officials who deal with such cases the situation is considered most serious."

Katherine Tingley replied:

"It must be apparent to the most ordinary observer that the world is not becoming better. On the contrary we have evidences everywhere of general degeneracy. The astounding list of crimes accentuates this fact. In viewing this generally deplorable situation we have absolute proof of the old Bible saying that 'God is not mocked; for whatsoever a man soweth that shall he also reap.' The mistakes of the past in private and public life have bred the present awful Karma that we are standing face to face with today."

One of the saddest paradoxes is the exploitation of children in the sacred name of business, the cruelty so many suffer from overwork and competitive overstrain, depriving them of the rights of healthy, happy childhood.

One of the most ghastly paradoxes of the age is the increase of suicide among the young, which is attributed largely to over-pressure. In spite of palliations, in the past thirty-seven years self-murder of children has more than doubled, and it is stated that the authorities believe that half the cases are not reported in order to spare the feelings of the parents. Mr. McDonald, the President of the third International Congress of Criminal Anthropology, says "Suicide is more frequent among boys than girls. The struggle for existence is more acute for boys. The excessive ambition of parents affects the boys more than the girls." And he adds this remarkable statement, which is worth close attention: "In the end of the school-year vanity and fear of punishment may have produced their results." And this in spite of "Child-study circles" in lands which profess to follow One who set a child in the midst of them and who said it would be better that anyone who offended such had a millstone hung round his neck and were cast into the sea.

In the Râja Yoga schools, now being established successfully in many countries, there is no selfish competition; emulation is the key of progress, and the teachers in those schools who are working out Katherine Tingley's plan have great cause to rejoice at the results. When trained early the unspoiled intelligences of the majority of children respond to the efforts made for their development without the unnecessary and unwholesome spur of reward at the expense of others. Early childhood is the time when the lessons of either selfishness or brotherhood are impressed indelibly; and it is then that the future happiness—or the reverse—of each man or woman is assured, for peace of mind does not depend upon "bread alone."

There is another paradox that we cannot overlook. What is that ugly deed those persons are trying to hide behind the cold stone wall of that gloomy penitentiary—a deed that must be too shameful to be done openly? Can it be they are *killing* one of their Christian brothers, and that no protest is being made by the professed minister of the religion whose Founder commanded his followers: "Thou shalt not kill"?

Capital punishment is the outcome of profound ignorance of the real nature of man, of utter materialism, of the expediency of laziness. Capital punishment appeals only to the lowest interest; the reform of the criminal is not considered, and though he is bundled out of the way as a supposed deterrent, the constant increase of murder shows it is a failure. But the paradox of capital punishment is specially absurd in view of the orthodox conceptions of a hereafter; for if the criminal has been converted and is a reformed character before his execution, as we frequently hear, is not society losing a desirable citizen? And if not, what right have those who believe in eternal punishment to thrust out an unregenerate and take away his only opportunity to repent and save his soul?

Theosophy tells us that the only way to kill a criminal is to kill out the evil nature that has taken control, even though it is a more laborious task than the brief horror at the gallows, for the soul

is untouched by the hangman's rope, and the murderer burning with revenge against society is thrust into a condition only a very little removed from earthly consciousness where he can, and does, inject evil thoughts into susceptible minds hesitating on the brink of crime.

Our best thinkers all agree that strong character is to be built up by continued efforts to gain self-control, even after many failures; but today we are startled by some experimenters in the name of science trying to reform degenerates by hypnotism, *i. e.*, by overpowering what little will-power they have and substituting that of someone else. Theosophy helps the weak to build themselves up by wholesome means. Any hypnotic practice contains inherently in itself evils worse than those it attempts to cure; and this paradox contains a great menace for the race, for its kills self-reliance and responsibility.

It would be wearisome to continue indefinitely, as we might, enumerating the ironies of the hour.

May not the failure of ecclesiasticism to build up a truly Christian civilization be partly due to the paradox of its attempt to enforce literal misinterpretations of the letter of the Bible which are known and even being admitted by daily increasing numbers of theologians to have been mistakes? Here is one of the latest admissions by a leading Congregational minister at a Church Congress in Chicago. Speaking about the miracles, he says:

"I think it safe to say that the story of the Virgin birth of Jesus is by very many no longer treated as history, but relegated to the realm of legend. . . . The resemblance to other stories, like that of the conception of the Buddha, is so strong, the connexion with the Gospels so slender, the silence of the rest of the New Testament so profound, that the Christmas stories are fast ceasing to be held among the articles of faith."

He throws similar doubt upon the Resurrection of Jesus, long supposed to be the cardinal feature of Christianity, and finally he says:

"I have said enough to show the foundation of my own conviction that the present tendency of our more liberal churches is to hold to the miraculous, if at all, by a very slender thread; . . . for ourselves, we ought at least to make ready to abandon positions that may at any time become untenable."

You will agree that this kind of thing does not strike a heroic trumpet-call for militant Christianity, and that it is an extraordinary change from the attitude of even the most advanced theology of a few years ago, which was equally ignorant of the esoteric or inner meaning of the beautiful aspect of Theosophy called Christianity. In Germany the movement towards complete denial of the orthodoxy of yesterday by the orthodoxy of today is very rapid, and that suggests another paradox, for modern Science, which has done invaluable service in breaking down superstition and liberating mind, threatens in its turn to become a tyrant. It has brought its own dangers, one of the greatest of which is the rigidly logical carrying out of the popular cry of "the struggle for existence and the survival of the fittest," a rule founded upon the false assumption as regards *man*, that he is merely the highest member of the animal kingdom and has no soul. The perversity of the human mind must have a formula to abuse, and we are in danger of finding that materialism can provide excuses for as ruthless a tyranny as that of Calvin or of the Inquisition. The materialistic answer to the Riddle of the Universe has been carried much farther than the eminent Darwin went, and is leading the masses of the more educated people to the false belief that there is nothing but brute force unintelligently guided, in Nature, resulting in pessimism and leading back by reaction into new superstitions.

Emil Burnouf, the greatest French Orientalist of the Nineteenth century took an intense interest in the promise of the Theosophical Movement, for he had a vivid perception of the dangers of materialism. In the *Revue des Deux Mondes* of July, 1883, in a magnificent article upon Theosophy, he calls upon it to render humanity an immense service by showing the existence of a law superior to that of the struggle for existence. Theosophy answers this call, and in its philosophy and practical application it shows that mankind makes progress by the application of a higher law of love and sacrifice. C. J. R.

## From ULYSSES

THERE lies the port: the vessel puffs her sail:  
There gloom the dark broad seas. My mariners,  
Souls that have toil'd, and wrought and thought  
with me—

That ever with a frolic welcome took  
The thunder and the sunshine, and opposed  
Free hearts, free foreheads—you and I are old;  
Old age hath yet his honor and his toil;  
Death closes all: but something ere the end,  
Some work of noble note, may yet be done,  
Not unbecoming men that strove with gods.  
The lights begin to twinkle from the rocks;  
The long day wanes; the slow moon climbs: the deep

Moans round with many voices. Come, my friends,  
'Tis not too late to seek a newer world.

Push off, and sitting well in order smite  
The sounding furrows; for my purpose holds  
To sail beyond the sunset, and the baths  
Of all the western stars until I die.

It may be that the gulfs will wash us down;  
It may be we shall touch the Happy Isles,  
And see the great Achilles, whom we knew,  
Tho' much is taken, much abides; and tho'  
We are not now that strength which in old days  
Moved earth and heaven; that which we are, we are;  
One equal temper of heroic hearts,  
Made weak by time and fate, but strong in will  
To strive, to seek, to find, and not to yield.

—Tennyson

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

## Question

What is the teaching of Theosophy in regard to the increasing manifestation of psychic powers? If these powers are detrimental to mankind, why have they been revealed, or why has mankind been permitted to develop them?

## Answer

Apples ripen in autumn, and there is no question of their being revealed to the earth by some supernatural power, miraculously. A revelation and a wonder they are, and all things are that unfold themselves out of the unseen; yet must we count on the eternal action of law; not holding this to be a dead thing because of the stability of its action. The seed was sown in its own time, and the fruitbearing limb was grafted on the wild stock; and thereafter the tree grew and year by year came the pink snow of the blooms and the little golden suns that fill the valley with their scent—result of the spirit and will of the apple trees, shall we say; at least of whatever there is in them of life, self-existence, even consciousness; wrought upon by wind and weather, sun, rain, cultivation, fertility, and so forth. And the deadly nightshade grows too, and bears its own crop in its own time; and there is no power to step in and prevent the blooming of the nightshade.

So it is with the psychic powers and senses of man. The seed of them was sown when first man was, that the fruit might ripen at its right time; for without it the perfect work of our evolution would be left incomplete. How long it may be from the time the first fruit sets to midharvest, who shall say? Perhaps thousands of years or millions; perhaps only centuries, or less still. But from the time the blossom has fallen, there will always be found fruit hanging within the reach of the long-legged, the adventurous and the greedy; and there will always be those who can convince themselves that unripe fruit is palatable

and to be desired. In so long a time, or so long, the psychic powers will be ripe and legitimate for our use, meanwhile to eat them before that time means disorder, often as serious as death. Are the masters of the orchard to fell the trees (supposing it possible for them to do so) because fools will come by in spite of all warnings and scarecrows, and gorge themselves upon unripe fruit?

The apples are good enough when they are ripe, and perhaps we may say that there is no forbidden fruit except the unseasonable. There are of course poison crops, courses outside the whole scheme of evolution, elements in a sense extracosmic, brought into life by human or superhuman malice; these we must kill out as we may, fighting against them in season and out. For humanity has the power to engender, and humanity has brought into being all those things, which are neither animal nor divine. Yet apart from vices, all our unfoldment and possibilities are right in their due time and place.

The black load of the world's transgression and misery is huge enough now; heaven knows if any increase of such a burden could be borne. The sinner will sin the more, the more scope he has for sinning, and evil is most to be dreaded where it is most free to be itself. Why should we be given another world to ruin, who have so deeply stained and scarred this present world with our ill-doings? We have gone so far hell-ward with merely physical matter; how far short of that goal should we go, if we had psychic stuff to abuse as well? You were only able to hurt yourself so much with the ounce of gunpowder you had as to burn off your eyebrows and singe your hair a little in front; but that was warning enough that we should not make you free of a barrel or two of nitroglycerine. Albeit those barrels are there; you ought to have knowledge that they are there, that you may do your part and beware of them. And though we do our best to keep you away from them, we shall not be able to keep you away from them in all cases, if bent on the search; nor to hold you from playing with the stuff if that be your aim; nor to set the fragments of you together when the inevitable has occurred.

Man is ultimately his own master; if he has sufficient hold of the will he can do anything; may set himself upon any path and follow it to the end of bliss or misery. We are greater than the Law of the Universe in that we can transgress against it; the Law is greater than we are in the inevitable rebound. We may sin, but if we do, we must suffer. We have free will, and may eat the forbidden fruit or leave it till it ripen on the tree. But whoever eats, the doom shall be pronounced against him; he shall go forth from some Eden to meet the perils and bleakness without. It is better for average man to march with his kind along the ordered evolutionary track, than to fall out and take his leisure in fool's paradises to the left hand. You may do so if you will; but what of the time when the last footfall shall have passed you and crossed the dim horizon, and you are left lonely and naked in the wilderness?

S. F.

THE first duty taught in Theosophy is to do one's duty unflinchingly by every duty.—H. P. Blavatsky

## Theosophy not New

INQUIRER. Theosophy, then, is not, as held by some, a newly devised scheme?

THEOSOPHIST. Only ignorant people can thus refer to it. It is as old as the world, in its teachings and ethics, if not in name, as it is also the broadest and most catholic system among all.

INQ. How comes it, then, that Theosophy has remained so unknown to the nations of the Western Hemisphere? Why should it have been a sealed book to races confessedly the most cultured and advanced?

THEO. We believe there were nations as cultured in days of old, and certainly more spiritually "advanced," than we are. But there are several reasons for this willing ignorance. One of them was given by St. Paul to the cultured Athenians—a loss, for long centuries, of real spiritual insight, and even interest, owing to their too great devotion to things of sense and their long slavery to the dead letter of dogma and ritualism. But the strongest reason for it lies in the fact that real Theosophy has ever been kept secret.

INQ. You have brought forward proofs that such secrecy has existed; but what was the real cause for it?

THEO. The causes for it were: *Firstly*, the perversity of average human nature, and its selfishness, always tending to the gratification of *personal* desires to the detriment of neighbors and next of kin. Such people could never be intrusted with *divine* secrets. *Secondly*, their unreliability to keep the sacred and divine knowledge from desecration. It is the latter which led to the perversion of the most sublime truths and symbols, and to the gradual transformation of things spiritual into anthropomorphic, concrete and gross imagery—in other words, to the dwarfing of the god-idea and to idolatry—H. P. Blavatsky, in *The Key to Theosophy*

"THERE is a *personal* God, and there is a *personal* Devil!" thunders the Christian preacher. "Let him be anathema who dares say nay!" "There is no personal God, except the gray matter in our brain," contemptuously replies the materialist. "And there is no Devil. Let him be considered thrice an idiot who says aye." Meanwhile the occultists and *true* philosophers heed neither of the two combatants, but keep perseveringly at their work. None of them believe in the absurd, passionate, and fickle God of superstition, but all of them believe in good and evil. Our human reason, the emanation of our finite mind, is certainly incapable of comprehending a divine intelligence; an endless and infinite entity; and, according to strict logic, that which transcends our understanding and would remain thoroughly incomprehensible to our senses cannot exist for us; hence, it does *not* exist. So far finite reason agrees with science, and says: "There is no God." But, on the other hand, our *Ego*, that which lives and thinks and feels independently of us in our mortal casket, does more than believe. It *knows* that there exists a God in nature, for the sole and invincible Artificer of all lives in us as we live in Him. No dogmatic faith or exact science is able to uproot that intuitional feeling inherent in man, when he has once fully realized it in himself.—H. P. Blavatsky

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

## Navigating the Air

*ἀερόβατον καὶ περιπλοῦν τὸν ἥλιον.*

"I walk the air and contemplate the sun."—Socrates, in *The Clouds*, line 225 (Aristophanes)

**E**ARTH is fixed both in form and volume; water is fixed in volume, but not in form; air is fixed neither in volume nor form. Man is for the most part a dweller in the earth and the water. His ordinary consciousness is of the earth, for it deals with fixed quantities, rigid forms, and what are called "hard facts." From time to time he escapes from this region of hard facts into another region where things are fluidic and mobile—the realm of fancy and dreams. This is pleasant and adaptable, but it still possesses the earthy quality of gravitation; it is the water element. To gain the power of walking the air, like Socrates, we have to be able to overcome the force of gravitation.

The four elements constitute a favorite symbol of the ancient Science. The earth may be said to correspond to our materialistic life with its fixed forms and "hard facts," its straight and rigid ideas, its contact with matter, its fear of cutting loose. The water corresponds to our psychic and emotional nature: the air to the soaring intellect, though strictly speaking, pure intellectual fire belongs to *aether*; the fire to the fires of enthusiasm and devotion. Or we can take the mind only and divide that into four grades corresponding with these four elements. The earthy mind is of course the ordinary "matter-of-fact" reasoning mind which loves to think in set terms and reach definite conclusions, calls for "proof" and certainty, and fears the in-finite and un-measurable. Then we have what may be called the fluid mind, which seems to answer more to what has been called (perhaps rather ungenerously) the "feminine mind," where the boundary lines are not marked and the forms fluidic; or perhaps to one kind of "artistic temperament." But our dreams represent the watery element most; for like water they are perfectly fluidic and yet they gravitate to earth. This lower psychic nature is not spiritual; it is still earthy.

But we cannot mark off things into hard and fast divisions; there are endless combinations of the four primal elements. We might say that the ordinary religious temperament is a compound of fire and earth, of zeal with

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

materiality of thought. We might attribute the wild fanaticism, ending in sensuality, of certain forms of religious enthusiasm, to an overplus of the watery element, rendering it unstable.

We need to cultivate more the airy element, free, untrammelled, soaring away from contact with earth. The air is the vehicle of light and fire; it is the blue aether of heaven wherein glow the sun and stars. The air element in our constitution is the spiritualized Mind, which is the vehicle, the vesture, of Spirit. The true Light and Fire of the Spirit can only manifest itself in purity through the purified and sublimated Mind; filtering through grosser strata, its rays become dulled and tinged, its radiance turns to lurid heat and we get the earthy fire.

It will be quite a new idea for some, that we have these higher strata in our nature. The exploring them is a matter for Science, but not ordinary physical science. In physics, gases were discovered by our civilization quite recently, and later still we have been investigating the properties of still finer forms of matter whose main quality is light. But in our inner nature we have cultivated principally the earth element and to some extent the water. The pursuit of "psychism" may be described as a pursuit of the watery element. "Psychism" is not elevating; its votaries are still filled with materialistic ideals, of self-advantage, and gain. But the "sea" is full of strange monsters, hostile to mariners, and of storms and whirlpools that engulf.

Spiritual knowledge is airy; it is expansive and elevating, it soars away from the bondage of earth; it offers a free passage to light which it diffuses around. True Theosophy may be compared with the air element.

To navigate the air we have to learn to cut loose from familiar moorings and trust ourselves to the buoyant power of the pure aspiration within us. We have also to be immune from the influence of the lower air-currents

which would blow us hither and thither, particularly as we are so light. The people who are learning to acquire the flying instinct have to cultivate the same qualities (in one sense) as do those who are learning to navigate the inner air.

The difference between the earthy mind and the airy mind is a noteworthy one; it is the

difference between materialistic ways of thinking and spiritual ways. All our speculations, whether religious or scientific or otherwise, are tinged with materialism. There is the same tendency to think in rigid lines, to grasp definite ends, to see our way clearly before us, not to trust to chances, to make sure of safety, to make formal creeds.

One great obstacle to navigating the air is that our machinery is imperfect and heavy. So perhaps great Teachers are not so far wrong when they exhort their disciples to leave all if they would enter the realms of light. We cannot navigate the air if we insist on taking all our heavy personal baggage.

Another obstacle is that we may make the machine *too light*, so that it is blown about and has not enough force to make way against the slightest breeze. This is the visionary.

Can we learn to fly in an inner sense; to live in an air, free, buoyant, glad as the bird, bathing in sunlight? Yes, if we can manage to lighten ourselves by dropping that heavy personal baggage of selfishness and fear. We know that Socrates, who at times seemed to tread the air, was a man who had rendered himself independent of most physical needs, and; what is more important, had liberated his mind from all the clogging prejudices. He did not worship any exterior God, he had not a *set* religion; and he trusted in the innate power of human nature. His perfect faith buoyed him up; he lived in the air and scorned the earth, neither desiring to leave it nor to stay on it. If we could find out this innate power of human nature and cultivate it and learn to rely on it, we should find freedom.

And those beautiful myths of antiquity, which people so foolishly imagine to refer to cosmic phenomena and to nothing else, those gods of the air and sky—were they not originally and before their perversion and misunderstanding, the symbols of the Sacred Science which taught how to realize the powers of man's nature? STUDENT

## THE THEOSOPHICAL ADDRESS AT ISIS THEATER

THE meeting of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY held in Isis Theater last Sunday evening was in every way a most interesting one. The speaker, Mr. Kenneth Morris, who had for his subject "Foreshadowings," was listened to throughout with the closest attention.

The music, provided by some of the Râja Yoga students, included the following:

Quartet.	Allegro, fr. Quartet.	Ipolitoff Ivanoff
Violin Solo.	Andante et Scherzo.	F. David
Quintet.	Intermezzo.	Boisdeffre
Quintet.	Norwegian Dance.	Grieg

The speaker at the opening of his paper, referring to the condition in France before the outbreak of the Revolution, said that the present day was an even more momentous time, not that it follows that there is likely to be any catastrophe or that the results will necessarily be evil, but that it behooves every right-minded man in the world today to awaken to the facts of current life and to realize their meaning, and to question himself as to what he can do to meet the needs of the world. The speaker then made reference to the power that Christianity has been during the greater part of the last two thousand years, until the Christian peoples have, save within the last few years, regarded themselves as the only people on earth and have measured everything from their standpoint. Now, however, there is an awakening to the vast periods of antiquity and to the civilizations that in time and in the grandeur of their achievements have been vastly greater than our own. What was it that caused their final decay? What is it that has caused the downfall of the nations of the historical period? And though some of the ancient races may have lived through the whole allotted course of their lives, how many have come to the full flower, and how many have been blighted in the bud because of their departure from truth? If any nation has lived to the end or is now to live to the end of its natural life, it must have based its history on spiritual and elevating canons of living. If it has not or does not do this, its downfall is assured. We need to understand the law of Karma. We need to base our living on the sure and fixed foundation that it gives. All time is before us; all past ages behind. Have we not time and scope, then, to do things well?

Today we are assailed by all manner of things, many of which are evil, certainly, but many others are evil also, though we have not yet recognized them as such.

Ancient races failed through their failure to solve such problems as are now being presented to us to solve. What shall we do? Just go on with our efforts of making money? Just go on letting things slide? Shall we be such fools as that?

In conclusion the speaker referred to the work of the Theosophical Movement and the Râja Yoga system of education. "Well for us," he said, "well for the world at large that H. P. Blavatsky brought back the knowledge of the Theosophical ideals; that William Q. Judge spread and guarded them; and that Katherine Tingley has established them at Point Loma, where these true and mighty ideals are being worked into the warp and woof of human life." OBSERVER

## What is a 'Gentleman'?

WE have still a few words which express ideals of human perfection disconnected from accepted religious ideas of perfection, and one of these is the word *gentleman*. Whatever secondary meanings this word may have, it is generally understood to signify in its best sense a very high ideal of honor, courtesy, chivalry and discretion. And yet this high standard is quite distinct from the religious standard. A man may be pious and a gentleman; but the two do not necessarily go together.

It behooves us to consider how it comes that there should be this splendid ideal of manhood apart from the religious ideal. To find an answer one has to go back to the times when *Chivalry* constituted an ideal quite distinct from that inculcated by the ecclesiastical influence, and even opposed to it, though the ecclesiastical power later on succeeded in getting control of chivalry and deflecting it into ecclesiastical channels. We must go back to times when there yet lingered in Europe traditions of a spirit derived from its ancestors before the introduction of Christianity from the decaying Roman Empire; a spirit bred in the warlike and chivalrous races that overran that empire, and which they had derived from their own ancestors. Tracing this back, we find its origin in the ancient beliefs of these peoples as preserved to some extent in such books as the Scandinavian *Eddas* and the Finnish *Kalevala*, and in the many legends of Arthur, the Knights of the Grail, Parseval, etc.

Whatever Christianity may have been in its origin, it is certain that it later on developed a spirit that was considered to be the reverse of manly and chivalric; and we have only to read later Roman history to see what kind of people some of these representatives of Christianity were and what kind of spirit they fostered. This spirit was considered by the Pagans to be abject and servile, and to breed in man a want of self-respect and a *cringing attitude before life*. The influence of the medieval church brooded like a nightmare over our period of formation and destroyed the prior learning and literature that might have preserved for us a reliable record of those former times.

The word gentleman and the ideals it stands for point back to times when the standard of perfection was not set by what we now understand as dogma, but by something else which was *religion in another and wider sense*. A knowledge of the Divine Origin of man and of the Divine potentialities ever present in him was the kernel of this ideal. In those old myths we find the figures of Gods represented as men of superior attainment: of men becoming *Heroes*, and *Heroes* becoming Gods. The condition of admission into the ranks of the *Heroes* was the performance of Deeds, in which conquest over the Dragon of selfishness, passion, and delusion, played the chief part.

A gentleman was a man who had mastery over his own lower nature and was therefore gentle, valiant, and wise. To achieve this communion with his own soul he had no need of the mediation of any ecclesiastical system or priesthood; the teachings as to the Divine nature of man were accessible to him. Still less would he embrace any ideal that taught the

ineradicable sinfulness of man; for, though he would believe in evil in man, he would also believe in Man's innate Divinity, by which he has power to overcome that evil. The only savior would be the Higher Self of man, the fire of Deity within the Soul, destined to redeem man from the lower self.

It is well, then, to remember that we have sanctions and incentives for the highest endeavor, outside of religion as ordinarily understood. These sanctions and incentives rest on the eternal truth of man's Divinity and his power to approach it by his intuition and aspiration. *Religion* is far older than religions; and what is good in religions has been derived by them from Religion, of which they have undertaken to become the dispensers. And this duty they have usually fulfilled but ill, concealing from man much that he should have known and oftentimes converting his manly self-respect into doubt and self-abasement.

In the above remarks the word Man has of course been used as inclusive of both sexes. Though the ideals of perfect womanhood may differ in detail from those of perfect manhood, the spirit is the same; nor will any discerning mind be rash enough to try to establish any superiority of one sex over the other. It is easy to translate what has been said about the gentleman into the corresponding terms as to the ideal gentlewoman. STUDENT

## Are You an Echo or a Voice?

He who floats with the current, who does not guide himself according to higher principles, who has no ideal, no convictions—such a man is a mere article of the world's furniture—an echo, not a voice.—*Amiel*

EMERSON, Carlyle, and many others have preached independence of character, initiative; the world is weary of preaching. But there is not room enough within the limits of conventional thought, whether on religion or science, for originality.

Theosophy opens out a new world, full of invitation and opportunity; and the earnest student is positively born anew. He can begin to realize all these exhortations, and make them actual instead of a mere shining film on the surface of muddy waters. For Theosophy has *definite* teachings about the higher nature of man—teachings which will prove their truth not only by their sweet reasonableness, but at the stern bar of fact. STUDENT

## Fireless Locomotives

STEAM locomotives without any fire are gaining an increased use in places where fire would be dangerous, as around mills for the manufacture of inflammable goods; and where the engines do not have to go far from their base of supply. The engine consists only of boiler, cylinder, and mechanism, and one man can work it. The boiler is filled three-quarters with water, and then steam is forced into the water from the power-plant. This superheats the water and raises the pressure to the same degree as that in the feed-boiler. The engine will run for from four to five hours, doing shunting work. The pressure continually lessens; but, owing to the bore of the cylinders being extra large, work can still be done at pressures of one or two atmospheres, and the engine can crawl to its feed under a pressure of from one-fourth to one-half an atmosphere. T.

### Astronomical Paradoxes: A Lunar Mystery

ONE of the most interesting of the unsolved problems of astronomy is brought to mind by the suggestion of an amateur that the shooting stars or meteorites are closely connected with the earth, revolving around it at no very great distance from the equatorial region, something like the myriads of particles which are supposed to constitute the Rings of Saturn. According to this theory, meteorites do not come from the outer regions of the Solar System. This revolutionary suggestion that there is an immense ring of scattered meteorites traveling around the earth, from which a certain number of individuals are constantly falling to earth, has something to recommend it, but it does not explain the cause of the numerous streams of meteors which come from *different* well-marked directions in space, at regular intervals year after year, such as the famous August and November displays.

The lunar problem, upon which the theory of the limitation of the great mass of meteorites to the close vicinity of the earth may throw some light, is this: How can it be that if a terrific hail of meteorites — large masses of ironstone moving with a planetary velocity — have been bombarding the moon for ages, we see no evidences of them in the shape of smoothed surfaces of hills, and a uniformly dark color covering every level surface? As a matter of fact the contours of the lunar mountains are extremely sharp and definite, and — above all — the gray plains are diversified by numerous brilliant white streaks and spots, and intersected by unfilled cracks and chasms of various depths. There are supposed to be, at a conservative estimate, ten million meteorites of various weights, from half an ounce upward to many tons, falling upon the earth's atmosphere hourly. Although the moon's surface is much less than that of the earth, the bombardment crashing down upon it must be much greater, for our companion planet is unprotected by a dense atmosphere like that which preserves everything on earth from quick destruction, and the meteorites strike its surface with undiminished velocity — *i. e.*, if they are traveling in space in the vast quantities required by the accepted theories of astronomy. There is no known reason why the moon should escape the incessant battering of these cosmic missiles; and yet, why are not the cracks and craters filled up by the debris, and how is it that the brilliant white streaks and patches on the level plains are not covered by a uniform drab or dark brown deposit? There has been plenty of time for action of this kind. Y.

### Reincarnating Gout

“WELL, and how long have you had it?” said the cheerful doctor to the patient who came consulting him for gout. “Oh, about twenty-six thousand years,” was the reply.

Men may come and men may go, but appendicitis, gout, rickets, uric acid and the other things remain. And the proof is in some ancient Egyptian relics which will shortly be on exhibition at the English Royal College of Surgeons. They are from fifty-seven cemeteries and cover the ages from the prehistoric to the early Christian. Some mummied abdominal organs indicate that the lamented lady died of appendicitis. Another set of remains indicate that the original tenant had

College of Surgeons to prove it. He remarked that he could not see that surgery had made much progress since that day, for fractured bones were splinted and bandaged exactly as now. ABUKIR RAMESES DOE

### What Becomes of Fire When it Goes Out?

“WHAT becomes of the fire when it goes out?” is a child's question never satisfactorily answered. Science tells us that fire is matter in a state of very rapid vibration; hence the fire is only an abstraction, and disappears altogether when the vibration slackens. In the same way light, sound, and other universal and essential things are considered as abstractions — modes of motion,

Lomaland Photo. and Engraving Dept.

IN THE FOREST, KINNEKULLE MOUNTAIN, SWEDEN

lived with, and possibly died of, gout; crystals of uric acid thousands of years old were there about the joints to prove it. The victim has doubtless reincarnated some few times since then, and we infer from the above fragment of conversation, which we cut from a medical journal of A. D. 2008, that he has persisted in the habits which awakened the gout and that it therefore purposes to sojourn cordially with him in every life he lives until he has learned to behave better at the dinner table. At the date of the newspaper cutting which we quote, the power of remembering earlier incarnations had evolved in quite a number of people in all nations; and so this patient was able to recall that altogether he had taken 178 pounds of phosphate of soda and drunk 2,000,000 gallons of hot water. But he had, alas, failed to drown his gout. The children of some Hyksos friends of his had suffered from rickets and their mummies are in the hand of the

forms of energy, more or less interchangeable.

The old “phlogiston” theory said that when a thing burned, phlogiston went out of it. Now we say that energy goes out of it. But the older scientists thought their phlogiston was an actual substance; they were nearer the truth, like the child.

If fire is a form of energy, then not only must the energy pre-exist but the form also, just as the form of the oak exists before the life in the seed builds up the material substances on it. Everything that comes into physical manifestation has existed beforehand as a (physical) potentiality. There is an invisible fire, of which the visible fire is a manifestation; the physical or chemical means does not *create* the fire, but only affords the conditions for its manifestation. So also with light, electricity, etc. Behind every phenomenon is its noumenon, and that which perceives, through the senses, is of the same order. T.

## Welsh Literature—Prose—Eighth Article

ROMANCES IN THE RED BOOK OF HERGEST  
THE ARTHURIAN CYCLE

WHEN Culhwch rode to the palace of Arthur to get help in obtaining Olwen, the daughter of Yspaddaden Pencawr, he invoked not only Arthur himself, but also all the warriors and ladies of his court. Right in the midst of his speech is given a list of them all, and hardly anything in Welsh literature is so suggestive and magnificent as that list. It is a grand series of fragments; as Matthew Arnold said, peasants' huts built of the stones of ruined Ephesus, with marvels of carving and tracery appearing in unexpected places. Perhaps the man who finally committed the story to writing had only poetic intuition and literary sense to guide him in his work, which served to keep it pure of Normanism, but not to replace what of meaning and structure had drifted away. The meaning glimmers through like sunlight between the leaves of an oak wood: once, the whole plain would have been flooded with its purple and gold. The suggestion of this long list of names is that Culhwch, setting out on the quest of quests (to obtain union, that is, with his own higher self) draws the whole universe into his warfare; invokes the soul and all the powers of the soul, so that there is nothing left but what is either for or against him. In brackets after many of the names are given the peculiarities of the hero mentioned, and in these descriptions humor and poetry jostle. The keenest vision, the most alert power of mental discrimination and insight must be attained by the traveler on this quest; so we shall see invoked "Drem the son of Dremidydd (when the gnat arose in the morning with the sun, Drem could see her from Gelliwic in Cornwall as far off as Pen Blathaon in the north of Britain, and Esgair Oerfel in Ireland)." This man could suck up the sea on which there were a hundred ships, so as to leave nothing but a dry strand, so broadchested he was; then again that other hero spread his red, untrimmed beard over the eight and forty rafters that were in Arthur's Hall. Another, on the day he went upon a message, never sought to find a path. If his way lay through a forest he ran along on the tops of the trees; during his whole lifetime the blade of reed grass bent not beneath him. Another could clear three hundred acres at one bound; the chief leaper of Ireland was he. At last Culhwch and his companions, whom

Arthur had sent to aid him, find the castle of Yspaddaden, and Yspaddaden himself, an inert and bearded giant who is to die on the day of his daughter's wedding. Olwen is not to be gained except such and such feats be performed; some thirty-five impossible adventures are to be achieved, each involving the help of Arthur or some of his long list of warriors. Long forgotten divinities were found, great giants slain and wild monsters hunted, before the end. The sun shines and the north wind riots through it all; it is strewn with records of the inner life of all seekers after self-knowledge and self-mastery. The *Dream of Rhonabwy* follows in the

Next we have the story of Peredur Mab Efrog—mayhap the original of Perceval and Parsifal. It stands halfway between the Welsh and Norman ideals. The Grail cup is still the Cauldron; in earlier times or in purer cycles of story the Cauldron of Ceridwen, Mother of the World, the Cauldron of Universal Regeneration. Peredur and Perceval would hardly be recognized as the same man, but the first is Cedur, the Companion, and the second Cyfaill the Friend, of Pair, the mysterious Cauldron; such is their etymology. It was said that if a dead man were put into that cauldron he would come to life; with a new name, be it noted; and dumb, unable to speak of the

ULLSWATER, WESTMORELAND COUNTY, ENGLAND

wake of *Culhwch and Olwen*, and breathes the same spirit; although its date is well fixed as a medieval tale. A Welsh soldier under Madoc ap Maredudd of Powys was on an expedition into England; with three companions he slept a night in a strange house on the border. For well-defined reasons he found no rest on the sleeping-bench, and lay down on a yellow calfskin mat beside the fire. "It was a main privilege for anyone to sleep on that yellow calfskin mat." Whoever slept there would go out in his dreams to the realm where Arthur was with his men, awaiting the time of rebirth. He saw them all; and saw too the ruby in Arthur's ring, sight of which enabled him to remember all that he had seen. Many visit the Emperor Arthur in their dreams; only those who obtain sight of the jewel remember their privilege. The story is of interest for the light it pours on the life and aspirations of the people at that time.

past or of the mysteries beyond death. But in this story it only appears and is not explained; it is a piece of wreckage thrown up, to tell where the treasure galleon is lying. There are here but the faintest echoes of the old Theosophy. Welshmen perhaps had told it to Normans, who misunderstood it. These daubed it about with details and retold it to Welshmen who had lost the old keys; what we have here is the re-telling of it by these latter. The "Grail"-myth also came from the East and Persia, and the German Minnesingers wedded it to the once Welsh, now Norman story.

Lastly come the tales of *Geraint ab Erbin* and *The Lady of the Fountain*. These are purely Norman in spirit; you will read in them of love-making and of the relations of this personality to that. The only things that remain Welsh about them are their color and vividness.

A WELSH STUDENT

**H**ER home was in the city. You all know her, this young woman of whom I

speak, for she was born just as you and I were born, she loved her family and friends just as you and I do; she had a firm conviction that the American Constitution proclaimed the truth in stating the God-given right of everyone in this world to be happy, and in this search for happiness she lived many incarnations in one life.

As a child, like many another, she was surrounded with an atmosphere of music and flowers, love and sunshine, until there came a winter of snow and ice, great drifting piles of snow, and into her home came that strange thing, Death, taking away the beautiful light in her mother's eyes and the music of her voice.

After this, a shadow brooded over the home, and the shadow made the child ill. She was placed in the care of physicians. With the passing of years the story added, chapter by chapter, the trial of every known school of medicine, the traveling in winter to the South and in summer to the North, the mountains, the sea, now valleys, and now hills; but the sunshine could only be seen in fitful flashes like rifts in the ever deepening shadow. No one could explain it for everyone was involved in it, until the great shadow seemed to be all that there was of life. Life seemed bounded by pills, powders, and lotions, tonics, restoratives and diet. Beefsteak and hot water now, dry toast and cereals some other time; then a trial of nuts and fruits; eating very little at a time, and often; a starvation diet of cold water; two meals a day; one meal a day; heavy breakfast and a light luncheon and dinner; the heavy meal in the middle of the day and light meals morning and evening—a ceaseless, merciless "merry-go-round" of everybody's remedy and no man's cure.

Then came the "Dress Reformers" and began a régime of "hygienic" garments of wool,

## Many Incarnations in One Life

of linen, of silk; heavy undergarments and light outside clothing; light underwear and heavy outer garments; shoes with high heels, shoes with low heels, shoes with no heels at all.

"Why do you worry about food and clothes," cried the Mental Healers at this juncture, "instead, give your whole attention to your mind. There you will find both cause and remedy. There is no need for faith if you will but let us undertake your case. Give us one year's

**I**S Theosophy Christianity? That depends upon what is understood by Christianity. Theosophy admits that the founder of Christianity was an exceedingly noble and great teacher; he was a Theosophist, he lived a Theosophical life, and he taught Theosophy. Anyone who carefully studies the teachings of Jesus of Nazareth and lives in harmony with them will be sure to live a Theosophical life. But Theosophy cannot, however, be identified with what is generally accepted as Christianity, as the latter has been too much interwoven with doctrines that are not true.

Theosophy is Divine Wisdom, the wisdom of Religion. It is found as a kernel in every religion that strives towards the light, and all the great religions of the world have their origin in Theosophy.

—Katherine Tingley  
in a lecture given in Sweden in 1907.

trial, personal treatment daily for one month, absent treatment for the rest of the time will be just as effective, and will cost but a dollar a treatment."

"Try this magnetized paper," said other loving friends, "it is prepared by a famous magnetic healer who can cure you in this way at any distance as well as by personal treatment."

"Of course I have no desire to interfere with what you believe, but I can assure you," said the Christian Scientist, "that I have had so many demonstrations of truth in my own

case and in the cases of people I know. Just let me read from *Science and Health* to show what

I mean, and if you would just sit quietly for fifteen minutes and not oppose your will to mine, although of course I am not a professional, I can really get marvelous cures at times, and I would so much like to prove to you the true value of Christian Science."

"Oh no! the Rest-cure is the sole remedy for nervous prostration," proclaimed the strong-minded advocate of sanatoriums.

"I can give you the address of the only qualified person I know, a true psychologist, who will give a course of lessons that you simply cannot fail to find beneficial, and it will give you the power to cure others as well as yourself," said the person of "psychic" attainments.

"You don't want to get into that kind of thing, you are too introspective," said the college friend, "come, join our settlement and work in the slums. It's great fun and the best kind of experience. It offers the only cure for social evils today, and is the sure method of curing the sickness so prevalent everywhere."

Oh, ye powers of light that shone in the rose-garden of childhood! Has the joy of life ceased for poor suffering humanity, worn, confused, weary unto hopeless despair, plunged in the mad whirling shadow of fads and fancies, the unrealities of life?

No! for a point of light gleams in the shadows. The Wisdom-Religion—Theosophy—rises above the waters in the clear atmosphere of purity and love, untouched by the great snowdrifts and perishing cold of the wintry life of humanity. The happy light is ever present, and the voices of unselfish workers sing out in the music that alone can gladden the heavy-hearted children of earth by helping them to cast off the shadows that burden the heart-life, and by letting in the glowing light of health and happiness and peace, the light of soul-life. ELIZABETH WHITNEY

### In Old Nürnberg

THE oldest building of Nürnberg is shown here. It is known as "the five-cornered tower" from its pentagonal form, or "alt Nürnberg," showing that what today seems "old Nürnberg" is in reality new compared with this pentagonal tower, which rises like the parent crystal from amidst the clustering roofs and towers of the Burg and city. If its walls could speak it would relate of stirring times; for Nürnberg, though not so old as many German cities, which were first Roman camps, was from the beginning a favorite resort of German Emperors, and thus early became a center of activity. This tower belonged to the original group of buildings erected on the Burg, nearly all of which were demolished in the storms that swept over it, and had to be rebuilt.

This pentagonal tower felt the shock of the struggle between the Emperor and the nobles, between the Empire and the church, between the nobles and the citizens, between the patricians and the hand workers. It saw the rise and growth of commerce and industry; it heard the tuneful songs of the Minnegesang, and the measured strophes of the Meistergesang; it witnessed the triumph of art and industry over outlawry and idleness, and, greatest wonder of all, the peaceful declaration of the city for the Reformation of Luther. It looked down upon the army of Gustavus Adolphus quartered within the friendly walls of the city. In later times it vibrated to the sound of the first locomotive drawing a train of cars in continental Europe. It still stands to witness the New Order of Ages implanted in the heart of the old Imperial City, which shall spiritualize its life and win its higher freedom. This old Nürnberg tower is an interesting link between the older order of ages and the present. STUDENT TRAVELER

brave hearts from discouragement during the dangers and hardships of those perilous times.

The modern spinning wheel is said to have been invented in Germany as late as the Sixteenth century, but spinning is probably the most ancient of all the crafts. The very earliest Egyptian monuments picture the primitive spindle and distaff, and the myths and legends of all peoples contain frequent references thereto, in various ways. We remember in the story of Helen and Menelaus how they became reconciled after the fall of Troy and, in endeavoring to return to their native land, how they were tempest-tossed and driven from

satisfying the human heart. There may be basis for a question as to whether the up-to-date woman of today in her expensive gown, which perhaps cost her no greater effort than merely the placing of the order for it, is really happier than was her quaint little great grandmother in simple homespun, produced from start to finish by her own hands. STUDENT

### Jottings and Doings

(From a Student's Note Book)

PHYSICIANS have been puzzled by the results of the thirteen-mile swimming contest recently held in an Eastern state, at which the two young women contestants were found to be in far better physical condition after the long swim than any of the men who entered. Yet a number of the men were professional swimmers, which the young women were not. Only one physician has so far published his theory as to the cause, and it is, briefly: that the strain of the contest was not due to physical fatigue so much as to the exhaustion from long-endured cold, and that while the men were all so much stronger and more muscular than the women that they could have out-classed them easily in any physical endurance contest on land, from walking to sawing wood, they did not have beneath the skin and protecting the muscles the layer of adipose tissue which the healthy feminine frame is rarely without. This was sufficient to minimize the severe effect of chill and exposure—hence the result, and another mystery has been solved!

SWIMMING has become in England a favorite pastime for women. Recently one of London's Mayoresses entered the lists in a competition and won four gold medals for swimming and diving.

London is one of several among large cities in Europe in providing fine swimming pools, where women may go with safety and

propriety, in different sections of the metropolis. One little girl of thirteen holds a record as a life-saver. Queen Alexandra is known as a patroness of the art, and King Edward has given a silver challenge cup which is competed for every year.

A YOUNG girl recently set an example of common sense, courage, and compassion that deserves to be emulated by all who might make life a less frightful ordeal than it often is to dumb animals. The cry of "mad dog!" rang out one day in a little eastern city and the principal street was soon cleared of frightened humans as a large black dog, evidently in great pain, dashed down it—cleared, that is, of all but this girl to whose feet the poor beast crawled and looked up, whining piteously. She stooped down over the suffering brute and in an instant had removed from its mouth a bedraggled but very angry hornet. And it all meant no bravado, no risk—only kindness discrimination, and a little common sense!

### The Revival of the Handicrafts

THE wide-spread impulse towards revival of the handicrafts has aroused no little interest in the picturesque old-time spinning wheel and in spinning itself. Although this industry has never been wholly discarded in European countries, few indeed are the American women today who know how to spin or weave.

There was a time, not so long gone by, when the spinning wheel was as much a part of every American home as the hearthstone, and perhaps the most attractive picture we retain of early colonial days in America is that of the busy housewife at her spinning wheel, spinning the flax to be later woven into cloth and fashioned into clothing for her family. In those strenuous days every garment was produced in this arduous way by the mothers and daughters of the colonists, and it may be that the constant and imperative necessity for devoting every spare moment to the spinning wheel or loom went far towards keeping those

shore to shore because they had incurred the wrath of the gods. Landing in Egypt, they were received kindly and presented with gifts, among which was a golden spindle given to Helen. One of the modern poets, in relating this instance, gives us this picture of the ancient spindle and distaff:

... many yet adhere  
To the ancient distaff at the bosom fixed,  
Casting the whirling spindle as they walk.  
... This was of old in no inglorious days,  
The mode of spinning, when the Egyptian prince  
A golden distaff gave the beauteous nymph,  
Too beauteous Helen; no uncourtly gift.

No less a deity than glorious Pallas Athena, Goddess of Wisdom, presided over the art. "Fight and weave," she said, "I myself will answer for the course of the lance and the colors of the loom."

Products of modern invention, however, have supplanted the erstwhile loom and spinning wheel and rendered them no longer an essential part of women's lives; but modern methods have not been wholly successful in

# OUR YOUNG FOLK

## Chevalier de Gluck

**C**HRISTOPHER WILLIBALD GLUCK was a famous operatic composer among whose works are the music-dramas *Orphée et Eurydice*, *Alceste*, *Armide*, *Iphigénie en Aulide*, and *Iphigénie en Tauride*.

An opera is a play set to music; that is, the story of the drama instead of being spoken is sung, with dramatic action and amid fitting scenery. The singing includes solos, duets, trios, quartets, etc., supported by a chorus and an orchestra. Some operas owing to their form are called music dramas, and Gluck was the father of the modern German music drama of which Richard Wagner became the greatest exponent. The Italian opera in Gluck's time had become degraded, the text often being of the most frivolous nature, sometimes without any connected meaning. We shall see how it was that Gluck through his noble efforts reformed the opera, placing it on its true dramatic basis and making it an uplifting power for the good of humanity.

The life of this musical reformer is interesting not only because of his valuable services to art but also because of the nobility and simplicity of his character. He was born in Weidenwang, Germany, in 1714, and his parents, who were plain, humble country people gave him a much better education than they had had themselves. His training when a little boy developed sturdy powers of endurance, for he often used to walk through the woods with his father who was a forester in the service of Prince Lobkowitz, barefooted in mid-winter and laden with weighty tools. He was sent to a school where he learned among other things to play the violin, 'cello, organ, and clavier, as well as to sing. Wishing to have further musical and scientific training he went to Prague in 1732, determined to make his own way in the world, for his father's means were too limited to provide entirely for his son's support.

The resolute young lad now taught music for a living and had to endure many hardships, sometimes even being obliged to earn his meals by wandering about from village to village playing dance music to entertain the people. But he always kept before him his ideals for his future work, and obstacles proved but stepping stones to him. He pushed fearlessly onward ever filled with hope and courage, until he reached Vienna where he was given help and protection by his father's employer, the influential Prince Lobkowitz, who was much interested in the talented boy.

By this time Gluck had made wonderful progress in his music and had given successful concerts. He loved best to play the violin and 'cello. In the palace of Lobkowitz he fortunately met the Lombard Prince Melzi who invited him to go to Milan with him to be his chamber musician, and gave him the opportunity of studying for four years with Sammartini who was then one of the greatest music masters in Italy. From this famous teacher Gluck learned how to compose dramatic music and

## MUSIC

**A**MONG all the sciences this is more commendable, courtly, pleasing, mirthful and lovely. It makes a man liberal, courteous, glad, amiable; it exerts him to bear fatigue; it comforts him under labor; it refreshes the troubled mind; it takes away headache and sorrow; and dispels the depraved humours and the desponding spirit. — *Bede*

began to write operas which met with immediate success.

This was indeed a happy time for Gluck, for in addition to the joy which his musical work brought him he found the greatest delight in the beautiful country surrounding him. The lovely Italian landscape with its clear sky, blue waters, and the fragrant gardens about the Prince's home, were a constant source of inspiration to him.

After Gluck had produced many operas in Italy and became famous there he accepted an invitation to go to London to bring out some new works. His compositions at this time were in the then prevailing Italian style, and although pleasing to the popular taste they were really quite commonplace and gave but little promise of the nobility and grandeur of his later works. In London the success of his operas gradually declined and it was here that Gluck began to realize that he had been working along wrong lines. To him failure meant the opportunity to learn lessons for further development.

In those days vocal music was all the fashion in Italy and throughout Europe, and great singers even went so far, in their vanity, as to dictate to composers just how their part should be written so as to show off their own singing. There was no regard for the relation which the music should bear to the words or for the character of the poetry. Music and drama, whose mission it is to educate and uplift the people, were being used merely to please the senses and were degrading the public mind.

Gluck, who had long felt that the opera was on the road to decay now saw that the time had come to change the old order of things; so he began to study with great earnestness not only music but poetry and the literature and languages of various countries. He traveled to many different cities, becoming acquainted with the most cultured minds of Europe so that he might broaden his knowledge and gain a deeper insight into the work before him. He realized that in the true music drama, music and poetry should be united; that the music must follow the rhythm and melody of the words and be but an aid in conveying their message. In the new works which he now produced, his aim was to teach the people noble lessons through the power of the grand harmonies of music combined with a beautiful, lofty text.

These principles were the same as those used by the ancient Greeks in their theaters, and although an attempt had been made in 1600 by Peri and others to attain this ideal, it was Gluck who first succeeded in more fully

realizing it, after which the great Wagner brought it to still further fruition. Gluck believed that the overture to the music drama should prepare the listeners for its character, and he added many new instruments to the orchestra, using it to strengthen and intensify the dramatic expression. He was decidedly original, and created many new forms of operatic expression besides re-modelling old ones.

It is of course not surprising that all these innovations should at first have met with opposition; but the beauty and simplicity of his works were so great that they soon won the hearts of all music lovers and were welcomed with overwhelming enthusiasm.

In 1773 the now famous musician went to France to carry on his work of reform. Here he had many hard battles to fight in overcoming the jealousies, prejudices, and antagonism of his enemies as well as the wrong customs which had so long been in use; but the warrior spirit in Chevalier de Gluck was not to be crushed. He had an indomitable will and strength of purpose, and with the aid of the Queen, Marie Antoinette, who was his dear friend and former pupil, he ultimately gained a glorious victory.

As a man Gluck was self-reliant, dignified, and lofty-minded. He combined happily the temperament of a true artist with that of a practical man of affairs. Although he was jolly and good natured he had a quick temper and was extremely exacting and severe at rehearsals — so much so that sometimes the king himself was obliged to smooth things over with the musicians, saying "Hush, hush! It is only his way."

To young musicians Gluck was always very helpful, and they in turn loved him dearly. Far from being conceited he remained simple and direct. He married in 1750 a highly cultured and beautiful young woman, Marianna Pergin, who appreciated his genius and was a true companion to him.

Gluck did not die in poverty as has been the case with so many great men; on the contrary he amassed quite a fortune, and men of the highest rank vied with each other in paying him homage. Goethe, Schiller, and even Voltaire expressed their admiration of his genius, and Händel, Rameau, and many famous musicians were his friends. The Empress Marie Theresa appointed him her court composer, which position he held for ten years. At Rome he was made a "Chevalier of the Golden Spur," and since then he has always been known as the Chevalier de Gluck. He died when seventy-three years of age.

The good influence of Gluck's work will live for all time, for he lifted the opera from a stage of degradation and established it as a factor for good. He never used his art for personal gain or popularity, but always remained true to his high ideals. His endeavor was to attain a grand simplicity; how well he succeeded the pure, poetic beauty of his master works show.

## A SUNSHINY AFTERNOON IN THE GARDENS IN LOMALAND

### The Winged Rock

OUT on the Arizona desert, not a great way from the Grand Cañon, stands a large white rock which resembles a ship in form. The Navajo Indians tell this legend concerning it.

Many centuries ago when the sun shone brighter than it does today, there came across the straits, far, far in the North of this great country, a tribe of people from the eastern continent.

The people of the northern country were ill pleased with these intruders and made war with them at once. As there were many more natives, the new comers fared badly and would all have been killed but for the assistance of Those Above to whom they prayed for protection from their enemies. Their prayers were answered by a messenger who, pointing to a large white rock, directed them to climb upon it, and told them that it would carry them south to a land of sunshine, not far from the western sea, where they could live in peace. So the people ran to the rock and climbed upon it and when they were all gathered safely upon it, the rock arose slowly into the air and gently floated down the coast.

### HUMILITY

James Montgomery

THE bird that soars on highest wing  
Builds on the ground her lowly nest;  
And she that doth most sweetly sing  
Sings in the shade when all things rest  
—In lark and nightingale we see  
What honor hath humility.

Many were the wondrous sights they saw as they sailed over lake, river and mountain. The days and nights passed, but still they floated onward; many a fair land they passed over in which they wished to make their home, but the rock sailed steadily on. Over the Grand Cañon of the Colorado they sailed and the people gazed in awe into the stupendous chasm and were afraid; but the great white ship rock bore them safely over it and gently settled itself in the desert land a little beyond. Then they knew that this desert land was to be their home, and although it seemed but a desolate place at first they were soon content; for Those Above sent a messenger to teach them where to find water, how to pray to the gods to bring the rain, how to raise their crops and how to gather and prepare food from the wild plants; so that they soon grew very wise

in Nature's secrets and learned to love their desert country.

The great winged rock is sacred to them, and carefully guarded from all intrusion, for they believe that the sun ever watches their actions and reports to Those Above, and that if they always do right, some day they will be summoned by a messenger from Those Above as before, and will sail away on the winged rock into a land of plenty. EUGENIA

### The Singer of the Night

THE nightingale is a shy, sober-coated little bird that loves to hide away in the leafy depths of the woods. There he sings joyously. The notes pour out clear and golden from his tiny gray throat. It is hard to believe that such a small bird can make such full rich music. His song is often heard at night. When a person has once heard a nightingale sing at night, he never forgets it. He holds it as one of the sweetest memories of his life. Sometimes the poets call it by its beautiful Greek name, philomel; sometimes by one of its Oriental names, bulbul; for the people of the East as well as the West love the sweet night songster. AVIS

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.

Of "Metaphysical Healing"  
Affirmations and Denials  
The Cure of Diseases

Replanting Diseases for Future Use

—by **William Q. Judge**

**A MOST VALUABLE PAMPHLET.** Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its *rationale*, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

## The British Association Meeting

THE recent meeting in Dublin of the British Association for the Advancement of Science was chiefly remarkable for the opening address by President Darwin, who now finds in the movements of plants "the dim beginnings of habit or unconscious memory." The prevailing impression produced seems to be that science is now invading the region of "psychology." To be successful, however, such an invasion would require a greater knowledge of the domains covered by the word "psychology" than the above contradiction in terms would indicate. Action rooted in memory must be conscious; but both the kind of memory and that of consciousness, may be widely different, in stone, plant, and animal, from anything normally within the threshold of human waking consciousness. Of the infinite stairways of consciousness it may be said with perfect fairness the science of the day knows as little as do the official expounders of some of the world's sacred writings.

If this be regarded as too strong a statement, the answer is that science, having hitherto relegated consciousness to the backyard, can not reasonably be expected to know much about it, all of a sudden! And as to the religionists, and others, the ignorance of the subject on the part of multitudes is surely evinced by the ease with which "psychics," "spiritists," hypnotists, "clairvoyants," and so on, have undermined their judgment and balance, while they remain unaware of the involved terrible dangers to the human subject—and operator.

In the geological section Professor Joly alluded to a conclusion arrived at by Strutt—that the radium distributed through the rock materials of the earth's surface greatly exceeded any permissible estimate of its internal radio-activity, and he said this had not yet received any explanation. He suggested that the concentration of the heaviest known element, uranium, at the surface of the earth, might be due to the heat-producing capacity of that substance.

If it was originally scattered through the earth-stuff, not in a uniform distribution, but to some extent concentrated fortuitously in a manner depending on the origin of terrestrial ingredients, then these radio-active nuclei, heating and expanding beyond the capacity of surrounding materials would rise to the surface of a world in which convective actions were still possible, and, very conceivably, even after such conditions had ceased to be general; and in this way the surface materials would become richer than the interior.

This is a fair example of what is known as

scientific generalization, when the elements of the problem are mostly unknown. If Professor Darwin has made a bold advance into the "psychology" of plant-life, doubtless it is too soon for Geology to advance into the psychology of world-life, so we must be content to listen still to the echoes of that materialism which regards an evolving planet as a bundle of matter concentrated fortuitously in a manner depending on the origin of—what is fortuitously concentrated!

Strutt's conclusions, however, may yet be found to lead to an important line of thought in another direction. For if the earth would be too hot on the assumption of the same percentage of radio-active elements throughout its whole cubic capacity, is not the plain inference rather that the interior may be composed of matter in states unknown to Geology? And are there not already in evidence pendulum and other experiments pointing to some change in the nature of the interior at the very moderate depth of forty or fifty miles? Professor Joly went on to speak of the influence of radium in the dynamics of the earth's crust, saying that it afforded a key to the instability of the crust, owing to it being carried by denudation from mountains to sea and so on. But it may yet be found that there are other potent influences governing the rises and submergences of continents. Besides, *what is the key to radium?*

In the zoology section allusion was made to an interesting theory lately developed to the effect that the decay of the ancient civilizations of Greece and Rome was largely due to the introduction of malaria into those countries! It is certainly true for a psychological advance in the realm of zoology, when such inversions of cause and effect can be put forward seriously. The diseases that invade man and affect the lower kingdoms around him, are of man's own creation, and result from poisoned and impure life; pestilential surroundings simply reflect a diseased and enfeebled national spirit. But this is a proposition belonging to the open-eyed science of Theosophy.

In the geography section the president stated there was now but little of the earth's surface absolutely unknown. In view of the fact that Sven Hedin has just discovered a mountain range two thousand miles long hitherto quite unknown to the West, the statement needs modification, as no reference seems to have been made to his discoveries.

In the sub-section on agriculture the problems of rural life formed the subject of an

admirable address by Sir Horace Plunkett. Regarding "nature-study" he said:

**More Sympathy  
With Nature  
Needed**

To make those processes interesting to the child you must first make them interesting to the teacher. . . . Somehow or other that intimacy with and affection for nature, to which Wordsworth has given the highest expression, must be engendered in the mind of the rural youth.

In dealing with agricultural education Dr. Dunham, of Harvard, quoted the opinion of a German scientist that of all the wasters of man's inheritance on this earth the very worst were the American people. Neither their soil, wood, coal, nor iron could continue to meet the demands that were made upon them. If they were sufficiently well trained in agriculture to till their land as well as in France, they would be able to feed five times their present population.

In the engineering section a notable truth was uttered by Sir William White, the brilliant naval constructor, when he declared that Rankine was the connecting link between the scientific and the practical world.

F. J. DICK, M. INST. C. E.

### "Unconscious Vocalization and Audition"

SOME scientists have been trying this experiment: one person has a bag containing a large number of balls of six different kinds indicated by numbers. He draws balls one by one casually, looks at their numbers, and the other person guesses the numbers. Under these circumstances it was found that the number of correct guesses was *always* in excess of that required by the law of probabilities. Hence the fact that the drawer knew the numbers must have been a determining factor in the result; that is, telepathy.

To avoid this inevitable conclusion, the theory has been advanced that one man "unconsciously vocalizes" and the other exercises "unconscious audition"! Would you rather be superstitious or skeptical? If it makes you feel bad to think of telepathy, it may console you to know that after all it is only *subconscious* automatic vocalization and *subliminal* audition, and the mystery vanishes under the cold glare of the scientific eye. What an age we live in!

But seriously, when a man *guesses* a number, whence does his choice come? What decides him? It seems as if the scientists ought to have settled this point first. But the fact is that they simply *do not know* what are the causes which determine those choices which they call "casual." Yet such causes must of course exist—unless there can be effects without causes! Now there are laws which regulate so-called "casual" actions, and these laws are susceptible of being understood and organized into a science. But it is a part of the sciences not yet rediscovered in our age. In antiquity this very process of drawing balls, or lots, was used as a way of finding out certain things; but we can't work it—hence it never did work!

Naturally the presence of a thought-form in an adjacent mind would predispose the guesser to select that particular thought-form. But if scientists once universally admitted telepathy, they would have to admit a great deal

more than they find it convenient to admit.

When we come to explanation, the customary modes in which thought is transmitted are just as inexplicable as telepathy; for the bridge that connects mind with mind begins at one end with a throat and ends at the other with an ear, while between the mind of the speaker and his voice, and between the ear of the listener and his mind, there are unbridged gaps. If my mind can set my larynx in motion, why might it not set your brain in motion? But there is a natural desire to restrict the possibilities of Nature within familiar bounds.

One remarkable result of an extensive series of such experiments conducted in France was that greater successes were made by the guesser when the probability was one-sixth rather than one-fourth, one-eighth, one-twelfth, etc.

### "Ere Yet My Body Born"

SOUL AND BODY

Where wert thou Soul, ere yet my body born  
Became thy dwelling place? Didst thou on earth,  
Or in the clouds, await this body's birth?  
Or by what chance upon that winter's morn  
Didst thou this body find, a babe forlorn?  
Didst thou in sorrow enter or in mirth?  
Or for a jest, perchance, to try its worth  
Thou tookest flesh, ne'er from it to be torn?  
Nay, Soul, I will not mock thee; well I know  
Thou wert not on the earth, nor in the sky;  
For with my body's growth thou too didst grow;  
But with that body's death wilt thou too die?  
I know not, and thou canst not tell me, so  
In doubt we'll go together—thou and I.

Samuel Waddington

THE above piece will be found quoted, along with other similar ones, in Theosophical writings on Reincarnation, as an instance of the efforts made by the human intuition to express its convictions rationally in the terms of conventional thought. The fact of Reincarnation is an item of ancient knowledge, always known to humanity during periods of enlightenment, but largely lost during cycles of darkness. During the latter periods, however, it frequently crops up in forms more or less vague or definite; but finds no dwelling-place in the current philosophy and so remains a mere yearning ending in a frankly confessed doubt, as above.

The great question, put briefly, is: *How much of this consciousness which I call "myself" is permanent beyond death?* This is evidently not a simple question to be answered offhand; it involves the whole science of the human constitution. We cannot say that we are either mortal or immortal; neither would be true. It is necessary to know what is that self of which we are speaking. As this self is complex, part of it is mortal and part immortal.

The reason that ordinary people are not conscious of having lived before is that the bulk of their self-consciousness is of the mortal kind and that they have not developed the immortal part. We may cling tenaciously to our personality, but that by no means proves that it ought to be perpetuated, or even that we should be glad to have it perpetuated. We often cling to things which we are afterwards very glad to have given up, once the preliminary wrench has been made. Even so, death frees us from bonds which we are not strong enough to break of our own will, but which we are *glad to be rid of*. The permanent part of our nature is not the personal self as

we know it now; there is an essential impermanency in our ordinary consciousness; it is made up of a succession of states which always come to an end, pleasures which cloy, desires which are *never* attained. Permanent satisfaction is not to be found in it.

But it is by no means to be imagined that man need always be so. In a higher state of evolution he may be strong enough to burst the bounds of his personality of his own will and without the aid of death, thus achieving immortality and a consciousness which bridges the grave. The poet laments his ignorance, but we should not rest content with ignorance as an ideal but look forward to the attainment of knowledge.

STUDENT

### Jesus an Aryan

SOME excitement was caused at the recent Copenhagen Congress of Orientalists by the contention of Professor Haupt (of the Johns Hopkins University) that Jesus was an Aryan and not a Semite. According to him, there was a strong influx of Aryan settlers into Galilee in the Seventh century B. C., and from this stock came Jesus.

According to Theosophy, the Semites *are* Aryans. In *The Secret Doctrine* vol. II, p. 200, H. P. Blavatsky says:

The Semites, especially the Arabs, are later Aryans. . . . To these belong all the Jews and the Arabs. The former are a tribe descended from the Chandālas of India . . . who sought refuge in Chaldaea, in Scinde, and Aria (Iran) . . . some 8000 years B. C. The latter, the Arabs, are the descendants of those Aryans who would not go into India at the time of the dispersal of nations, some of whom remained on the borderlands thereof, in Afghānistān and Kabul, and along the Oxus, while others penetrated into and invaded Arabia.

STUDENT

### The Dangers of Sea Fogs

ALTHOUGH only three or four years have elapsed since submarine bell-signalling was practically introduced, more than one hundred of the principal steamships of the world now carry the receiving apparatus by means of which it is possible to ascertain the position of lightships or stations at which submarine bells have been fitted, from ships moving at full speed, and at distances of six miles or more. Thus the *Kaiser Wilhelm II* in a thick fog heard the submarine bell signal of the Weser lightship with the starboard receiver when ten miles from it, and therefore changed course one point to the starboard, picking up the signal with the port receiver. So the direction of the signal bell can be practically dealt with, and danger averted. Yet the practice of keeping full speed in thick fogs indulged in by some mail steamers seems hardly safe when icebergs are appearing and disappearing in the fog; nature having failed to provide these frozen islands with any form of signalling apparatus other than that of temperature, the radius of which is too short to indicate individual bergs, although the general temperature indicates their presence. The danger in fogs, however, is even greater when near the entrance of an important harbor, where steamers' paths cross one another. Then the only safe way is for all progress to cease, for the direction of a sound does not indicate the course pursued by a vessel, nor its exact distance and speed. These dangers are minimized when definite rules are followed by all.

J.

# Some Views on XXth Century Problems

## Thinking of Nothing

A POPULAR contemporary quotes the advice of a doctor to a patient on the matter of worry.

He who would conquer the worry fiend must tackle him early in the morning. In other words, make a firm stand against worrying thoughts at the very commencement of the day, and you will find that the fight becomes immensely easier later on. To my patients who are dogged with care I always say, "On rising make your mind a blank. If you wake before rising time, do not permit yourself to think. As you dress, have breakfast, go down to the office, steadily put all thoughts away from you. When the real business of the day begins, you will have acquired a reserve of power that will surprise you."

Hard, perhaps, at first, the effort becomes increasingly easier with practice. The small mechanical duties at the beginning of each day require next to no thinking. Make your mind empty during that period.

The advice is in the right direction, but it is just half of what it should be. The mind cannot be made empty; it must reflect the outer or the inner. The outer is the personal life, memories and anticipations connected with that, and immediate surroundings. Mind ordinarily reflects this, combines and recombines the parts and items of the picture, and reasons. Each picture or item, dwelt on for time enough, induces a mood; and conversely, any mood will tend to call up pictures, memories, anticipations, that tend to strengthen it.

It is possible, by practice, as the doctor says, to interfere with this. If each thought or picture, as soon as it presents, is discharged *and nothing substituted*; if the mind is not permitted to continue with anything, its ultimate injury would be pretty certain. It would become *incapable* of dwelling upon anything, and when wanted for real work would give under the least pressure. Any mental practice that does not rest on the essential facts of human nature must bring trouble.

The essential fact of human nature is that self is soul, a light born from the one Light of the world. But, absorbed into the mind, whirling in the mind's incessant dance, it has lost recognition of itself.

Now this very practice recommended, of hindering the dance, implies the hinderer, the self, *potentially* the dominator of the mind. The practice will be beneficial, helpful towards self-recognition, if the mind is held facing inward to self, only allowed to turn outward sufficiently for the proper doing of the mechanical duties of the early morning. A little of the practice will enable the mind to be as it were *seen* straining at its chain, darting in every direction. But now the *man* feels himself as chain-holder and makes the mind take that as a thought. So the mind has now something real to occupy itself with. But that is not enough; it must have more material than that. More and more fully must mind be made to picture the self as what that self is. Self is more than chain-holder; it is, again, a *light* as are all selves, its brethren, born of one great Light. It is eternal. Its essential unselfishness, its essential compassion, love, divinity, its proper joy, its own

light, its freedom — from all these it is only kept away by mind, by having permitted mind to dominate it. And now it is beginning to dominate, is beginning to come back to these things. *Give these things to the mind to think of and realize.* That is the rest of the doctor's prescription. Each step of realization is a step of the self's path back to its soulhood, and all of them must be taken. STUDENT

## Superfluous Colleges

THE case of the theological colleges seems rather hopeless. A medical college, a musical, an engineering, teach things specific to themselves, hardly touched or touchable by any other. But the subject matter of the theology courses could be quite easily distributed around, to some extent does exist in this distribution. Archaeology, history, ancient languages and literatures, philosophy, and comparative religion, practically include the whole theological course among their matter.

That is why the theological colleges are lacking students in greater and greater degree. It is at any rate one reason. The more intelligent young men prefer to take their philosophy, ancient languages and so on, direct.

No theological college has yet ventured to say that it trains students, the consciousness of students to come to *immediate* knowledge of the nature of God. That is mysticism, and mysticism is that, surely; and no theological college claims to make mystics.

The student of that must be his own college; no one else can take him in hand and cure him. For the first step to theology, may be all the steps, are as it were medical. A man who proposes to compete in athletics must first get his heart strong, if it was weak; his digestion strong, if that was weak. A would-be violin student whose ear is inaccurate must take preliminary exercises in correct tone making. For any great bodily effort the body must be cleared of the effects of previous years of ill living.

Is it any other with the great effort of consciousness, the knowing of God, which the theological student must have set before himself? Must not consciousness be healed and cleansed? Can it at once turn to this high task if for years it has permitted sensual pictures and impulses to grow unchecked? If its first thought on waking in the morning is of eating; if its control of the body is so weak that the man can hardly get out of bed; if its fixed and habitual pictures of friends are of their faults; if it is jealous, irritable, ungenerous, ambitious, selfish, and has been so since life began; if it cannot hold itself upon a thought for two minutes?

Such a consciousness is, in the proportion of any of these failings, diseased, dirty, inadequate, warped and strained. And it must therefore be healed, cleaned, steadied, straightened and strengthened. All this is not to be done in a moment, nor by a few minute's effort a day; yet it is the preliminary to a real study of theology. Obviously, the divine nature cannot be reflected in, known by, a

consciousness that is diseased, warped, or dirty.

So the real theological college is the atmosphere of the man's will; he is both professor and student; seeking the kingdom of heaven within him, he becomes his own teacher and physician. Of old, perhaps, there were colleges, temples where were teachers wise enough to see the inner natures of the students and help them by counsel in their progress and self-clarification. But are there any now?

STUDENT

## The General Fall

THE German birthrate, it appears, is also falling, notwithstanding increase in population. The increase is due to falling *deathrate*, and this, mainly, to the better hygienic treatment of children. Forty years ago the deaths were about 30 per thousand; now they are 20. But forty years ago the births were about 40 per thousand; now they are under 34.

Germany is thus in line with nearly all the other Western countries, including America.

Professor Sombart, who gives the figures, suggests no remedy. But in the other countries there *are* proposers of remedies, the remedies depending upon hypothesized causes.

History easily shows that in the process of decay nations do lose population and may thus become extinct. Here, however, probably in every case, a very high deathrate concurs with an increasingly low birthrate.

The Western Aryan nations hardly suppose themselves to be in this class. Nor, if they do, can they suppose that any of the proposed remedies would help the matter.

Is not the phenomenon made too much of? We know that everything in nature goes by cycles, great or small. Is it not likely that the birthrate slowly oscillates on either side of a mean, and that the oscillations may require a century or more? We have not the necessary figures to compare the present birthrates with those of even one century ago. There may be such figures for small districts or classes; but small districts or classes might be selected now to prove a contention which larger areas would disprove.

There may also be oscillations, for which again there are no data, between East and West, one and the other alternately gaining.

Theosophy teaches that there *are* oscillations of several kinds; that the total number of souls concerned in terrestrial life is fixed; and that when there is a persistent fall in one quarter there must ultimately be an equivalent rise in some other or others. The distribution is according to a law, Karma, which is eternally at work for human progress.

As to the falling deathrate, we are perhaps nearly within sight of the end of this. We shall learn some of the more superficial laws of health, ward off some obvious enemies — and then find that the deathrate persists and rises. For its profounder causes, thus isolated, lie in regions of conduct and feeling which the average individual does not intend to clean up, hardly knows he ought. STUDENT

# Archaeology Palaeontology Ethnology

## An Antarctic Continent

SOME two or three hundred miles south of New Zealand lie a number of rocky islands known as the Snares, Disappointment, Auckland and Campbell Islands. An expedition recently sent to them from New Zealand is reported to have expressed the following views about them.

These islands were once part of the continent of *Antarctica*. Although their distance from continental land would lead one to suppose they were oceanic islands, their formation is that of continental islands. Instead of being built up from the bottom by volcanic outflow or coral, like other oceanic islands, they contain continental rocks, such as sandstone and other sedimentary formations. Many of these rocks bear the marks of former glaciation, such as grooves and moraine heaps. Yet the islands are over 1000 miles from Australia, and about 1200 from Victoria Land.

The expedition believes, that at a geological age not very far distant, the Antarctic continent extended from Australia to the South Pole and South America, and that later a large part of it sank beneath the sea.

Readers will recognize this as part of the conjectured continent called by Sclater *Lemuria*, a name adopted by H. P. Blavatsky for the actual ancient continent which existed in the Pacific and was the home of the Third Root-Race of Humanity. The evidence for the former existence of such a continent is indisputable. Take the following, which is quoted in *The Secret Doctrine* from *Histoire des Vierges: Les Peuples et Continents Disparus*:

One of the most ancient legends of India, preserved in the temples by oral and written tradition, relates that several hundred thousand years ago there existed in the Pacific Ocean an immense continent which was destroyed by geological upheaval, and the fragments of which must be sought in Madagascar, Ceylon, Sumatra, Java, Borneo, and the principal isles of Polynesia.

The high plateaux of Hindustân and Asia, according to this hypothesis, would only have been represented in those distant epochs by great islands contiguous to the central continent. According to the Brâhmins, this country had attained a high civilization, and the peninsula of Hindustân . . . has but continued the chain of the primitive traditions born in this place. . . .

As to the Polynesian continent which disappeared at the time of the final geological cataclysms, its existence rests on such proofs that to be logical we can doubt no longer. The three summits of this continent, the Sandwich Islands, New Zealand, Easter Island, are distant from each other fifteen to eighteen hundred leagues, and the groups of intermediate islands . . . are themselves distant from these extreme points from seven or eight hundred to one thousand leagues.

All navigators agree in saying that the extreme and the central groups could never have communi-

cated, in view of their actual geographical position and with the insufficient means they had at hand. . . .

The aborigines of the Sandwich Islands, of Viti, of New Zealand, of the central groups, of Samoa, Tahiti, etc., had never known each other, had never heard of each other, before the arrival of the Europeans.

And yet each of these people maintained that their island had at one time formed part of an immense stretch of land which extended towards the West on the side of Asia. And all, brought together, were found to speak the same language, to have the same usages, the same customs, the same religious belief.

The present or Fifth Race of humanity is about 1,000,000 years old; the Fourth Race, which preceded it, occupied land to which the name *Atlantis* has been given; the Third, *Lemuria*. *Lemuria* flourished and ended her career some 700,000 years before the early Eocene Age. It passed on some of its knowledge to those outlying lands to the north now forming part of Asia; hence the ancient culture of Hindustân and adjacent parts. The degenerate remnants are to be seen in the Australasian aborigines.

Science is struggling between a desire to admit the existence of these early continents and races, on the strength of the overwhelming evidence, and the reluctance to accept a theory which must enlarge conceptions to a degree often found inconvenient. For before we can accept these teachings about the past of humanity we must enlarge our views of life in many directions, as these teachings will not accord with any narrow dogmatism we may be anxious to retain.

## High Culture of "Shepherd Kings"

AN archaeological note states that Professor Garstang has returned from Upper Egypt, where he has been excavating at Abydos. Among many exquisite examples of pottery and carving he found a small ivory sphinx holding in its clutches the figure of a man which it is about to devour. This find is considered of great historical value as being "an emblem foreign to Egyptian civilization proper, and of a very early date." But the chief discovery was in a tomb of the Hyksos period, which yielded several beautiful specimens of pottery, smooth, black, thin as porcelain and capable of being polished to mirror-like brightness. It is quite foreign to Egyptian workmanship and resembles specimens found in Asia Minor by the same explorer, who regards it as a link in the chain of evidence he is collecting to identify the Hyksos with the Biblical Hittites.

As has frequently been urged in these pages, the enormous periods of Egyptian history embrace many successive ebbs and flows of civilization and many foreign influxes. But wherever we look, we seem always to find the same evidences of skill and culture; even, as now, among these "Shepherd Kings." "Hittite" is a very vague term, about as definite as the term "European" in the mouth of a Chinaman. The complexity of racial history is far too great to allow one to argue either for or against the Professor's theory, which is probably as true in a general sense as it is inaccurate in a detailed sense.

# ✻ The Trend of Twentieth Century Science ✻

## Our Vesture of Light

THE astronomer, looking at the stars through his telescope, has unfortunately to look through our own atmosphere. Does the spectroscopist face a similar difficulty? According to recent research, the whole of the earth's crust is charged with radium, and contains also many other radio-active elements. It is even a question whether all elements are not radio-active. The amount of radium is considered to be enough to generate the heat of the crust.

Radium (and presumably the other radio-active elements) emits three sets of "rays." One of these is actual light, though beyond the visible spectrum. The earth therefore shines, if, to such eyes as ours, invisibly, by her own light as well as by that which she reflects. She is radiant.

The rays which come from other celestial bodies and which are received and studied by the spectroscopists, have therefore to run the gauntlet of the rays meeting them from the earth itself. Are they, can they be, after this, exactly as they were before? Can they give us true data of the composition of the bodies from whence they come? May they not even give us back merely or in part data of the composition of our own celestial home?

The point is raised by H. P. Blavatsky, who remarks:

*"The essence of cometary matter and of that which composes the stars is totally different from any of the chemical or physical characteristics with which Western Science is now acquainted. While the spectroscope has shown the probable similarity (owing to the chemical action of terrestrial light upon the intercepted rays) of earthly and sidereal substance, the chemical actions peculiar to the variously progressed orbs of space, have not been detected, nor proven to be identical with those observed on our own planet." (The Secret Doctrine, vol. I, p. 597.)*

## Old and New Physiology

FURTHER and further study of digestion and assimilation takes us further and further away from the simple conceptions that obtained up to a very few years ago. Especially is this true of nitrogenous matters, proteins. Up till recently we learned that they passed through one or two superficial changes, becoming peptone; and so went on to the liver and blood. When delivered to the cells, these little changes were quite simply reversed so as to restore the protein condition. The restored protein was immediately ready to become the cell protoplasm, protoplasm being living protein.

This was in the days when pepsin was considered to be about the only ferment concerned in the matter. Since then a number of other ferments have been discovered in all the digestive juices from the stomach downward, all of them with their roles of action. The list is increasing yet, and the more that is known about them the more essentially mysterious is their power.

But when they have all done their work the peptone molecules have vanished in little pieces

as it were. The process is almost as complete as the levelling of one house to build with the bricks another, much more complete than the picking apart of one garment to make another with it. The peptone molecule is reduced nearly to its radical units, crystalline acids and so on. It seems probable that it is wholly reduced to simple crystallizable groups and thus delivered to the cell as it were in small packets. From these the cell selects what it wants and rebuilds from the root up, rejecting the rest. It does the rebuilding by means of ferments of its own making, acting reversely to those which in digestion did the unbuilding. The unwanted groups finally appear as urea and uric acid.

From all this new knowledge, new ideas about diet have naturally resulted. The steady output of urea was till now regarded as the measure of the amount of nitrogenous food necessary. It is now regarded as very nearly the measure of the amount of nitrogenous food which has been taken *in excess of requirement*. The amount of this sort of food really needed is measured by the actual wear and tear of the cell. And this is very little indeed. The excess of nitrogen which we habitually consume acts as an irritant. It is indeed suggested that the wear and tear is simply the production of the ferments, the replacement of such of them as are worn out, if they do wear out; and of such of them as have been carried away in solution in the blood stream.

It is evident, therefore, that the question of diet is still wide open, and that tables in the books have only the right to be entirely neglected.

## The Thoughtful Orchid

THE well known naturalist, Mr. John Ward, writing in a contemporary upon the spotted wild orchid, points out that the doctrine of soil exhaustion (old theory) or soil poisoning (new theory), is evidently practically known to his favorite plant. It has working arrangements for moving through the soil to fresh quarters.

Each year the flowering stalk is sent up into the sunlight from an underground tuber. As the season goes on this tuber develops another one alongside of itself. Into that other it ultimately transfers its life and juices, itself then atrophying. When the new season comes, the new flowering stalk comes up from the new tuber. This in its turn repeats the process and thus the plant gently travels sideways from year to year, passing from soil which it has exhausted or poisoned, into fresh ground.

The method of *deepening* the tuber is equally ingenious. It is from the top of it that the rootlets spring, arching round it and then striking deep. When they have attained a deep anchorage they begin a gentle pull, gentle but strong enough to sink the tuber as far as desirable.

To protect its leaves from being eaten by the cows along with the grass, this little plant has caused some of them to resemble vipers!

Many are the half hours [says Mr. Ward] in which I have puzzled over those leaves. Striking and mysterious are they in the extreme. They are smooth, glossy, deep olive green, and spotted with stripes and dots of a dark brown pigment; and it is these curious brown markings that make them so mysterious.

Time and again, he says, they suggested something to him, but what they suggested he could not for the life of him recall. But one day, seeing one of these leaves projecting, he put out his hand to clear away the surrounding grass. The "leaf" scuttled away into the hedge, was in fact an adder.

The exposed part of the olive body of that viper, striped and spotted with dark markings, as it appeared amongst the grass, was almost identical with the appearance of the leaves of the orchid when similarly placed; indeed, the very curves that the leaves assumed as they poked amongst the blades of grass presented an astonishing resemblance.

From that he passes to the complicated little bit of apparatus in the flower by which the plant prevents self-fertilization; and then finishes:

Perhaps I have said enough to make the thoughtful reader reflect that plants are not quite the insentient organisms that we sometimes consider them to be. There is purpose in even the minutest detail of their complex structure; their intelligence may be unconscious, but it is none the less real.

The intelligence at work in these ways may be *outside the consciousness of the plant* and yet not be unconscious. The *individual plant's* intelligence is probably no more than is enough to enable it to deal with the events of its individual life, specially nutrient spots in the earth to be found by the roots, special turns and twists to be made by the leaves so as to get all the light they need, and so on. Those special conformations that mark a *whole species* and are designed adaptations to surroundings, must be the work of a much larger intelligence common to the species, one that tries experiments, notes when they fail, and then tries others. In this intelligent experimentation would be the chief cause of the varieties upon which natural selection then works.

## Earthquake Paths

DR. MILNE'S address to the British Association concerning earthquakes dwelt on one curious fact for which he had no explanation. He had particularly studied 79 large disturbances arising south of the Caucasus, north of India, and in the east or south of Japan. All of these had made more headway to the west than to the east; and few of them had got across the Equator with sufficient force to register themselves on the seismographs of observatories in the Southern Hemisphere.

The fact must stand for itself till we have more to add to it. Seismographists are not yet working together closely enough, nor are there yet enough of them, to plot out a possible pattern on the crust corresponding with lines of readiest transmission. We may ultimately understand the lines of Mars. C.

**"Instinct" in Animals**

**T**HE steamer *City of Kingston*, says a Seattle paper, has a cat which has long been attached to it, and which could never be induced, even by the most persuasive coaxing, to leave it. The cat had never been known to miss a trip. But when the *Kingston* arrived in Seattle recently from Victoria, the cat went ashore; and when the time came to make the voyage which proved so disastrous to the ship, the animal refused to be coaxed aboard. Having been carried aboard, it managed to spring ashore just as the lines were being hauled in, and thus saved its life. This is called "marvelous instinct."

Such instances are by no means rare, though the more dramatic ones claim most attention. In face of such inexplicable facts, dogmatists should be humble; and never should anyone who values logic and common sense put forward the lack of an explanation as a proof that a thing could not have happened. The world has not quite been reduced to a cut-and-dried formula yet. How does science explain this? One would like to know.

What causes accidents? Chance or the hand of God, we say. Could the cat have scented Chance or the hand of God aboard that ship? Clearly it scented something that was there aboard the ship, something malign. And as we do not know what it is that determines the so-called casual happenings of life, one is free to suggest that in this case the cause was that influence which the cat scented. Of what nature was this mysterious entity? Was one of the passengers a Jonah, carrying about with him the stored-up force of evil thoughts ready to seek a vent? Was the ship carrying invisible freight of the kind against which some peoples use charms and incantations, others prayers, and still others antiseptics?

None of the crew or passengers seem to have felt this influence; or, if they did, to have heeded it. Reason is a superior faculty in the general run; but on occasions it gets in the way and man has to bow before the humble animal. Yet man has all the faculties that animals have, only some of them are out of fettle and some are overlaid with an incrustation of ideas.

As science can predict many things by its knowledge of the causal machinery that links things together, so there is a vast amount of causal machinery which science does not know and cannot trace, yet which is most potent in bringing things to pass. Any mind, be it that of cat or man, able to sense a link in this unknown chain of causes would seem to be gift-

ed with prophetic ability. What does science know of the thought-world, its space, its matter, its electricity? Theosophy knows a great deal, and Theosophists probably have knowledge in proportion to their deserts and to their ability to profit wisely by it. But is not the road to knowledge largely a return to the obvious and a relinquishing of our roundabout ways of thinking?

**Forestry in Prussia**

**T**HE Prussian forests, covering nearly seven million acres, are made up much as if we should combine the pineries of the Southern States with the forests of some of our Middle Atlantic and Central States. When forestry was begun a great part of them had been injured by mismanagement, as our forests have been, and the Prussian foresters had to solve the problem of improving the run-down forests out of the return from those which were still in good condition. They solved it with striking success. Immense improvement has already taken place and is going steadily on. The method of management adopted calls for a sustained yield—that is, no more wood is cut than the forest produces. Under this management the growth of the forest, and consequently the amount cut, has risen sharply. In 1830 the yield was 20 cubic feet per acre; in 1865, 24 cubic feet; in 1890,

54 cubic feet, and in 1904, 65 cubic feet. In other words, Prussian forest management has multiplied the rate of production threefold in seventy-five years. And the quality of the product has improved with the quantity. Between 1830 and 1904 the percentage of sawn timber rose from 19 to 54.

J.

**The Shore Birds**

**H**OW graceful is the shore bird! How exquisitely he scampers along the beach, picking up bits of food. Now he dashes down over the freshly wet sand; now he jumps back with the ebb and flow of the waves. What a sure sense he has of the little brothers of his flock! It is time now to be off; they are off together with a jump. And the plaintive call of the storm-belated one, in search of some of his kind—can anyone fail to respond in his heart?

Along the shores of Point Loma, the perfect trust of these creatures in the presence of man is very noticeable, in comparison with the furtive behavior of their kind on the Atlantic. In the East where society is more stilted, men of affairs must rush to the gun, as an inevitable reaction from the dingy office. Is it true that the people of the Golden State have started out upon a life more in harmony with Nature?—that they have a more genuine relation with animals?

### Below the Surface

INDEED there is an "outer" and an "inner" aspect to all things, it is a fact that brooks no denial; but how little—generally speaking—is it regarded, and how much is taken, as people say, at "the surface valuation." Theosophically speaking, the surface is always the reflection of something below, something hidden, and it is this *hidden* thing that counts for weal or woe. In the words of a great Teacher, "It is not what is done, but the spirit in which the least thing is done that is counted"; to which we might correlate the familiar teaching, "... and have not charity," in relation to *outer* semblance of virtues.

The man who judges from the outside runs a continual risk of severe shocks in his relation to fellow men, in unexpected incidents; while he who studies the depths of his own nature stands in a more prepared attitude for the "unexpected" whenever it may happen. As a matter of fact, all lives are lived "below the surface"; we live in the world of thought and feeling, and the outer acts are the outcome—we say—or the growth, of these hidden causes. Seeds of thought and feeling are the germs of all outer conditions, both of character, appearance, and condition in life.

If you have not known Theosophy perhaps the idea makes you wonder how it is possible; but assimilate the idea that nothing can exist without a cause, that we are momentarily at work setting effects in motion, that this action of ours preceded our present birth—our present character, with the motives, thoughts, and feelings that go towards making up that entity which we call "I," being the growth of ages of evolution—and it becomes a simple matter to understand, and shows us a clear path to follow both now and for the future.

What then are we? Why are you still in doubt? Let then, Theosophy shed its enlightening rays upon your *mind*, for *you* know, the *real* man knows all the time, though now, as a human soul, you see only "through a glass darkly," while that instrument of perception upon the outer rungs of being leans towards the "seeming" surface and away from the inner *truth*. The truth about ourselves as taught in Theosophy is this: We are Rays of the eternal spiritual Soul of the World; exiles from Home; gaining a needed experience in our work of refining the thoughts and feelings of that product of a lower evolution—in the sense of younger or less progressed—of which we find ourselves to be the informing entity. By aspiration towards the purer realms from which we come, carried to practical issue by noble *deeds* and pure thoughts, we again make it possible to realize in the central depths of our being our Spiritual Oneness with all Life. So, little by little, through paying attention to that which lies *below the sur-*

*face* in our own natures, we may begin to discard the desires and longings that make for future pain; we may cease to set up causes that have made so much of trouble and confusion in the world's life; cease to be puppets of fraud and ambition, and begin to attain to the true dignity of a being assured of his immortality. And the key of this progress? It is very simple and very complete, and the last turn of it will make of man a god, but all the way it makes for peace and freedom—it is to *act in line with universal brotherhood as the Law of Laws.* W.

### Thoughts on Contentment

WHEREVER we look in the world we find that everything is dual in its nature. We find it among all living beings, and we find it equally as much in the world of ideas. So it is with contentment; it may be a virtue, or it may be a hindrance. We are advised by the sage to be "content with whatsoever cometh to pass," and yet we know full well that it is only by our *not* being content with everything that the world moves onward in its evolution.

It all depends upon the standpoint from which we view things and events; whether we look upon life with the eyes of the little, personal self, or through the real windows of the soul. It depends upon whether we are prompted by our desires, or whether we, through compassion, are eager to remove whatever may hinder all real progress toward perfection. This is simply another application of what the *Bhagavad Gîtâ* calls "action in inaction, inaction in action."

We are then first of all to learn to distinguish the essential from the non-essential. In one sense, of course, everything is essential; but there are many things which, while they do affect us, yet do so only because we weakly permit it. Man should be superior to his surroundings, should be so filled with the warrior-spirit that he can rise above all personal discomforts and disappointments. He must be the master of his desires, must look beyond the momentary pain and pleasure, nay, must learn to subordinate any personal benefit, be it ever so great and lasting, to the benefits of others, the benefit of the whole.

Some say that this is a gloomy view to take of life, but they think so simply because they have never tried it in the right spirit. They have preached contentment while filled with discontent and chafing under the yoke of desire. They have tried to *avoid* being discontented instead of leaving all that to the Great Law, simply putting their shoulder to the wheel wherever they saw others suffering. They would forget even *that* suffering through the joy they would see beyond. Their only discontent would be that of the reformer, and they would constantly live in a world full of light and gladness, "content with whatsoever cometh to pass."

THERE are two kinds of contentment, one that kills progress and one that is the only condition under which real progress is possible. The first is the ease-loving contentment which is satisfied with present conditions and opposed to change; the second is reliance on the Law, faith that whatever comes has its purpose and that every effort will have its just effect. One whose discontent has marred

his life is either a seeker of personal ends, or has not adapted himself to the conditions among which he is thrown. One who attempts to gratify the longings of the lower self will always be dissatisfied, for its demands are endless and even if fulfilled they bring no peace. The other class of discontented people think they were made for greater things than they have ever been able to achieve; who for their obscure position blame their parents, necessity, or fate; who cannot see that their surroundings might be made stepping stones instead of mill stones which they are pleased to think fate has tied about their necks.

One great secret of contentment is not having one's heart set on the attainment of any personal end, but to be ready to meet the emergency of the hour, confident that by noble effort he is doing his duty and building for the future.

THERE is indeed need to study the cause for so much unrest. A little reflection soon reveals that the desire to attain is misunderstood: that nothing but that peace which the light of the soul pours forth, can bring contentment into life. Quite the reverse is it to be placidly contented with one's self and shut one's eyes to the evil committed in social and public life, while the simple effort to right some of the wrongs is within our power by consciously doing that which is right and which would soon outweigh the wrong. Again, by finding out our shortcomings we are apt to become wholly discontented with ourselves, running to the other extreme.

The cheerful performance of duty and the knowledge that our lives are governed by the law of absolute justice can alone bring true contentment.

CONTENTMENT is natural. All nature rests in it. Only man is discontented, because of his unfulfilled desires. Yet to be content is to be happy and to verify that "Life is joy." It is this content, this peace and restfulness, which we really long for in all these unfulfilled desires, a contentment which could as easily and naturally be ours, as it is the flower's and the child's, if we did not strain our vision for the unnatural and unsatisfying.

It is not difficult to be contented. It is the easy, proper thing. Nothing is needed but to realize the opportunities that are ours, as also that Law rules everything and all our acts and destinies as well. Realizing all this, we have a sure foundation, and resting on it, we shall be satisfied to act where we are and to be assured of the outcome being taken care of justly.

CONTENTMENT is a condition of the mind not dependent on time, or place, prosperity, or adversity. Selfishness in its varied forms and masks, always brings discontent and unrest.

Contentment does not mean a lack of progress, or settling down satisfied with life as it is. This life is a school of experiences, and real genuine contentment is the result of progressive activity with an unselfish purpose and aim in view.

Duty well performed alone bestows contentment. The royal road to contentment is to live more unselfishly. To think less of self, and more of others, and to strive for the highest welfare of all.

## WHEN I COME BACK

A SONG OF REINCARNATION

G. R. Sims

WHEN I come back another man  
To have another time on earth,  
I'll go upon another plan  
Of making Life the living worth.  
I'll ne'er to keep the pot a-boil  
Rely on work I do myself,  
But just look on while others toil,  
That I may laugh and take the pelf.  
I'll roam the earth with one intent,  
To find its pleasant places out,  
And there my days shall all be spent  
With but myself to think about.  
When I come back to play a part,  
And face again the footlight flare,  
The only ills to touch my heart  
Shall be the ones I have to bear.  
Ah, no! these thoughts come only when  
The Devil whispers in my ear;  
God grant if I come back again  
The hearts of others I may cheer;  
That I may walk where Life is grey,  
To see and know and understand,  
And help the weary on their way,  
And take the lost ones by the hand.—Selected

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** In a recent letter a friend who is seeking a change of environment says: "If I could get somewhere else it would give me a broader view of life. What a benefit to have a change from our present environment." Will the Forum please answer this?

**Answer** From one standpoint this is all true enough; yet it is absurd for a man to say that to be somewhere else would broaden his view of life. The rustic who has never been farther than twenty miles from his native village, and whose whole world consists of village affairs and the sayings and doings of his cronies and gossips—when he goes to the city something does happen, and to a part of him, too, that may be called his mind. But has he ever heard or thought of such a thing as his "view of life," or the possibility of broadening it? The idea is foreign to him, and not to be dreamed of. He comes back confused, and with jangled, disproportionate thoughts. The village is no longer the whole world for him; his sky is cracked, nay, smashed in places, and the draft blows intermittently in upon him from an inconceivable, impossible world beyond. There is no longer the fine old dogmatic certainty; some atmosphere of illusion and bewilderment has come to surround the very pigs and cattle themselves. All the familiar things are hampered with a doubt as to their supreme value. This man is quite devoid of self-consciousness in a sense; he may be selfish enough, but he has never so much as taken one peep at his own mind, and does not know what troglodytish and tentacled thing is sprawling there, to move the slow gray matter in his skull. Its own growth and stagnancy are ideas, the shadow of whose wings were never reflected on the waters of his mind. A view of life is aeons in front of him. Men and beasts and circumstances move before him and are dumb; only those to whom they speak their message in some sort can be said to have any view of life at all.

So that if a man laments his narrow views as having grown awry in his dwarfed environ-

ment, wry-necked and stunted by the latter, we ought to know that there is something else which he has left out of his account, an individual factor which would explain everything.

Give a man the most restricted environment in the world, let only the most tranquil human experience filter in upon him day by day; and if he would treat it rightly and as he should, every atom of event that came to him could be unpacked of world-wide, age-long dramas. Does but one man come near you in the day? He is typical of all humanity, in compact of the warfare of ages; all philosophy treats of him; all compassion was on account of him; he is bringing you the fruitage of your own past and the seed of your own future; read him rightly and you have read the fate and antecedents of mankind. Can you not grow in such surroundings? It is really the soul that attends to growing, and all true growth is from within outwards. The will is the whole key and secret of it all; it can seize upon the contents of every moment and make them food for the soul, whether the moment come to you in the desert or in the cornfield, in solitude, or among thousands.

So much from what we might call a *pronaos* standpoint; but the Knowledge of Theosophy will carry us much farther. For what reason has the soul chosen this environment or that, at the time when it was considering its coming embodiment? "The universe exists for the purposes of soul," says William Q. Judge, and the surroundings into which the soul comes in each are not chosen at haphazard, but because of all possible surroundings they are the ones which will most meet its needs. Have its manifestations or personalities shunned the giving out of sympathy, have they encased themselves in the pinchbeck armor of self-love? Where shall they learn the new lesson? Perhaps most aptly in those surroundings which seem to us most deplorable, where squalor and sorrow are perpetually jogging them out of all complacency. Yet the change will be blessed for them too, as soon as it is permitted to come about. As soon as any lesson is learned, the Law detains you no longer in the class appointed for its learning. Have you gained something of compassion? Then you may pass on. Has the iron of your hard life entered into your soul a little, is your back straight and your eye keen and steady? Why then, the Law is the true economist, and will waste no time over you; you have other lessons now to learn, and will find a new, and the only appropriate, place, for learning them. Not by any means will you escape coming into that new place, or maintain yourself any longer in the old environment. For all these things do in reality flow out from the soul itself and are not apart from us; we made them; no, day by day we actually are making them; we spin them out from ourselves as a spider her web; it is the spinner you must alter, for he can but pattern and re-pattern himself through the loom. "The things thou fliest are with thee: mend thyself therefore and end thy burden."

And have we not a duty in respect to our environment? Is not this a great responsibility and do you wish to escape from it? Be sure that as you faithfully fulfil it so shall you make possible for yourself new environment.

But be sure that if you seek the highest you will be tried to the uttermost in whatever environment you may be. L. K.

**Answer II.** To help in a further understanding of the subject of environment, the following extract from an article by William Q. Judge is most valuable. Referring to the student who seeks to enter upon the pathway of knowledge, he says:

He is unconsciously much affected by the education not only of himself but also of his nation through all these centuries. He has inherited tendencies that are hard to be overcome. He battles with phantasms, real for him but mere dreams for the student who has been brought up under other influences.

When, therefore, he is told to rise above the body, to conquer it, to subdue his passion, his vanity, anger, and ambition, he asks, "What if borne down by this environment, which I am involuntarily born into, I shall fail?" Then when told that he must fight or die in the struggle, he may reply that the doctrine of Karma is cold and cruel because it holds him responsible for the consequences which appear to be the result of that unsought environment. It then becomes with him a question whether to fight or die, or to swim on with the current careless as to its conclusion but happy if perhaps it shall carry him into smooth water whose shores are elysian.

... What then of environment and what of its power over us?

Is environment Karma or is it Reincarnation? The Law is Karma, reincarnation is only an incident. It is one of the means which the Law uses to bring us at last to the true light. The wheel of rebirth is turned over and over again by us in obedience to this law, so that we may at last come to place our entire reliance upon Karma. Nor is our environment Karma itself, for Karma is the subtle power which works in that environment.

There is nothing but the SELF—using the word as Max Müller does to designate the Supreme Soul—and its environment. The Aryans for the latter word use the word *Kosams* or sheaths. So that there is only this Self and the various sheaths by which it is clothed, beginning with the most intangible and coming down to the body, while outside of that and common to all is what is commonly known as environment, whereas the word should be held to include all that is not The Self.

How unphilosophical, therefore, it is to quarrel with our surroundings, and to desire to escape from them? We only escape one kind to immediately fall into another. And even did we come into the society of the wisest devotees we would still carry the environment of the Self in our own bodies, which will always be our enemy so long as we do not know what it is in all its smallest details. Coming down then to the particular person, it is plain that that part of the environment which consists in the circumstances of life and personal surroundings is only an incident, and that the real environment to be understood and cared about is that which Karma itself inheres in us.

Thus we see that it is a mistake to say—as we often hear it said—"If he only had a fair chance; if his surroundings were more favorable he would do better," since he really *could not* be in any other circumstances at that time, for if he were, it would not be he but someone else. It must be necessary for him to pass through those identical trials and disadvantages to perfect the self; and it is only because we see but an infinitesimal part of the long series that any apparent confusion or difficulty arises. So our strife will be, not to escape from anything, but to realize that these coverings or sheaths are an integral portion of ourselves, which we must fully understand before we can change the abhorred surroundings. This is done by acknowledging the unity of spirit. We then come into harmony with the Supreme Soul, with the whole universe, and no environment is detrimental.

The very first step is to rise from considering the mere outside delusive environment, knowing it to be the result of past lives, the fruition of Karma done, and say with Uddālaka in speaking to his son: "All this universe has the Deity for its life. That Deity is the Truth. He is the Universal Soul. He thou art, O Svetaketu!"

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Science and the Purpose of Life

It is not the views that a man holds or the dogmas he believes in that are of importance for his fellow-creatures: it is his acts. Even the loftiest dreams above the clouds are of but little avail if they do not lead to action.

"A man is his own star;  
Our acts our angels are,  
For good or ill."

WITH these wholesome words, Dr. Fridtjof Nansen concludes an address on "Science and the Purpose of Life," which is printed in *The Hibbert Journal* (July). But his intuitions seem considerably encumbered by certain dogmas which he sets forth. He begins:

In the beginning of history men were groping in spiritual darkness. In their hard struggle with the forces of nature, they took refuge in grotesque superstitions adapted to their childish ideas in order to give them consolation in their feeling of weakness; and they gradually learned some crude moralities in their struggle for existence. But as understanding grew . . . many of the grotesque and childish superstitions were gradually put away, and more developed and dignified ethical ideas were attained. This development . . . has gone on and is still going on. It would indeed be very conceited to think that we had now reached maturity. We are only in what might be called youth.

This might be called the historical superstition or dogma. It is based first on medieval theological teaching as to the age of the earth and man; teaching which Dr. Nansen himself derides further on; secondly on a very incomplete and inchoate study of nature which was begun not long ago by European science. It is backed up by the colossal destruction of ancient records which preceded the rise of our race, but it is rapidly crumbling before the advance of archaeology and the study of ancient texts.

Had not Diocletian burned the esoteric works of the Egyptians in 296, together with their books on alchemy . . . Caesar 700,000 rolls at Alexandria, and Leo Isaurus 300,000 at Constantinople (8th century); and the Mahomedans all they could lay their sacrilegious hands on—the world might know today more of Atlantis than it does.—*The Secret Doctrine*, II, 763, note.

It is impossible to trace any such rise of humanity from childish barbarism up to modern enlightenment, as is supposed to have taken place. Instead, we find that in all times we can reach back to, and back beyond them, there have always been on earth civilization and barbarism side by side. Further, we find evidence that races preceding ours had attained their zenith of enlightenment and stood even above our own present level, bequeathing their knowledge to later races; then it was gradually lost through misuse and profanation as the world entered on one of its dark cycles. Our own advance marks the recovery of a portion of this former

## MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

knowledge. Next Dr. Nansen distinguishes between ethics and religion.

The grotesque superstitions of childhood and the religious dogmas of every age have been continually changing with the growth of human thought, ethical ideas having early reached a comparatively high level; and certain leading principles at any rate laid down at an early time, have changed comparatively little. . . . I give as examples the ethical ideas of the Greek religion, of Buddhism, and of Christianity. It cannot be denied that these religions, as far as dogmas or superstitions go, differ widely; but if we look at their ethical views, we must admit that they are more or less alike.

The explanation of this fact is evident. Our ethical ideas are based upon the fundamental laws regulating the development of the organic world, whilst religious dogmas belong to an entirely different sphere, something outside this world. Men took refuge in the first grotesque religious superstition, and the belief in supernatural powers, in their desire to live and in their fear to die.

The ethical ideas of the citizens, we are told, are of the greatest importance, whilst a man's religious dogmas should be entirely his private concern.

Is it not clear that the writer is trying to bring out the idea that the true basis of life is knowledge, science, the experience gained by man through the use of his faculties; but that in giving expression to this idea he is hampered by conventional dogmas and ruts of thought? Ethics, he says, are eternally recognized and unchanging in their essentials; but he bases them on "the fundamental laws regulating the development of the organic world," and in sharp contradistinction makes religious ideas have nothing to do with such fundamental laws. Thus he confuses present-day science with science in general and makes his ethics lean too much on modern science, which after all is (in its theoretical part) largely a mass of fluctuating dogmas. The astronomical view of the world's history is set forth at some length: all about the cooling sun, the radiation of heat in space whereby the "temperature of space" (!) is raised, etc. He asks, "How ought we to meet all these views?" and answers, "By striving to adapt ourselves to them, not by trying to deny them as some religious people do." In the course of this discussion he says:

No truth lives for ever, and every truth has its time; but when its time has come, it is as futile to fight against it as to uphold it after its time has passed.

Surely the word "truth" is misused here! One must rather say that, while truths are unchanging, dogmas are not.

When asking what is the purpose of all the cosmic phenomena, we are told that "purpose is an idea which entirely belongs to the organic world . . . but this is not a principle that can be applied to energy. To ask, therefore, what is the purpose of life . . . is a question of very much the same kind as if one were to ask what is the purpose of the rotation of the earth." Young people—

Should learn to understand that when they ask for the purpose of life, or even the purpose of the universe, they ask a question to which science gives no answer. They have left the world of experience and gone into the world of faith.

Faith is necessary, he continues, but ethics should be based on a view of things attained by experience and observation, so that it can stand the test of life and not be shaken by changes in faith and dogmas. He relates a talk between a clergyman and an "agnostic," the former of whom declared that, if he did not believe in the after-life, he would certainly devote himself to pleasure; while the latter declared that he based his morality on harmony in life and the happiness which the attainment of such harmony could bring him.

Thus it is evident that the writer perceives that the one eternal sanction for morality is the perception of truth, and that this alone can withstand the changes in belief, wherefore we ought to inculcate this principle in our youth. But he scarcely realizes what Science is, apparently imagining it to be confined to the results of observation by the physical senses and the unaided inferences of the brain-mind therefrom. Also he errs enormously in imagining that all religious ideas are due solely to childish gropings after truth and to the desire to invent a ground for faith. His absurdly inadequate notions of human history are responsible for this. Religious symbolism, as we find it today, and as we find it in its degraded forms in history, is what remains of the terminology of the religious Science of antiquity; and we ignorant moderns have misunderstood its significance, having so recently emerged from our own national childhood (if we have yet emerged).

By all means, we say, let the future standards of humanity be grounded on knowledge and experience, but not on the sole and changing dogmas of science. For it is not everyone who can so triumphantly surmount these dogmas as Dr. Nansen seems to have been able to do, and preserve such a cheerful practical optimism in face of a belief in the mechanical and purposeless character of the cosmic forces. The rotation of the earth has a purpose; it is only sheer dogmatism that can divide the powers of the universe into two sorts, one purposeful and the other purposeless; the distinction between organic and inorganic is of degree, not of kind. If the above shows anything, it surely shows how sorely a well-meaning and struggling humanity needs teachings that shall square with its intuitions instead of thwarting them: how it needs a basis on which to build the ethical teachings it proposes to give to its youth. E.

## THE THEOSOPHICAL ADDRESS AT ISIS THEATER

"ETERNAL LIFE" was the subject of a most interesting address given by Mr. Cranstone Woodhead at Isis Theater last Sunday evening.

The music program, consisting of the following, was furnished by students of Isis Conservatory:

Overture	Rienzi	Wagner
Violin Solo	Romance Andalusia	Sarasate
"Prieslied"	Fr. Die Meistersinger	Wagner
(Organ and Piano)		
Fabrice-Marsch	Kretschmer	

In opening, Mr. Woodhead referred to the impossibility of adequately defining life, and said that although we use other terms, we come back to the one word "life" as being the most expressive. The student of the Secret Doctrine of the ancient sages, he declared, finds in it the most complete expression of human knowledge regarding the One Life or Deity from which sprang the whole universe, and in which our world and all the countless worlds are suspended as in an ocean. Although life appears in many forms, yet there is only one life-power which is in all creation. In essence, the life of man is the same as that of everything with which he comes in daily contact.

There are countless myriads of lives, numberless as the sands of the sea. These pass through every sort of experience on an eternal journey of progress. Dissolved from one form they re-appear a step higher in other forms of countless variation.

Modern science has had much to say lately regarding evidences of life and consciousness in matter hitherto supposed to be without life. Passing from the mineral kingdom through an infinitude of gradation, kingdom after kingdom is built up until we come to man. What then is the difference between the life of man and that of the other kingdoms? The body of man is evidently the most highly evolved visible matter in the universe. Is it not evident that some climax has been reached which is worthy of our most serious investigation? The study of Theosophy teaches us here to look towards the invisible and to recognize that visible matter is but an outward form built around that which no physical eye can see. The power to do this rests with man alone. Endowed with consciousness, his intelligence makes him the connecting link between visible and invisible creation. In man life approaches divinity, and he stands at the crucial point of the ascent as the responsible agent of the creative life force.

The life that is possessed by, and appears to be separate in, separate human beings is not really separate. There is only the One Life, and no one can in reality speak of his life as being separate from that of others. It is common to all; not only the life of the world, but its thoughts and aspirations are in reality all one. Yet this does not destroy individuality. As individual egos our pathway lies in a road of never-ending advancement. The goal that lies before us is that of perfection, and only eternal life can suffice for this; and as in far distant ages the world will be resolved into the Great Primal Cause, man will pass with it into full knowledge of the One Eternal Life.

OBSERVER

### "The Devil!"

God said: "I will create  
A world in the air."  
Satan heard and answered:  
"I will be there!"

God said: "I will make of man  
A creature supreme!"  
Satan answered: "I will destroy  
Thy splendid dream!"

God said: "I will ordain  
That thou shalt no longer be!"  
Satan answered: "Thou canst not, Lord,  
For I am a part of Thee!"

—Marie Corelli

MARIE CORELLI is by no means the first and only person to make such comparisons between God and the Devil. It has always been a moot question as to which is really the more powerful of the two. It has even been questioned which is the more respectable and useful to humanity! Edward Carpenter has a poem in which Satan wrestles with a man, and throws him again and again, until at last the man gets so strong by practice that he throws Satan; then Satan embraces him, calls him his beloved son, and says he was waiting for this glad day.

The opera *Faust* is just now being revived in London; and, needless to say, it is not Faust himself, nor Marguerite, that lends the undying attention to that allegory.

In the *Book of Job*, Satan is made one of the Sons of God and is assigned the duty of developing Job, which he successfully accomplishes. In *Isaiah*, Lucifer (i. e., "Light-Bringer") is called "Son of the Morning."

A modern Russian novelist, Mérejkovski, has written a series of novels "animated by a single master-idea, the Pagano-Christian dualism of our human nature." Says Herbert Trench, who translates his novels:

What specially interests Mérejkovski in the vast spectacle of human affairs is the everlasting contest between the idea of a God-Man and the idea of a Man-God; that is to say, between the conception of a God incarnate for a while (as in Christ) and the conception of Man himself as God—gradually evolving higher types of splendid and ruling character which draw after them the generations.

The novelist's own doctrine seems to be that both the Pagan and Christian elements in our nature, although distinct elements, are equally legitimate and sacred. . . . He conceives that European civilization has been born of the tremendous conflict between these two main ideas.

In one of these novels a sage says: "Ah! If thou canst make one the truth of the Titan and the truth of the Galilean, thou wilt be greater than any that have been born of women!"

Has not the Russian romancer here touched the truth? He loves Paganism, but is compelled to depict its failure; he despises the Christianity of those times, yet is obliged to admit the truth of the Christ ideal. *Neither late Paganism nor early Christianity succeeded, because each was only a half.* That is the point. He who can blend them (blend the essential principle in each) into one—he is a master of Wisdom.

Here is the Theosophical teaching—a very old one revived: that the Verbum, the Word proceeding from "God," though One in its essence, *becomes dual as soon as it enters into Man and becomes manifest in him.*

"The Logos is passive Wisdom in Heaven, and Conscious, Self-Active Wisdom on Earth," we are

taught. (*The Secret Doctrine*, by H. P. Blavatsky, vol. II, p. 231.)

The Logos—who is Wisdom, but who as the opponent of ignorance, is Satan or Lucifer at the same time. This remark refers to divine Wisdom falling like lightning on, and quickening the intellects of those who fight the devils of ignorance and superstition. (*Ibid.* p. 230.)

Lucifer is divine and terrestrial light, the "Holy Ghost" and "Satan" at one and the same time. . . . The Fall was the result of man's knowledge, for his "eyes were opened." Indeed, he was taught Wisdom and the hidden knowledge by the "Fallen Angel," for the latter had become from that day his Manas, Mind and Self-consciousness. In each of us that golden thread of continuous life . . . is from the beginning of our appearance on this earth. . . .

And now it stands proven that Satan, or the Red Fiery Dragon, the "Lord of Phosphorus" (brimstone was a theological improvement), and Lucifer, or "Light-Bearer," is in us: it is our Mind—our tempter and Redeemer, our intelligent liberator and Savior from pure animalism. Without this principle—the emanation of the very essence of the pure divine principle Mahat (Intelligence), which radiates direct from the Divine Mind—we would surely be no better than animals. . . .

Thus, esoteric philosophy shows that man is truly the manifested deity in both its aspects—good and evil, but theology cannot admit this philosophical truth. (*Ibid.* p. 513 et seq.)

Every student of Theosophy knows that one of its characteristic teachings is that God is in Man, and Man hence is a potential God; and that in this, Theosophy merely repeats the ancient tenet that "Christ" is the perfected Man, made God by the full manifestation of his Divine potentialities. But the theologians, at some time or another, removed this God from out of Man, converting God into an external deity, actually a mere fetish, and converting Man into a miserable sinner. This was the great sin of the early church, by which the true Christianity was converted into a superstition that wrought so much harm.

Now, having made God into an external deity, separate from Man, they had to do the same for Satan. Satan, as shown above, stood for the mind in Man, that Divine Gift which first "tempts" him and ends by redeeming him. But now Satan was also made into an external deity or demon; as the God in Man had been made into a great extracosmic Deity, so Satan was made his adversary. Thus was born in the heart of Man that fear of his own God-given faculties that led him to renounce (in the name of Christ) all intellect and art, to burn books and destroy temples, and even to refrain from washing and caring for the body.

O, Theology, with thy two Gods, Jehovah and Satan, wherein art thou better than the savage who propitiates his fetishes? Thou hast cut up thy Deity into two separated portions which thou dost worship alternately, having separate days of the week for each. Thou dividest humanity into Pagans and Nazarenes, Cavaliers and Puritans, men of religion and men of science and art. Thou hast made Man afraid of his own faculties, so that the very animals shame him and he continually falls a victim to those faculties which he has profaned and perverted into vices. He oscillates between austerity and licentiousness; he is a hypocrite. The old "Pagan Joy, Pagan Serenity, Pagan Confidence," what has become of them? Must we ever associate them with their own profanations? Can we never have the Pagan Joy and Pagan Purity and Serenity

without the license of the last Pagan corruption? (But was that corruption worse than our own today?)

But we have not been successful in the attempt to sunder our Divine Self into two halves: Satan is still "a part of God." We know that our Mind and our aspirations are God-given and beneficent; we take our theology on sufferance.

The problem of Good and Evil is one that we can rightly assign. Evil, for Man, is that which tends to keep him from progressing in Wisdom and Weal—tends to destroy him. Good is that which makes the other way. Evil is ignorance, Good is knowledge. Evil is cowardice; Good is courage. And have we not been cowards—hated word! What have we done towards our own God-given faculties? Have we not cowered before them and cringed in supplication before an imagined throne of "mercy," asking to be let off, protected? Are there people who, *having failed in mastering their lower nature, have recoiled from the struggle and taken refuge in an attitude of non-combatant negative "goodness"?* Such people are traitors to their Lord and Master.

Theology talks about the sacrifice of Deity in his Son. What was that sacrifice? Was it not that the Son, out of his love, descended into mortal form, imprisoned himself in the clay in voluntary exile from the light, that through long ages of pilgrimage he might redeem mankind and lead his terrestrial brother up to walk with him on high? O, Lucifer, thou Light-Bringer! how art thou fallen from heaven! How has Man used his Divine Guest! What does he do with the beautiful pure Light *within him*? He denies it, rejects it, calls it evil; and that in the name of Goodness!

Theology talks about a Savior. The Savior is our God-given *intelligence*—"Satan"! Whatever else can save Man? Whatever else has ever saved him? Has he not always, time and again, time and again, been driven back upon this, as superstition after superstition failed? They read history right who discern that the whole purpose of the Divine Powers back of Man is to make him bestir himself and to throw him back upon his own resources. But Man is always saying "I can't!" and is always "doing a wheedle." He rubs himself up against his God like a cat and purrs; and is sent about his business and told to go and catch mice *himself*.

How often have we seen the spectacle of poor Man trying to coax his God. First he brings flowers, and if that won't do he tries cutting himself. But God ignores both the incense and the blood; the ungrateful Deity leaves Man in the lurch. Then Man rebels, rises up in his might, feels uncommonly wicked, and says he will defy God. And God begins to hope for him, but dares not notice him for fear of upsetting him again. But Man's first feeble attempts at independence usually take the form of weak lapses into intemperance and petty vices, from which he is apt to react back again to narrow austerity when his vices are played out. When are we ever going to get out of this petty circle of weaknesses?

What the Divine Power is urging us to do is to take the unruly steed of our lower nature in our own strong hands and master him ourselves, using every power we possess. All

the circumstances of life conspire to drive us into this corner and to put us into such a position that no other escape is possible. Rebellion against the fetishes of Doubt and Fear and Superstition and Dogma must come to each one at some moment; and then he finds his strength. He then realizes that the two poles of slavery and license are equally detrimental to the Soul, and he declares his independence of both.

This is one of the ancient Mysteries; it is still revealed to whomever is capable of receiving it. The ancient ceremonies of the Mysteries were designed to lead the candidate to the point where this self-revelation could come. Nowadays we hear many voices preaching all kinds of doctrines and running to all kinds of extremes; but the new gospels are all very old and threadbare. The eternal truth remains that Man is his own Savior—not by his perverse will, but by the Divine Intelligence which he has the power to evoke. But this Divine comes not in answer to appeals for external aid; it comes through Man's own resolve to *exercise* it. "Heaven helps those who help themselves."

H. P. Blavatsky threw down the gauntlet to dogmatic ignorance by naming her magazine "*Lucifer*," in honor of the bright morning star, Light-Bringer to Man, Venus-Lucifer, Satan, whose name has been so horribly blasphemed. For her work initiated the restoration of honor to the crucified God in Man. We have to recognize the two poles: the Logos manifested as the Christos of compassion and renunciation; and the Logos manifested as Mind. Yet they are *One*. These two poles are as mutually necessary as are Darkness and Light. "Be ye wise as Serpents and harmless as doves." We have religions—other ones besides Christianity—that teach the renunciation of worldly things, and, misunderstanding the teaching, advocate the beggar's wallet. We rightly rebel against such doctrines. On the other hand we have mental anarchists teaching the glorification of unbridled passion, and we rightly rebel against them too. Let us have a religion that teaches men to be Men, living in the earth and using it aright. Let us have a religion that fears not the Mind, that is not bound down by false history, and that is wide enough to embrace the whole of life.

#### Cleaning Fabrics by Electrolysis

A NEW process for washing fabrics by electrolysis, invented by a Frenchman who has secured a United States patent, is described. After fabrics have been filled and bleached, there usually ensues a long and difficult washing process which requires a large supply of water and involves a great waste both of soap and of the fatty acids and oil. Moreover the washing is seldom complete, so that residual oil causes spots when the fabrics are dyed. It is well known that in the saponification of grease films of soap are formed around particles of fat, which brings the process to a premature close, leaving some of the grease unsaponified; and much mechanical treatment is required to overcome this difficulty. But the new invention provides for the use of electrolytic action in the saponification, whereby the particles are kept in motion and the process does not clog. The cloth passes

between electrodes in a solution of alkalis, and every fiber of it is subjected to the chemical action, so that it passes nearly clean to subsequent vats where the washing is completed. The oils, alkalis and soaps in the first liquor are afterwards sorted out and recovered by electrolysis.

#### Clothing Made of Spun Glass

IN future editions of word-books we may expect to find something like the following: "New: synonyms—novel, recent, modern, known to the ancient Egyptians."

The art of spinning glass for practical purposes is new and "would appear to have been practised by the ancient Egyptians." It has long been known as a curiosity, and many people must be familiar with itinerant glass-blowers who make beautiful rigged ships out of it; they melt the end of a glass rod in a blowpipe and throw the thread over a broad-rimmed spinning wheel, drawing off a long skein of the glass-silk which they sell you. A Frenchman in the middle of last century developed the process along commercial lines, but died without revealing his secrets. These seem, however to have been recently rediscovered in Germany.

Glass thus drawn out into very thin threads is flexible and it is thought it will be possible to spin and weave it into clothes. These garments would be incombustible, non-conducting, and impervious to acids. They can be beautifully tinted by using tinted glass. The insulating properties of the glass-wool would render it valuable as packing where it is desirable to keep in or exclude heat. In this case we should be resorting to the mineral kingdom for our clothes, though as yet we have not got those asbestos garments which could be washed by throwing them on the fire.

T.

#### Wireless Telephony

REMARKABLE progress in the field of scientific and commercial telephony has been made, both in America and Europe. Audible communication was established recently, it appears, at a distance of over eighty miles. The apparatus for this is complex, and the initial current used was 500 volts.

What with aerial flight, rays that see through stone walls, and wireless telephony, science seems bent upon reproducing, in what is facetiously termed the inorganic kingdom of nature, the powers and potentialities which reside in man himself. Perhaps this is under some sympathetic cyclic law. But when is all this externalizing of ourselves going to stop? Scattered through the pages of history, and sometimes even among the happenings of our own unimportant lives, are flashes of these things, called mysterious and occult, merely because unwonted. Theosophy does not say we should seek for them, any more than Paul did; yet, being sane common sense, it by no means denies their existence.

Could we see, hear, and move in the subtler etheric spaces, what odd things would impinge on our consciousness! We might even hear suns and planets talking across space! Fancy tapping a talk of this kind:

SUN: "Hello, Earth! Time to clean up a bit, isn't it?"

EARTH: "Well, yes! Just postponed a few cataclysms the other day, though!"

## Welsh Literature—Prose—Ninth Article

ROMANCES IN THE RED BOOK OF HERGEST  
(CONTINUED)

THE last division of the tales in the Red Book includes the Dream of Macsen Wledig, the Story of Llud and Llefelys, and the History of Taliesin. No possible tie connects these three; we link them together only because each is in a class of its own.

The Dream of Macsen Wledig is romance, with a dash of poetry in it; no mere spinning out of incidents, like the Normanized Arthurian stories. Although of no grand antiquity or value, there is a connecting thread running through it, and it might even be conceived as having some meaning, that is, in an inward sense. We caught a vision once of the beauty of the world, we saw the Soul once, embowered in the innermost place, weaving out rainbows and glamor and glory over the whole universe, and thereafter there was neither peace nor rest for us; two meals, as the Irish stories put it, might not be taken at the same board, nor might we sleep two nights in the same city, till its shining palace should be found.

Macsen Wledig was the Emperor Maximus, who won his fame in Britain, and the purple with a Brython army. It is related that at one time he was hunting in Italy, and being tired, lay down in the forest and slept. He dreamed of a far country and how he came there; of a castle and of the princess it contained. Then sleep and satisfaction forsook him until he should find her. She was Helena of Britain, and he found her at last in Ynys Mon in Cambria, with her brothers, as he had been foreshown in his dream.

The story of Lludd and Llefelys relates to an earlier period. Lludd Llaw Ereint was king of the Island of the Mighty, and Llefelys was the king of Gaul. This Llud is the King Lud, from whose name we have Ludgate in London: of the pronunciation we will say that the doubling of the consonants gives each of them an aspirated sound, while the vowel in Welsh has a sound not remotely resembling the *u* in English. The Coritaniad were at that time in Britain; if the wind heard anything whispered it would come to the knowledge of these people, who were the enemies of the Britons. No plans that could be made were available against them; so that the country was confronted with ruin, near at hand and not to be outstared. There were two other terrible things in the island as well, making three in all. The second was a scream that rang out on May Eve in each year, audible from Cornwall to the north, and bringing sickness or death, or horror and bewilderment, to all who heard it. The third sorrow was that whatever food might be left on the king's table overnight, would have vanished in the morning. Lludd took council with Llefelys, who showed him

the causes of these three oppressions, and how to end them.

The presence of invisible enemies; the war-ringing of two dragons in the air; the nightly raids of a huge black thief whose coming was screened against all watchfulness by music so low and sweet and magical that whoever heard was enchanted, and all memory and purpose fell from him, and sleep overcame him—all these things probably represent forces still hovering around us; they are not dead; we ourselves have to contend with them. You could not tell a Coritan from a wholesome Brython, by reason of the Coritanian magic, yet at all times they were a menace to the whole life of the people. Lludd Llaw Ereint obtained a powder which forced disclosure and death upon them; it had no power to hurt the human races, but for these children of foul magic it was destruction.

partial conceptions. Your myth-maker is a poet; lightning from heaven came down upon him among the mountains, some marvel is forged in his heart by the flame and meteorite, and there is the myth burning and gleaming before him. His own brain-mind shall have as much or as little work as yours or mine to discover its meaning. He had no intention except to serve or worship the gods, that is to say, to hold himself for the universe and evolution, to strike or stand for his fellowmen, to come near to the heart of things. So his creation is god-fashioned, and there shall be seven—seventy times seven—inwardnesses of meaning in it; it is perfect and whole. Whereas the maker of allegories may be a great and good man, as John Bunyan was; but he is working to set forward his own view of things, not to speak out carelessly for the whole Immortal Kindred. Carelessly, that is,

Lomaland Photo. and Engraving Dept.

AN ENGLISH LAKE. (FROM A PAINTING)

Consider the state of the world today, with all the legions and multitudes of hostile forces which we can see arrayed against humanity, forces in the world of thought; not one the damndest of them but is as glib and plausible as to make angels envious. "Take me," says Vivisection, "I am Brython; of the true race; I will bring about the end of disease." "Take me," says Hypnotism, "I will cure you of your vices." "Me," says another, "I will cure you of—" etc., etc., etc.; they are innumerable in their clamor; they all offer gains, palpable gains of one kind and another, hiding it away that the gains they offer may be so many cloaks for infinite loss. What shall be the fine red powder, such as Llud had from Llefelys, with power at once to discriminate, and sweep away the evil?

This is no mere allegory, and must not be treated as such. The myth hits the bull's-eye of truth, and is inevitable in its conclusions. It is modelled on eternal law; it has backbone, head, heart, and members; whereas the allegory is an amoebic thing, set together by some brain-mind to image forth petty and

of what shall be said; or of seeking to frame his own vision in story.

## A WELSH STUDENT IN LOMALAND

### Another Uniting of East and West

RECENT arrivals in New York were two Japanese architects who came for the purpose of studying American theater-construction. Later they will visit Europe for the same purpose. They are representatives of a Tokyo company which is to build a theater in Tokyo modelled on European lines, where the dramas of Shakespeare (most of whose plays are now translated into Japanese) and other Western dramatists will be given. Great Japanese plays will also be given and the purpose is to combine in this new play-house the best of both Orient and Occident. It will be completed in time for the International Exposition which is to be held in Tokyo in 1912. The influence of this enterprise upon the peoples of both East and West will doubtless be farther reaching than is at present easily discernible, and something of undreamed-of beauty and value may well result. STUDENT

### A Remarkable Interview

THE Boston *Herald*, issue of Sunday, Sept. 20, contains the following very interesting sketch and interview with Mrs. Harriet Prescott Spofford:

Just where Deer Island almost fills the big bend of the Merrimac river, in the northeastern corner of Essex county, stands a brown old colonial house, vine-grown and greenly shaded. Between the old and the new it waits. On one side hangs the ancient chain bridge, beyond it the dead beauty of Newburyport. On the other side, over the modern suspension bridge, the road runs straight to the black smoke that covers the mills and manufactories of 20th century Amesbury. Looking closely through the trees, one sees that the house is turned away from all this bustle of modernity and fronts toward Newburyport's past dignities.

Between two worlds the mistress of the house is standing—Mrs. Harriet Prescott Spofford, story-teller, essayist, poet. She was of literary America 50 years ago; she is of literary America today. An early contributor to the pioneer *Atlantic Monthly*, it was only last month that one of the most important of modern magazines published a recent poem of hers. For half a century she has known American literature and the men and women who make it. She has many close friends among the present-day authors. She finds many things to like and admire in present-day literature. But the house in which she has lived for nearly 40 years is not more definitely turned away from the modern town so near it, than is its lady mistress from what she believes to be the general spirit of the literary present in America. Her home faces an old city, she herself looks ever toward the ideals, the standards, of a literary age that is past—"because," she says with her wise little smile, "they are the only ones."

She was in her favorite piazza corner that day she spoke about the old and the new to

the *Herald* reporter; a slim, graceful figure, all in black silk, with a soft scarf of plain chiffon lace over the gray hair. Mending half-worn towels in housewifely fashion as she talked, she only glanced up occasionally to catch the sparkle of the river which flowed so near, or to emphasize some tentative sentence with a smile of approval or regret. She didn't like to regret, for to her condemning books wasn't any abstract thing—she knew the people who wrote them! Always she

### Fragment from OUR RIVER

Written for a Summer Festival at "The Laurels" (the childhood home of Katherine Tingley) on the Merrimac river, by John Greenleaf Whittier.

AND thou, O Mountain-born! no more  
We ask the wise Allotter  
Than for the firmness of thy shore,  
The calmness of thy water,  
The cheerful lights that overlay  
Thy rugged slopes with beauty,  
To match our spirits to our day  
And make a joy of duty.

praised those people, even when she criticised their work, spoke of their beauty and charm and kindness.

"Why, you like everybody!" once interrupted her listener.

"You know, I think you'll find that most people are delightful when you come to know them," Mrs. Spofford responded quietly.

But if she loved the sinners, she nevertheless  
CONDEMNED THE SINS.

"Flippancy is the great trouble with literature today," she said firmly. "People aren't interested in big, vital questions, as they were in the old days. They feel nothing strongly, intensely, any longer—perhaps it's because they feel so many things a little. They lack a great object."

"Then you don't believe that great work can be produced on the art for art's sake plan

—there must be something else behind besides the effort to secure finished technical perfection?" asked the reporter.

"There must always be the strength of sincere purpose, there must be sincere devotion to some cause or causes, in the man or woman who wishes to do great work," Mrs. Spofford replied earnestly. "Of course I don't say that is enough—but that must always be present."

"There is a surplus of the study of 'personality' in the work of modern authors," she went on, drawing her thread very tight and for a moment frowning a little. "People said a while ago that for a long time books had been written for the young girl, with nothing included which she might not see. Then they said, 'This is foolish. We will change it. We will write about anything.' They have"—and one writer's eyes were scornful. "They have written stories dealing with phases of the marriage relation, stories which ought never to have been written. They have taken delight in studying and putting into books any kind of people, no matter how bad—just because they are people. They have raised questions which ought not to exist, discussed things which we ought to put away from us and hide in dark places."

"But they say such things are true—"

"There are plenty of things in the lives of all of us which may be true but which we don't care to exploit before the public," Mrs. Spofford finished. Then she smiled and ended gently, "I am afraid all this sounds terribly Puritanical—but don't you see I believe in marriage as it used to be, and so what is the use of making 'problems' of it?"

There was silence on the piazza for a few minutes. Mrs. Spofford had stopped sewing and was looking dreamily out over the river. "There is another thing I miss in so much modern writing," she half sighed, "and that is so many of the writers are not educated, really. They don't know the classics. They haven't studied other great writers, what they

say, how they say it. And their work, these younger ones, shows that they haven't studied."

"Perhaps they didn't want to," suggested the reporter; "perhaps they thought they could be more original, more independent, if they didn't."

"But how else can they ever learn to express themselves?" queried Mrs. Spofford. "Don't they know how few really great men there are who have not studied the people who came before them? The three great living authors all have done it—Mrs. Humphrey Ward certainly; Swinburne, I suppose; the results of his early education show in his work just the same; and Kipling—oh, yes; that last book, 'Puck of Pook's Hill,' certainly proves his training. Isn't it wonderful?" she added in an enthusiastic little aside, "quite the bravest, best and most charming thing he has published, I think. Like all real children's books, it is made for grown people, too."

"How do you compare the literary work here and in England at the present time?"

The loyal American's face fell. "What have we on this side of the water," she asked sadly, "to compare with the people I have just mentioned—Kipling for his short stories, Mrs. Ward for her novels, Swinburne for his poetry? Oh, that music of Swinburne; Milton, of course, made the grandest organ music of any poet in the English language. By the way, did you know Tennyson had taken unconsciously whole and half lines from both Milton and Shakespeare? But Swinburne's music is all his own. I don't care for his subjects always; I wonder sometimes if he doesn't think too much of just the music, but yet it is marvelous—like the flutes of Pan playing in the far distance."

"It makes me just

A LITTLE BIT ANGRY,

though," she finished, with a humorous twinkle appearing in the midst of her enthusiasm, "when I know the English all call us 'provincial.' They forget that they have been one race for so many years, and we are just coming together now. We are hardly Americans—and we certainly are every other nation in the world."

"But is it true, do you think," persisted her listener, "that America has never produced any really supreme literary work?"

"No." In her earnestness Mrs. Spofford straightened unconsciously, and her slender fingers gripped her work tight. "Certainly Hawthorne and Emerson were both supreme in their ways—Hawthorne in his prose—there is very little that is finer in the world than the 'Scarlet Letter'—and Emerson in his poetry. Then Miss Anne Whitney has written in modern times poetry which has never been surpassed on this continent—Emerson himself has done nothing better."

"Speaking of Miss Whitney, I think it is fair to say that one really delightful characteristic of modern literature is the fact that the women authors are quite holding their own with the men. On this side, take Mrs. Wharton, Miss Whitney, Miss Alice Brown, Mrs. Margaret Deland, and all the Marys—Mary Wilkins-Freeman, Mary Stewart Cutting, Mary Raymond Shipman Andrews, Mary Heaton Vorse—what men have we who are doing better work? In England, though perhaps no woman is writing short stories which equal Mr. Kipling's, still, what man is there

who is better than Mrs. Humphrey Ward in novel writing?"

But Mrs. Spofford leaned back in her chair now, and her smile held much of charity, with even a hint of self-rebuke. "I really ought not to talk about the modern authors," she murmured. "I'm afraid I don't keep up with them as I ought. I am very busy, for I am a housekeeper, you know, and then one of the penalties of being a writer is to write too much. And when I do go to my books I some way choose the old ones, the ones which I've always read. I never get tired of them. Our own group was wonderful."

Then, not critical any more, Mrs. Spofford began to remember. For she knew all that older group, knew them with varying degrees of intimacy, but really knew all of them. Many she had entertained at her own home, particularly her near neighbor, Whittier. Lowell, too, had been there, and Mr. James T. Fields, and his wife, and Mrs. Louise Chandler Moulton, of whom Mrs. Spofford spoke most tenderly.

She had also a funny story to tell, showing where Lowell's keen wit came from. After a theater party his father once asked several friends home to "a light supper," and when they arrived—the dining table gleamed, polished and bare, with the reflections of the scores of candles placed on it according to Mrs. Lowell's orders for the "light supper." The Lowell party had something to eat besides reflections, however.

Hawthorne, too, inspired an amusing little tale. "Really the accounts of his unsociability are not one bit exaggerated," she said. "He did not care to be with people. So one time when he was coming home from Europe he made an arrangement with his son Julian which he thought would keep him from being bored. One sunny afternoon he was pacing the deck with Mr. James T. Fields, who was crossing on the same ship. The two men were deep in literary discussion, when Mr. Hawthorne noticed that he was being 'tagged' most persistently by Julian. He tried dignified unconcern, then obvious frowning, with no avail. Finally Julian brought a small stool and planted himself squarely in front of his father's approaching footsteps. The latter, really annoyed, asked the child why he insisted on getting in the way. Then it was that little Julian responded in injured tones: 'Why, father, you told me that if I saw you talking with anyone more than five minutes I should come and whisper to you that mother wanted you—and now you won't give me a chance.'"

Relations between Mr. and Mrs. Fields and Mrs. Spofford were always delightful. One of her earliest stories to be published in the *Atlantic Monthly*, "The Amber Gods," was shown to Robert Browning by Mr. Fields and met with great approval from him. In that story, as it happened, Mrs. Spofford quotes from Browning, who remarked afterward with characteristic naiveté, "I hope, Fields, you didn't think I knew that was coming!"

It is Mrs. Fields whom Mrs. Spofford describes as "so beautiful that in Rome the people would come under her windows and look up, crying, 'La bella donna!' 'La bella donna!'"

It was at Mrs. Fields' home on Charles street, moreover, that Mrs. Spofford confesses

to have received one of her greatest pleasures. Discussion of modern drama and actors brought up the incident. "When I was 15 years old," said the author slowly, "I heard Mrs. Fanny Kemble read. I have never known anything like it since—never but once. Last winter, at Mrs. Fields', I heard Professor Thomas Whittemore, from Tufts College, I think, read one of Gilbert Murray's translations from Euripides. He was wonderful—almost, if not quite, as good as Mrs. Kemble. His reading is the only thing I can compare with her work." . . .

But after all, it was books over which her quiet sentences lingered longest, the old books she has known and loved for so long. Every thin place in the towels carefully strengthened, she folded them smoothly and then sat for a little space, looking out over the gleaming river, just as she has sat and dreamed her tales and verses so many cool summer mornings and evenings. Now, too, she spoke almost dreamily, mentioning one by one the wonderful old names, Thackeray and Tennyson and the Brownings, Barrie and Hardy of a later day.

"Only I have never forgiven Barrie for killing 'Sentimental Tommy' in the way he did," she confessed. "I don't think that was at all necessary. Hardy is very powerful, even though his philosophy is so depressing."

"But do you believe that the world is so awful as he shows it?" questioned her listener.

"Oh, no, I don't see how any one can think so who believes in God," came the quiet reply.

"What do you consider are the necessary requisites for a writer?" was the last question asked Mrs. Spofford.

Her gray eyes still swept the swiftly flowing river as she pondered. "There are two things," she said at length. "To write, one must be born with something of the power. Also it is necessary to study the best authors continually. But more than all, one must have—" the low voice hesitated for a moment, till suddenly the eyes seemed to focus themselves on the biggest shining sun reflection far out in the river. Then the last words came very clearly. "One must have the desire—the gleam!"

The next moment she rose briskly. "But before you go, wouldn't you like to see the place?" she cried. She led the way over the long, lovely stretches of it, the green lawns, the gardens—"wherever there's a yard of ground we have a garden," she observed, smilingly—the trailing paths that wound through vine-covered gates to growth of spicy pines and the summer house on the water. Though she was born at Calais, Me., she has been near Newburyport most of the time since she was 14 years old, and came to Deer Island shortly after her marriage with Mr. Richard Spofford in 1865.

At Deer Island she has written most of her best work, tales embodying all the quaint, homely charms of her own New England, verses, with a melody and uplift which have made some discern in her the greatest living American poet. At Deer Island she has graciously received her noted friends, themselves rejoicing in the opportunity to pay homage to her own fame. And at Deer Island she now lives a life which by its very insistence in keeping true to old standards makes in itself her greatest story, her most glorious poem.

# OUR YOUNG FOLK

## The Son of a King

ALBERT was the son of a king in the Mudgee district of Australia and was one of our survey party. I was the surveyor's assistant and Albert and I were great friends. We were often sent out, for days together, ahead of the main party to find camping grounds. One day we were out on one of our camp-finding expeditions across the upper Murrumbidgee where the river ran through a barren gorge on the south side, which we called "across the river." Finding as good a camping-place as possible, near a fine, clear, running creek which ran into the river about half a mile away, we pitched our tent, hobbled our horses, and made everything ready for the main party, which was to follow on next day.

In the morning we went down to the river and found that it had suddenly risen in flood about twenty feet above its ordinary summer level! Albert looked at the river and then at me, and said, "Flood keep up two weeks."

This was pretty serious for our provisions were only for *two days*, and there was no possibility of getting any more on that side of the river, not even a 'possum or a snake, as we found out afterwards. The nearest settlement for miles and miles, and that only one house, was at least thirty miles away over the roughest mountain country, thickly timbered. There was supposed to be a "track" to it, a bridle track, that only a bushman could follow who knew the country; and the only one who knew the country in our party was the surveyor himself. Though the sky was cloudless the river was in flood caused by the melting snow near its source, and Albert knew when that occurred we were in for perhaps two weeks of flood. There was no possibility of swimming over until the river went down a little; for just thereabouts there were many rapids and the flood made the whole river a roaring torrent.

We returned to our camp and Albert advised "short commons" at once—only one meal a day, and that a most sparing one. With all our economy we could not make our food last more than six days. Albert had been hunting round, but could find nothing, and I, searching about at camp, found some old, blue, mouldy crusts at the bottom of a three bushel bag. This was a great find, and why they were not turned out of the bag before we started was a mystery. By dividing up these crusts and using a small piece each day with our tea and sugar, which still held out, we thought we could keep going for another three or four days.

Then Albert told me that "his countrymen when they have very little 'tucker' get up and eat it at three o'clock in the morning." I thought, "Well, that's his way I suppose," and did not bother about it; until after the

MACARONI DRYING ON RACKS, NAPLES, ITALY

recovered and in a day or two were able to go to work again.

He was an aboriginal black, but a "white man" surely, a king's son truly! W.

## Macaroni

IN the picture you see macaroni drying on racks set out in the street in front of the factory in Naples where it is made. This may seem strange to you, but a great deal of the business in Naples, especially among the poorer classes is done on the sidewalks.

Macaroni is used a great deal in Italy for food. It is made of wheat flour in which there is much gluten. After the flour is cooked to a stiff paste it is forced through a series of molds which give it the shape of hollow tubes. These are cut off in lengths of from one to two feet, as they emerge from the molds. The test of good macaroni is in the drying of it. If it keeps its shape during this process it is considered to be of good quality. After it is dry it is broken and put into packages ready to be sold. E. P.

## RUB OR RUST

Ebenezer Elliott

**I**DLER, why lie down to die?

Better rub than rust.

Hark! the lark sings in the sky,

"Die when die thou must!

Day is waking, leaves are shaking,

Better rub than rust."

In the grave there's sleep enough—

"Better rub than rust:

Death, perhaps, is hunger-proof,

Die when die thou must;

Men are mowing, breezes blowing,

Better rub than rust."

He who will not work shall want;

Naught for naught is just,—

Won't do, *must* do, when he *can't*.

"Better rub than rust.

Bees are flying, sloth is dying,

Better rub than rust."

second day I noticed that the crusts seemed only to diminish by the portion I ate, and Albert had been lying down for over a day, and was weaker than I was. Suddenly the truth flashed upon me, *that he had not eaten anything at all! Just left it all for me! Quietly starving himself to death for my sake!* This was too much for me: I determined to swim my horse over that river and get help, or get drowned. So I caught my horse, a half-bred Arab mare who would come to me at call, and was trying to lift my saddle on to her back, but was so weak that I was struggling desperately with it—when I heard crashing through the bush the sound of horses galloping, and looking towards the place where the sound came from, I saw the surveyor in the lead, with white set face, and the rest of the party after him. As he pulled up at the camp, he said with an exclamation, "I thought you would both be dead." Albert and I soon

## Spinning

THE spinning-wheel which seems to us such an old appliance was not invented until 1530. Its inventor was Master Jürgen of Brunswick, Germany. Before that time thread was made altogether in the hands of the spinner. The distaff, the staff or stick upon which the thread-making material was lightly bound, was held under the left arm of the spinner. With the fingers of her left hand she would catch a few of the fibers of the wool, flax, or tow, and twist them into a strand or thread. When it was long enough she would fasten the end to a small stick or spool, which she then held in her right hand down by her right side. Then as she pulled down and twisted the fibers continuously with her left hand, with her right she dexterously twirled the stick or spool, winding the thread upon it.

This ancient method of spinning thread from the distaff has always been known, so far as we know. It was used in ancient Egypt; the women in Homer's poems spin their purple threads from it; it gave its name to ancient Saxon dames, distaff signifying a woman; and today on the hillsides of France and Italy, and in other countries where there is a simple nature-folk content with old ways, one may still see the shepherdesses spinning thread from the distaff under their arm as they watch their flocks. STUDENT

THERE is one road talk never finds, and that is the way into the talker's own hands and feet.—George MacDonald

# THE CHILDREN'S HOUR

## THE FALCON

James Russell Lowell

I KNOW a falcon swift and peerless  
As e'er was cradled in the pine;  
No bird had ever eye so fearless,  
Or wing so strong as this of mine.

The winds not better love to pilot  
A cloud with molten gold o'errun,  
Than him, a little burning islet,  
A star above the coming sun.

For with a lark's heart he doth tower,  
By a glorious upward instinct drawn;  
No bee nestles deeper in the flower  
Than he in the bursting rose of dawn.

No harmless dove, no bird that singeth,  
Shudders to see him overhead;  
The rush of his fierce sweeping bringeth  
To innocent hearts no thrill of dread,

Let fraud and wrong and baseness shiver,  
For still between them and the sky  
The falcon Truth hangs poised forever  
And marks them with his vengeful eye.

## Fleet Week in Sydney

"MY eyes are full of flags, Grandpa," and little Alice rubbed her sleepy eyes with her chubby fists. She was only four, the youngest of the happy little quartet just home from sight-seeing, and gathered round Grandpa to whom they always carried the tale of their joys or woes. "And mine are full of zig-zags from the lights," added Helen, "but it was lovely, just like fairyland."

"You should have seen the ships, Grandpa," said Brian, "they were a sight. Do you think Father will let me be a soldier on a ship when I am older?"

"I suppose you mean a marine," commented the eldest boy, "I heard a man in the street say, 'They are jolly, nice chaps.'"

"So you have been out again to honor the American Fleet?" said the old man kindly.

"I have often heard grown-ups speak of 'the world and his wife,'" Helen began again. "I think he was out last night. Do you think anyone was at home except perhaps a few grandpas and grandmas?"

"The streets were full!" said little Alice with open eyes, "peoples and children everywhere!"

"You should have seen the sailors and marines, Grandpa," Norman began, "didn't we cheer down our end when they went by!" "And the Review was grand." He paused, and Brian broke in:

"And the soldiers were splendid too; what crowds there were, thousands and thousands, all riding."

"And plenty of marching as well," Norman added, "and the cadets—the people didn't know which to cheer the most, the visitors or their own men."

"They all seemed the same," said Helen reflectively; "they were not a bit like strangers."

"I guess they are friends!" And Brian waved two miniature flags of the Australian Commonwealth and the United States.

## SWEDISH LOTUS CHILDREN AMONG THE BLOSSOMS

"I think it is *Brotherhood*, don't you, Grandpa?" asked little Alice; and the old man though it was.

"'Universal Brotherhood,'" he quoted softly to himself as the young folks went their way, "'is a fact in nature'—and who knows where it will crop out in the new day that Theosophy shows us is dawning, the cycle of Unity. Blessed is the work of the grand pioneers, H. P. Blavatsky, William Q. Judge, and Katherine Tingley." E. I. W.

## Deep Sea Life

A WAY down near the floor of the ocean, deeper down than the highest mountain-top is high, it is darker than the darkest dark you can imagine. Yet there is life even at this great depth. There are tiny living creatures, so small that it takes a microscope to see them; fishes of all sizes and many kinds; and great sea-monsters. Some of these animals down in this world of night are blind. They have, however, senses by which they can tell what is happening around them, just as the cat "sees" with his whiskers in the dark.

But there are other fishes, which have eyes that see, even down in their world of blackness. How do you think they manage it? Why, they do just what we do. At night we light our cities and our houses with electric lights. The fishes do the same in their watery depths where it is always night with no stars in the water above them. Only instead of a central electric light machine, which lights a whole city, each fish has his own machine inside of him, and makes his own electricity.

Each fish, as he swims about, carries a tiny electric lamp with him, just as in Japan the people go through the cities at night, each with his lighted lantern swinging from his pole.

This is a lovely sight in beautiful Japan, but think how much grander it must be in the depths of the ocean. Myriads of brilliant electric lights darting hither and thither, balls of light, arrows of light, trains of sparks like shooting-stars, and great sea-monsters aflame with light like comets, all illuminating great spaces of water larger than our largest cities.

Thus the One Great Life makes even the darkest depths of ocean beautiful with light and life and fits every tiniest and greatest creature to the place where he must dwell.

O. W.

## The Lotus

DEAR CHILDREN: There are a great many things that little folk can do, if they will. This is quite plain to me when I hear that there are many stupid, ignorant, and uncharitable people who poke fun at the word Lotus. It was not long ago that in quite a number of the papers published in America some writers showed their ignorance or ill-will; for they tried to make the word Lotus very mysterious and queer and something to be ashamed or afraid of. Of course you are wise enough

to know that they would not have done this, if they had not thought that there were many ill-meaning people like themselves, who would like to see the Râja Yoga work not succeed. This is not the first time that wicked words and methods have been used against beautiful truths. Nearly every Teacher who has made an effort to help humanity has been crucified just as truths have been, and we must expect all this just as long as we are not doing our part to place knowledge where there is now ignorance, and to make honesty and love two great things in the world's work. The Lotus flower is very beautiful, as you all know; it is an emblem of purity, and it has grown to its beauty and fulness out of the mud. How appropriate is this name Lotus for the children workers. They too can grow out of all that is wrong and sad in life and become pure and holy things, sweet flowers, blossoming Lotuses. Dear children, we are very proud of the name, and whenever we think of it we try to become a little more like a lotus, with an unselfish thought here, a noble action there, for a continuous trying to be true and unselfish brings us into a golden glow of beautiful service. And thus we become little teachers; rebuking in the sweet spirit of charity the ignorant and the malicious, we show them as we also show others the royal way to happiness through the example we set before them.

# THE MYSTERIES OF THE HEART DOCTRINE

Prepared by  
**KATHERINE TINGLEY**  
AND HER PUPILS

*The Theosophical  
book of the  
Twentieth century*

Tells the story and the history of the  
Theosophical Movement.

The prices are \$2 in cloth and \$1.25 in  
paper, which barely cover the cost, for it is  
printed and bound, not gaudily, but with  
such carefulness and thoroughness of art  
and craft as to make it unique among  
modern edition books.

Order now from  
**THE THEOSOPHICAL PUBLISHING COMPANY**  
POINT LOMA, CAL.

**Isis Conservatory of Music  
OF THE UNIVERSAL BROTHERHOOD  
AND THEOSOPHICAL SOCIETY**  
POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday  
by the Secretary at SAN DIEGO BRANCH

**ISIS HALL, 1120 FIFTH STREET**

between the hours of 9 A. M. and 4 P. M. Full particu-  
lars will be sent by mail upon application to

**J. H. FUSSELL, Secretary and Treasurer,**  
**Isis Conservatory of Music,**  
Point Loma, California.

**SOME OF THE ERRORS OF CHRISTIAN  
SCIENCE  
CRITICISM**

by **H. P. Blavatsky and William Q. Judge**

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"  
A Note of Warning

—by **H. P. Blavatsky**

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by **William Q. Judge**

A MOST VALUABLE PAMPHLET. Outside of Theosophy  
there is given no adequate explanation of the healing  
that is at times accomplished, nor of its *rational*,  
nor of the ultimate price that must be paid and the  
dangers connected with such practices.

This pamphlet is invaluable to all students.

Price - 15 cents

## Mirages and Nature's Storehouse of Memories

PUBLIC interest has recently been aroused by the reports of curious mirages seen in Ireland and Scotland. What is the cause of such apparitions? What do the text-books teach us on the subject?

The authorities who write upon atmospheric phenomena are guarded in their treatment of this perplexing question. Few of them even mention the more peculiar cases that have been reported from time to time, and such references as are made are brief and unsatisfactory.

We are all familiar with the reports of palm-trees reflected in phantom lakes in arid deserts, and of distant ships being seen inverted and apparently hanging in the air. These are only to be seen under peculiar and uncommon conditions of temperature, which modify the normal density of the air in its lower levels. As the light reflected from the object travels through abnormally hot or cool strata it is bent, and, according to well-known laws of optics, an inverted or elevated image may strike the retina of the eye. The same cause acting irregularly produces distortion in familiar objects such as cliffs, houses, or icebergs.

In Alaska and Greenland the atmospheric distortions of the glittering pinnacles and precipices of ice have given rise to the miragic effect of turreted cities with marble columns and gates of pearl. In San Diego harbor, near the international Theosophical headquarters, limited effects of distortion are sometimes seen, the Coronado islands then seeming to float in the air.

The writer has seen an ocean liner apparently supporting a twin ship in an inverted position. This was off the Isle of Wight, England. Scoresby, the famous Arctic navigator, discovered his father's ship, of which he was in search, by seeing its inverted image above the horizon. The ship was several leagues beyond the limit of direct vision. Not long before the Franco-German war (in December, 1869) a perfect representation of the city of Paris was seen, inverted in the sky, above the river Seine. These are easily explained examples of simple refraction combined with

## Manifest Reflections of Real Objects

reflection. The *Fata Morgana* of the Straits of Messina and some desert mirages of buildings seem to belong to the distortion type.

In the cases mentioned the image seen appears to be no nearer than the real object from which the rays of light actually come. The image of the palm-tree or the ship is merely

raised or reversed, the spurious lake is the reflection of the sky, the castles appear at the same distance as the glacier which creates them. Beautiful and wonderful as these illusions are, their causes are readily comprehensible, and, in fact, some of them can be artificially produced. Thus far the text-books deserve our confidence.

But there are other phenomena classed under the name of mirage for which it is not easy to find explanations; and here the text-books fail us.

Such are the apparitions of objects so far removed from the spectator that they would be invisible, or at least too small to be clearly distinguished, even if they were bodily lifted

up so that they were not concealed by the horizon. Credible witnesses testify to having seen well-defined and good-sized mirages of scenes

which were actually at such great distances that the ordinary explanations seem quite inadequate. In these cases the images were not only large enough to be well seen but they showed the strong coloring natural to close objects, the rays from which have not passed through leagues of atmosphere. What, then, are we to make of such apparitions as the mirage of a town seen on August 2nd, from several places, on the wild Connemara coast of Ireland? An eye-witness says:

The spectacle appeared on the north-west side of the Skiards—rocky islets off the mainland. The town appeared to be a small Irish seaside resort, and, in the opinion of the coastguards who viewed the sight through their telescopes, most resembled Bray. . . . The phenomenon appeared not as a shadow, but as though a real town existed on the Skiards, with all its natural and various colors distinguishable.

The *Gakway Observer* says:

Last Sunday evening a small town well studded over with houses was observable on that sea about six or seven miles westward of Ballyconnelly. . . .

Soon hundreds gathered to witness the enchanting spectacle. . . . The phantom city was visible from 3 P. M. to 6 P. M., when it gradually vanished from the view, leaving the spectators, many of whom believed that it was a small town that had come to stay, dismayed and disappointed.

Bray is a well-known seaside resort 180 miles away on the opposite coast of Ireland! M. Flammarion, in his classical work on the *Atmosphere*, mentions a similar mirage. The distance given in this case was over a thousand miles, but the details are not stated, and it must be placed in the category of "doubtful"; among such stories as that of the mirage of the city of Bristol, England, which is

alleged to have been seen from a glacier in Alaska. A photograph claimed to be of this, has been published, but the confirmatory evidence is not conclusive.

An authentic account given by General Lord Roberts in *Forty-One Years in India*, is interesting. In 1858 he was on his way to Lucknow, and he and a friend, while hunting, saw what they believed to be a body of hostile cavalry charging down upon them. The mirage—for it was an illusion—was so perfect that he writes,

We thought our last hour was come, . . . when lo! as suddenly as they had appeared, the horsemen vanished as though the ground had opened and swallowed them; there was nothing to be seen but the plain, where a second before there had been a crowd of mounted men.

Mirages are seen upon Lake Vettern in Sweden. Not long ago a scientific worker, a member of the UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY, saw a vivid mirage while making observations in the desert north of Los Angeles, Cal. The illusion was that of breaking waves, and was so lifelike that he instinctively drew back to avoid getting wet. He was about forty miles from the actual coast. Another member at Point Loma once saw a passenger enter a railway carriage at a country station as clearly as if the incident was taking place a hundred yards away. Yet the station was quite invisible in reality and was not seen again until after a journey of twelve miles.

Such mirages as the above are remarkable and hitherto unexplained, but they seem to have physical counterparts from which they originate in some mysterious way. What, however, are we to make of certain well-attested pictures in the air whose origin cannot be so easily traced, such as the oft-witnessed vision of the "Flying Dutchman" off the Cape? This mirage, or whatever it may be, was seen by a number of persons on board *H. M. S. Bacchante*, the vessel in which the present Prince of Wales and his late brother were cruising around the world. A full report is given in the published Diary of the voyage kept by the young princes. They say:

July 11. At 4 A. M. the *Flying Dutchman* crossed our bows. A strange red light as of a phantom ship all aglow, in the midst of which light the masts, spars, and sails of a brig 200 yards distant stood out in strong relief as she came up on the port bow. The look-out man on the fore-castle reported her close on the port bow, where also the officer of the watch from the bridge clearly saw her, as did also the quarter-deck midshipman, who was sent forward at once to the fore-castle; but on arriving there no vestige nor any sign whatever of any material ship was to be seen either near or right away to the horizon, the night being clear and the sea calm. Thirteen persons altogether saw her. . . . The *Tourmaline* and *Cleopatra*, who were sailing on our starboard bow, flashed to ask whether we had seen the strange red light. At 10.44 A. M. the ordinary seaman who had this morning reported the *Flying Dutchman* fell from the foretopmast cross-trees and was smashed to atoms. . . .

Other spectral ships have been reported from the British Channel, the German Ocean, and even from the New England coast.

Shortly before the eruption of Tarawera mountain in New Zealand in 1886 an apparition of a Maori canoe was seen, upon the adjoining lake, by Maoris and white people. The *Dunedin Evening Star* of June 17, 1886, gives a long account of the mirage, saying in part:

While skirting the southern shore those in the tourists' canoe distinctly saw a Maori war canoe gliding along nearly parallel to and apparently racing them. The Maoris in the tourists' canoe hailed those in the war canoe, but received no answer. . . . They said there was no war canoe in the district, and therefore this must be a phantom, indicative of evil. When the natives and the tourists returned to Wairoa they made inquiries of the oldest natives, all of whom declared that such a canoe as had been described had never been seen by them. Mr. M'Rae, who has been seventeen years in Te Wairoa, also said that he never knew a war canoe upon the waters of the Lake country. The day was beautifully clear. . . .

Similar appearances have recurred throughout human history. Here is a curious example from the Seventeenth century. Patrick Walker says, in his *Biographia Presbyteriana*, that in 1686, near Lanark in Scotland, during several afternoons in June and July, many people saw

companies of men in arms marching in order, upon the waterside, companies meeting companies, . . . and then all falling to the ground and disappearing, and other companies appearing in the same way.

Strange to say, only two-thirds of the crowd saw the phenomenon, the others, like himself, saw nothing unusual. This mirage was seen at a time when the Whigs of that part were in a great state of excitement, and Walker was a fanatic. Yet he saw nothing, which seems singular if the whole affair was merely the result of "collective hallucination on the part of the fanatics." Stranger still, a cursing cavalier, whose prejudices were opposed to the opinions of the crowd, saw everything! Walker says those who could see described

What handles the swords had, whether small or three-barred, or Highland guards, and the closing knots of the bonnets, black or blue, etc.

Theosophy teaches that Nature possesses a storehouse of latent pictures, images, so to speak, of everything that has ever occurred on earth. From this reservoir, the Astral Light, some of them are occasionally projected into temporary visibility, usually under peculiar circumstances of tension. Before science can explain the rationale of the more puzzling phenomena of mirage its exponents will have to become familiar with the marvelous properties of the Astral Light, the mirror of the Imagination of Nature, upon which she draws for her forms.

STUDENT

### Man's Mother and His Father

IN the correspondence column of a paper, a querent asks, how did men come to call the earth "Mother." To this the oracle responds by quoting the story of Lucius Junius Brutus falling to the earth and saying: "Thus do I kiss thee, O Earth, Mother of us all!"—as probably the earliest recorded instance of the use of the term.

One tries to imagine that oracle standing before his reference books and wondering un-

der what head to look for the information. Naturally he had to give the oldest instance he chanced to stumble across; he could not be expected to search the entire library. But if he had chanced to open an Egyptian history instead of a Roman he might have found mention of Isis and Mût (Mût means "Mother"), the latter adored at Thebes as Mother "Earth"; or a Greek mythology would have told him of Demeter and Gaia. We find Earth-Mothers among the ancient Americans too; but perhaps missionaries brought to them the story of Brutus!

Man is truly conceived of Earth, his Mother; but now what of his Father? Some scientists seem to think that the conception was parthenogenetic, for they would represent Man as purely Earth-born. Yet those who so particularly spoke of the Earth as man's Mother must have had an idea of a "Father." This in the Egyptian systems would be Osiris or Ra, and so with the corresponding gods in the other theogonies. These theogonic systems were created by "the earliest predecessors of the Initiates" (see *The Secret Doctrine*, vol. ii, p. 765), and were allegories having seven different meanings. In these allegories was preserved among other things the great truth of the inner Divinity of Man, and his twofold nature (celestial and terrestrial) was symbolized.

Thus our thinkers in tracing out the terrestrial lineage of Man and seeing in him the features of his Mother, are only grasping a partial truth. The question is not, Is it true? but, Is it *all* the truth?

In all the old allegories we find the union of Heaven and Earth, the visit of the Divine Spirits informing the mindless animal-man. In *Genesis* there are two allegories: one represents Jahveh as breathing on the earth and making man "a living soul" (the correct translation of the original is "animal-soul," see *Young's Concordance*); the other shows the Elohim making man in their own image. The teaching is that evolution supervised by intelligent workers produced only the form of the future man, which had to be informed with Mind, in order that man might become a fit vehicle of Divinity. This divine gift was bestowed by the "Sons of Mind" (*Mānasa-putras*), "who had gone through all this process ages upon ages before in other worlds and systems of worlds." (*Ocean of Theosophy*, p. 53.)

STUDENT

### Useless Dead Weight on Railroads

IT is pointed out that a Pullman sleeping-car carries two tons of dead weight per passenger, and the day-coach about one and a third tons. Besides the expense of fuel, etc., in carrying this enormous load, there is the wear of the road. The cost of the car itself, its up-keep, servants, etc., must be added.

They are asking how can this dead weight be reduced, and talking about new modes of construction.

Might it not be reduced by reducing many so-called luxuries and imaginary necessities? The elaborate carving is not only unnecessary but often perhaps in questionable taste, and the sumptuous upholstery is enervating; we ought to have our bodies better upholstered with nerve and muscle. Much of the resources of invention goes to satisfying artificial wants and imaginary needs.

T.

## Some Views on XXth Century Problems

### Civilization and Drudgery

THE English Registrar-General has just issued an official report on occupational mortality. But he fails to append a note to the effect that all the figures are nearly worthless. They must be so, for it is hardly possible to draw a line between the mortality necessarily resulting from an occupation and that resulting from collateral habits usually associated with it. For example the mortality of musicians and music teachers is very high. But the report itself points out that it is impossible "to escape the conviction that many of the men included in this group are sadly addicted to intemperance." Moreover, large numbers of the rank and file of music teachers are in a condition of chronic pecuniary worry.

We may hope that civilization will at last refuse to permit itself to be served by occupations, such as that of lead work, which are necessarily poisonous. Nor will occupations of pure drudgery, occupations in which the creative and fashioning faculty is not called upon, ultimately survive. The habitual use of this faculty is a necessary condition of perfect health.

And herein lies one of the causes of tuberculosis, a cause which the Congresses are missing. Whatever praises our civilization may be given, no one can call it *happy*. The frantic hunt for pleasure is due to the absence of happiness. Perhaps nine men out of ten regard their day's work as a necessary evil, the effects of which have to be corrected or dissipated in the few hours remaining. It was over a ledger, or fastening heads on pins, or walking a shop floor—nothing that could excite interest, nothing that could call out the creative faculty. A hobby is simply the result of the demand of the creative faculty for something to do; for this mental power gives life to its owner through every minute of its use. No small part of the intemperance and vice attending certain occupations is due to the ignorant attempt to get in that way an interest into the passing hours which would healthily and normally be sought in creative work. But the man does not know what he lacks, what is the matter with his life. Novel reading rests on the same basis. Our ways of education do not bring to the child a consciousness of its creative power which is nevertheless pressing for satisfaction. He merely knows a lot of things. He cannot *do* a lot, especially cannot do that one which is *his*, does not even know which *is* his. So, later, he must fill the empty part of his life with something. The secret of happiness is in the creation of something, backed by the knowledge of the desirability of that something.

A machine-made article may be exactly as good as, or better than one handmade; but if the two are labelled in the shop window which shall we select? We instinctively like the idea of the worker working out his own design. In the medieval craft-guilds every worker was expected to use his creative mind to whatever extent he could.

The teacher who has to force a crowd of children up to a certain "standard," is com-

pulsorily a machine and turns out machines. He is spending his life, and his evening weariness is not altogether recovered from; it is gradually cumulative. The teacher who may interest himself, or herself, in the children, who loves them and the work, and who may give time to them as individuals, is using the creative power, and the daily weariness is more than self-curative.

Some relative drudgery there may of course always have to be; but it will be included in the larger field of a creative purpose and be lit and relieved by that. STUDENT

### The Spiritual Nucleus

DR. MINOT'S lectures on Old Age, now published as a book, will act as a stimulant or depressant to their readers according to their type. Tell two men that they are utter failures, and one of them will sit down in hypnotized hopelessness; the other will be stimulated to redeeming effort.

The study is mainly microscopico-biological, and then the results—on the inverted principle *as below so above*—are taken upward to man as a thinker.

When a cell is young and vigorous, its nucleus is large in proportion to the cell body; for the nucleus is the reservoir and the director of force. As the cell gets on into middle life, its body becomes as it were obese, bulky at the expense of the nucleus. The latter becomes smaller, less initiative, less springy. Still later, the nucleus has almost retired from business altogether, initiates nothing; the cell body can only do, and with increasing difficulty, what it has in its earlier and inspired days learned to do.

By analogy, man as a whole is considered somewhat as a cell. To complete it, the nucleus would be his will, imagination and energy, the creative kind of energy that can push out in new directions, not the sort that can merely pulse along already opened paths. The cell body is trained power, habit, the accustomed scope.

Queen Victoria set herself to learn Hindustani when well into old age. This particular move may or may not have been very wise; but there was very much wisdom in the view of life from which it arose. She did not believe death to be finality, but a gateway through which she passed with the whole of her mental and spiritual power.

One reader of Dr. Minot's book, nearing forty, will take it as the last word of omniscient sciences that he has reached his culmination; his "nucleus" has now lost the power to initiate anything; he can henceforth only do and be what he can now do and now is. His character is fixed, with all its weaknesses and faults; his mind can acquire no new knowledge.

The other, perhaps long passed forty, will say: "Behold, I am myself the nucleus; there may be limits to my possibilities mental and spiritual; but it is pretty certain that I shall not reach them, shall not even get in sight of them. The field is clear and wide for anything I like to do."

He has the key of the situation in asserting

himself to be the "nucleus." The grower is the man who believes he can grow. He grasps his consciousness and refuses to let his brain set into incapacity. He figures himself as his brain's light, and much more. He finds that the power to produce new powers, itself grows with use. In refusing to let the light of consciousness burn low and turn its futile rays backward upon old memories, which is senility, he is able to advance to the last. As nature slowly wins and the brain fibers stiffen with years, he finds that he can begin to replace that activity of thought which depends upon brain, with another and higher. Finally, consciousness thus trained by an unflinching purpose, he perceives with absolute clearness that death is but a gateway through which he passes with his stored power. That indeed *can* be learned much earlier and with the same certainty; but few do it then or later.

And at his next birth the man comes upon earth with all the power, and with all the power to generate power, which he had acquired before. STUDENT

### Man-Breeding

DR. KELLER of Yale has been making a number of excellent criticisms upon the recent attempts to formulate some scheme of man-breeding, preparatory to further attempts to get it realized in legal enactment. The schemes may vary within very wide limits, some of the more extreme proposals having an actually insane touch about them. Others merely suggest that the State should require normal health before licensing marriage.

But there is hardly any need to stand on the defensive. The difficulties would be too enormous. As yet, at any rate, we can let our weapons lie quiet.

There is a science of man-breeding, if one must use the stud phrase; but the eugenicists have not yet touched its fringe. For it depends upon facts they do not recognize.

One of the actors at work upon the human-animal child to be born, is its own soul, the possessor of powers and aptitudes the parents cannot know. It will do its part if they do theirs. Physically the child tends to be the registration of the mental atmosphere of the parents. If that is pure, sweet, and even throughout; and if the parents hold in mind, throughout, that in preserving it they are co-operating with the child's soul—the child, when born, will be sound and healthy beyond any apparent warrant of the laws of heredity.

And then if, throughout its early years, the parents will train it to know for itself that in its struggle the two diverse elements, that of the selfish and animal, and that of the personal divine in which lie its true powers and special aptitudes—it will grow up into more than they ever dared to hope of it, a child of a new race.

A generation or two of this sort of thing, and the ideals of the eugenicists would look very pale and inadequate. For these children would have and recognize in their own consciousness, and when the time came, obey, the highest laws of marriage. STUDENT

## TEMPLE OF THE SACRED TOOTH, KANDY

### Circulation of Blood Known to Ancients

THE theory that such ancient peoples as the Egyptians, Hindûs, and Chaldaeans were unacquainted with the circulation of the blood is incredible. When we have such abundant evidence of their acuteness of faculty, their range and minuteness of observation, their industry and skill, their mental vigor, and the enormous periods of time throughout which their acquirements were pursued and accumulated—the idea that a fact whose knowledge depends on simple observation could have escaped their notice becomes preposterous. On the other hand, we have only to study the history of Europe to realize how recently and partially it has emerged from the darkness following the dispersion of the Greco-Roman civilization, and how rude and barbarous our ancestors were compared with some of these ancient peoples.

A doctor is, however, good enough to say that "Harvey was almost anticipated 6,000 years ago by the priest-doctors of Egypt"; and that as far back as 4000 B.C. Egypt had works on anatomy and medicine, and one brilliant genius, I-em-hotep, priest of Ra, to whom temples and hospitals were raised. The priests were

"probably the first of mankind to acquire a rudimentary knowledge of the movement of the blood. Their papyri contain intelligent references to the heart, the blood-vessels, and the pulse. Of the heart, in particular, they knew much, and their writings refer to its enlargement, fatty degeneration, displacement, palpitation, and pericardial effusion. One remarkable passage of these old-world inquiries speaks of distension of the heart and shortness of breath as occurring because the blood was stagnated and does not circulate properly."

"Blood existed, and it behaved as it does at present in the first man born from woman," says H. P. Blavatsky (*The Secret Doctrine*, I, 559). One would like to know what the Chinese have to say on the question.

And while one cannot suppose for a moment that any anatomical fact of importance in medicine escaped the knowledge of the brainy and energetic physicians of these great races, they had also knowledge which we do not yet possess. And why not? How long is it since we persecuted Harvey? Not so long as many of the gaps which our history books leave between two of their kings. We are still in the stage of recovering ancient knowledge, at school with antiquity, getting science and algebra from Arabia, literature from Greece and Rome, religion from India. The Hindû books also show the existence of a knowledge of physiology based on an acquaintance with the anatomy of the finer vehicles of life that lie within the outer physical envelope; and though such knowledge is likely to be of more harm than good to people at our stage of civilization, it may be referred to for the purpose of the present argument. The knowledge of the circulation of the vital currents, and how to regulate it by the will and by other means, is superior to the mere knowledge of physical anatomy, though of course the latter is needed too. But the danger of dabbling in such a subject, on the strength of a superficial acquaintance derived from faulty translations, and without having gone through the necessary preliminary training of the moral faculties and physical health, is so great that it is fortunate that this danger is mitigated by our prejudices. Nevertheless we get an idea of the knowledge that is in store for us when we have become, as a race, worthier and safer custodians of it. The remark that the

Egyptian priests were "probably the first of mankind, etc.," means nothing more than that our present historical knowledge only goes that far back. It is also a somewhat crude conception—that of the circulation of the blood existing as a fact in nature before anyone knew of it, and then man coming along and discovering it—one of the anomalies that result from trying to deduce man's mind from that which is posterior to it. ### Temple of the Sacred Tooth, Kandy

HERE is enshrined the greatly venerated Dalada relic, or the Sacred Tooth. The King of Kalinga (now Orissa, in Bengal), being attacked by the Brâhmans, sent it for safety to Ceylon in charge of his son and daughter, the daughter bearing the relic concealed in her hair. This was in the early part of the Third century A.D., and since then the relic, according to native chronicles and traditions, has had many wonderful escapes from destruction.

Before entering the small sanctuary where the relic is now carefully guarded, the visitor must take off his shoes. The tooth is occasionally shown to royal and other very distinguished visitors, but the ordinary tourist only sees, behind strong metal bars, the outermost of seven handsome bejewelled caskets, six of pure gold, which enclose it. Even for this privilege a gratuity is demanded by the attendant priests, who, it is to be feared, do not feel themselves bound by Gautama's prohibition against their receiving money. Perhaps they have not strayed farther from the Founder's teachings than many Christian ministers have wandered from the commandments of Jesus; and the gratuity of the Buddhist priest is not morally worse than the pious robbery which occurs at some Church bazaars. # ✻ The Trend of Twentieth Century Science ✻

## The Structure of the Atom

EVER since the electrons were hypothesized as little centers which by their groupings constitute the atoms, as these atoms again by their groupings constitute the molecules, attempts have been made to find out as much of the nature of the first order of groups as we know of the second. And some little progress has been made. At any rate there are plausible theories.

The usual theory makes the atom somewhat resemble a solar system. It has a fixed nucleus corresponding with the sun and consisting of a definite number of electrons or of a multiple of that number. Around this are subsidiary groups corresponding with the planets and consisting of smaller but still definite numbers of electrons.

Consider, for instance, the first line of Mendeleeff's table, the line of the alkaline metals lithium, sodium, potassium, copper, rubidium, silver, caesium, and gold. Their weights correspond pretty closely with the hypothesis that their "sun" contains 16 electrons, or a multiple of that; and the "planets" 7 electrons or a multiple of that, or that if single electrons, there are 7, 14, or 21 of them.

The first, lithium, is to be provisionally pictured as a planet only; its weight is 7. The second, sodium, is a sun, 16, with one planet, 7, making 23; which is the known atomic weight of sodium. The third, potassium, is a double sun, 32, with one planet, 7, making 39, which is potassium's weight. The fourth, copper, is a triple sun, 48, with two planets, 14, total 62; copper's actual weight is 63. The fifth, rubidium, is a quadruple sun, 64, with three planets, 21, making 85; which is the weight of rubidium.

The next column works out in the same way, the sun being 16 and its multiples, and the planets this time 8.

In the third column the sun is still 16 but the planets are 11. Thus boron is 11, a planet with no sun. Aluminium, 27, contains a sun of 16 and one planet, 11. Scandium has a double sun, 32, and one planet, making 43. Its observed weight is 44. Gallium has a triple sun, 48, and two planets, 22, making 70, which is the observed weight.

The theory will not exactly work out. But it works out well enough to show already that the atom is no more a chaos than the molecule or the solar system. We can get that much from it without binding ourselves to the provisional figures and pictures. H.

## The Canals of Mars

DR. ALFRED RUSSEL WALLACE has advanced a theory to explain the existence of the "canals" of Mars. Professor Lowell will doubtless be presently upon the war-path, for the Wallace theory is that these lines are not canals but natural cracks.

Dr. Wallace uses the planetesimal hypothesis of Chamberlain, according to which the planets arise from the aggregation of masses of matter larger than meteorites, "planetesimals." The aggregation generally produces

heat; but according to the theory the planetesimals that made up Mars arrived at the scene of action as it were one by one, at any rate so slowly that the heat was dissipated as fast as it was generated. Finally a cold planet thus resulted. But the new Mars suddenly ran into a crowd of planetesimals and annexed them all at once, adding them to its surface which thus became extremely hot. But this hot rind was quickly chilled by the cold mass beneath, cracked all over, and thus generated the "canals."

Granting the existence of these lines, does it follow that they are on the surface at all, or even physical? If the photograph of a child who in a few days will have measles be examined, it will look spotty, the photograph spots corresponding with those that will subsequently appear. But to the eye the child's face will seem quite natural. Somewhat similarly the Martian canals may be beneath the surface and yet, perhaps, be telescopically visible.

Moreover they may be lines corresponding with the distribution of some force, magnetic, electric, or what not, known or not known on earth. It is quite possible that if, running through the earth's crust, there were lines of extra radio-activity, these might be visible from a great distance. We must learn a good deal more in many directions before we can rationally assert that Mars is a dying planet, that his lines are water canals, and that they represent the efforts of a beleaguered people to save themselves from impending water famine!!

STUDENT

## What Becomes of Them?

CAREFUL experiments officially made in London have shown that stored water gradually gets rid of all the germs it may have contained. Samples of it were infected with vast numbers of typhoid bacilli and examined every few days. The germs grew fewer and fewer and in five weeks not a trace of them remained. Dr. Houston, who did the work, does not think however that it would be wise for cities to rely entirely upon this method. He recommends a combination of long storage with rapid filtration. The *Scientific American*, in view of the difficulty of maintaining a large enough bulk of water in any reservoir systems that cities now possess, suggests duplicates. One set might be undisturbed for the necessary weeks, while the city was drawing at the other.

What becomes of the germs? No traces remain. When they have consumed whatever they can get out of the water, they do not merely die or go into the resting spore-form, but vanish altogether. Doubtless they oxidize. But so far as we know — and there have been many experiments to settle the point — oxidation of organic matter never occurs in the absence of causative forms of life. Even coal, even pure inorganic carbon, oxidizes for this reason and probably for this reason only, the process being mediated by germ life.

There are doubtless germs which prey on germs, perhaps on living ones, almost certain-

ly on dead ones. And this second order must be far beyond microscopic visibility in size and perhaps in hyalinity of texture. If analogy goes for anything, there must be tiers of life, one behind (or within) the other; how far back (or in) we cannot guess. The line between plant and animal is very clear and no experimenter could tempt a member of one kingdom to come across to the other; but at the very bottom of the scale there are organisms which are *on* the line. The line between organic and inorganic is clear, and no experimenter *except with the help of something already living* can tempt the inorganic into the organic. But at the bottom of that scale there may be life which is *on* the separative line.

STUDENT

## The Senses of Plants

TO the admitted sense of plants, touch, position-sense, and sight, are now to be added smell and taste. The demonstration of these latter we owe to Professor Garner, who seems to have come upon them by accident.

He had planted a young vine in a box, giving it sufficiently good soil and something to climb up. It seemed, he says, "contented" and thrifty. Just as it was beginning to climb he placed alongside of its box, about nine inches away, another containing rich compost designed for some tomato seedlings to be later planted out. Each box was regularly watered.

After a little while the stem of the vine, on the side toward the other box, began to develop a little spur, followed by others, none of them, however, bearing leaves. The tomato seedlings being removed, their box was left, to watch results. The spurs lengthened and finally left no doubt of their direction or nature. They were roots and were making for the compost box! In due time, having become from ten to thirteen inches in length, they reached it, dipped into the soil and established themselves in regular business.

This was so remarkable that Professor Garner set himself to test the matter. A large box sixteen inches square was taken, filled with fairly good soil, and planted with a vine in one extreme corner. In the diagonally opposite corner a small tin box was buried, filled with rich compost. It was closely lidded, bored with five small holes and these covered with two layers of cloth.

In due time this box was examined. The vine rootlets had crossed the diagonal. Into the five holes they had run fine filaments through the cloth. Other filaments ran up between the lid and the sides; and these, once in the compost, had thickly meshed themselves all through it.

This was obviously smell. Some other experiments, made in water, in the same way sufficiently establish the existence of the sense of taste.

The other sense is that of hearing. It is quite possibly entirely absent. The life of the plant perhaps no more requires it than we stand in need of chlorophyll.

## Vanadium Steel and its Suggestions

THE increasing use of vanadium steel for locomotive frames and for bridges, has called attention to the value of the rarer elements in commerce. Looked upon as little more than curiosities in many cases until the opening of the new century, an interesting impetus is given to their investigation by the leavening power some of them possess with regard to the commoner metals. Thus the addition of very minute quantities of vanadium to steel doubles the breaking strength of the metal and in some cases almost trebles it. Without going into the pros and cons of this particular process, and without slighting the purely mechanical improvement in the metal by such additions, there appears to be reason to suppose a "catalytic" action, in itself quite unexplainable, or possibly other actions not even named to science.

As in the case of medicines too minute in quantity to exert a purely mechanical action on the human body, but which influence all parts of it in a tremendous degree, there would seem to be degrees in natural substances analogous to those of more highly organized orders of being. None will deny that the mental activity and work of man is in degree far above that of animals, just as that of the animal is superior to the life of the plant—and what is not so easily to be acknowledged in spite of its logical necessity, there is an order of human development compared with which that of the average European or American is as crude as the intelligence of the Hottentot is in comparison with that of the American. The divine nature runs through all, but in differing degree of activity—to use the terms of non-chemical philosophy. Upon this depends the universal truth of ana-

HORNVIKEN HARBOR, NORTH CAPE, NORWAY

logy, and following this line of investigation there should be scope for some interesting observations of the action of minute proportions of chemical bodies upon masses of more coarsely constituted substances. The subjects of ferments, of the coloring of gems, of alkaloid toxicology, of periodic chemical law, might be enriched by such research, among orthodox sciences. On planes where the probe and balance and test tube have no entrée and where science only dares to tread at the risk of its reputation, even more vital analogies suggest themselves, more akin to the Eastern philosophy than to materialistic lines of thought. Of no particular value to the possessors of a cut-and-dried religion and ready-made belief, yet to some they give much food for

thought in the questions of the expression of divine will in the action of chemical substances; actions so true to law that caprice-governed minds cannot grasp the possibility of such perfect impersonality of action, or resignation and renunciation of action, to use a well-known Eastern phrase. Another expressive phrase refers to the attainment of the "diamond-soul," suggesting the ultimate refinement of the human organism to the point where all the powers of the universe may be focused through a minute medium. It is in the light of such analogy that the basis of real human progress in ethics and not in the search for strange "powers" is to be perceived, the need for self-purification, the living the life before the doctrine can be known.

The period of synthetic science inaugurated by Madame Blavatsky some 30 years ago is fast bringing the world to a point where it is impossible to draw dividing lines between the spheres of any of the departments of human knowledge or study; and it is found that the statement of universal truths in the terms of any one science in no way interferes with their truth when expressed in the terms of any other, but rather confirms their universality of application.

In one of her great works H. P. Blavatsky draws a picture of the young student in the temples symbolically recording his studies and bring the finished work to the hierophant to test for continuity of truth in all seven departments of instruction before approving its acceptance. Our sciences of today are fast approaching the same point and the more we discover the more exactly do we find that all fits in with wonderful synthetic simplicity into the universal plan of the Wisdom-Religion of Antiquity, the Theosophy of the ages. The search for general principles that govern all manifestation is a fascinating occupation; and it was the possession of such a master-key that made ancient science what it was. P. A. M.

## OF VIRTUE

Dante Gabriel Rossetti

THE flower of Virtue is the heart's content;  
 And fame is Virtue's fruit that she doth bear;  
 And Virtue's vase is fair without and fair  
 Within; and Virtue's mirror brooks no taint;  
 And Virtue by her names is sage and saint;  
 And Virtue hath a steadfast front and clear;  
 And Love is Virtue's constant minister;  
 And Virtue's gift of gifts is pure descent.  
 And Virtue dwells with Knowledge, and therein  
 Her cherished home of rest is real love;  
 And Virtue's strength is in a suffering will;  
 And Virtue's work is life exempt from sin,  
 With arms that aid; and in the sum hereof,  
 All Virtue is to render good for ill.

## Good Manners

ONE of the great Teachers concerned himself mainly with this subject, and students of Theosophy must see how worthy it is of such careful attention. Some may sneer at etiquette and conventionality, noting that the canons of politeness vary at all times and with every people; but the truth is that there is a deep soul-ideal underlying all these, which we cannot afford to ignore.

When we come upon this earth we are all yoked up with a wild beast; dwell shut up in one cabin (the body) with him, and have no duty more pressing than to assert our superiority. For it is a rampant and wayward creature, this human animal, and needs to be curbed, bitted, shackled, tamed limb by limb till fit companion for us. Let him alone and he will be pig, hippopotamus, tiger; he will go crashing and slouching through life like a riverhorse through the reeds. Can the human soul tolerate such a body-fellow? Remember that the soul's own place is most regal; no courts are patterned on such stately grandeur.

Will it do then, to say—*My interests are in music, philosophy, the higher things of life; I cannot concern myself with the goings on of this personality?* Or to leave it unsaid, and the brute to range as it pleases (short, of course, of coming to moral harm)? To be unaware that it is there and ramping, as no doubt there are many who are unaware? This is to go unincarnate, to leave your body tenantless, and overgrown with weeds. How shall the soul do his work well, if his house is at the mercy of the untamed?

Wherever the soul is at work, wherever the Higher Law is unquestioned, you have grace; that is to say rhythm, majesty, virile beauty. So the crystals take their form and precision and order; the rhythm of life has entered into matter and set it vibrating, shaken an atom here and an atom there, arranging them into stars and all manner of geometrical figures. So the flowers are each a kind of poem; one petal, as you may say, rhyming with another. So too are the dances of the suns and planets even and courteous, each in his own orbit

and strictly considerate of the orbits of all others. Once let the soul have full control of the body, and the atoms of the body ringing with the sense of his control, and the man moves bodily like a star, possessing himself; not, as perhaps hitherto, "like a bull in a china-shop." All the business of slamming doors, slouching and tramping out loud through a room where others may be studying or in conversation, guffawing at the top of the voice—indeed, letting the hippopotamus flop and wallow through life without restraint or disguise—all this vanishes, and we have the carriage and conduct of a gentleman in its place.

But, you will say, ought we not to cultivate that which is within, leaving the external to follow when the lead is given it? Is it not the soul which matters, and may not the outward seeming be left to take care of itself? To the first part of these questions we answer *Yes indeed*, to the second, *Beware of false glosses!* You treat the soul as though it were some outside power, that would do the work for you without your interference. That is not the plan. You yourself are the soul, as well as that part of yourself which has not yet come into manifestation, which is godlike in itself, but not yet potent in your affairs. See the truth in this matter, and go forward towards it; club you, of your own present knowledge and volition, that loud and loutish animal of yours into quietness and grace, and then talk about the soul. You will know more of your subject then, be sure of that; because you will be more of it. The very highest and most courtly standard of behavior that ever was in use upon the earth, is not too exacting for the man who believes in man's divinity. The whole tone of life needs to be lifted all round—does the sunlight shine best through clear water or through mud? Do not pretend that coarseness and disorder are sought out by the soul as a site for its manifestation. It is true that the soul-life may have ebbed away, leaving a certain froth and jetsam of etiquette to be dried up by the sun and winds of reality, as all things are that have become irretrievably shams. So it was when the spiritual essence of chivalry departed, and feudal manners remained, a starched make-believe, a skin puffed out with wind, from which all remnant of the living creature had long been purged. To be horribly punished in France, at the Revolution time, when those whom a perverted nobility had so trampled upon for centuries rose and trampled it in their turn. Yet we must remember that there was a grand failure there; dark powers had found an entrance, and worked ruin on a venture that might have been all for human light and advancement. Supposing France had been saved then, standing forth untrammelled as the pure light-bringer of Europe and the world, as certain of her leaders had intended. Her aristocracy would have played its part too, in all probability; that quality of *noblesse*, that had come to look so despicable in the company of all the vices—how would it have appeared if one deep and honest purpose had been breast-fellow with it? How had it appeared of old in the Chevalier Bayard; how, in those later times, in Lafayette? It would have proved at least as good a tool as another for building the temple of regenerated man. It is a magnetic quality; fire and force from the inward

world can thrill and travel along it. Because this or that great man has worn a rough exterior, as you have heard it reported (you could form no first-hand judgment on the matter yourself), do not excuse your own carelessness and ill-grace. It may have been the very crucifixion of his soul, hindering him from his best work and always lamented and striven against; or he may have had some excellent reason for it, seen with the seer's eye in the times and circumstances about him. You will do well on the other hand, to look most carefully into yourself and find out what your own motive for uncouthness may be.

To assert your independence, your equality with others? As often as not, we believe. How contemptible an attitude! We others were not suspecting you; we never questioned your standing, until you yourself flaunted its inferiority thus. Why not leave the whole matter alone, as you would if you were satisfied that all was well with you in reality, and that there was no occasion for you to bluff? Do you win respect by showing none? Your motive for it all is as clear as daylight. You might as well go forth on to the street corners and shout out: *I am a miserable creature; I am far behind in the race; you are all my betters, indeed you are!* Everybody reads just that from your blundering attempts at equality. Think now, the question of equality was not raised at all until you yourself raised it. We saw your fear that we should not recognize it, and that you were driven to set up some kind of fetish wherewith to convince yourself and us that we were no better than you are. We should have acknowledged it fast enough had it been true; even if it had not we should hardly have troubled. Now you have proclaimed its falsity; for when a man makes so great a show, it is only to deceive his neighbors.

Or perhaps it all arises from laziness. You cannot bother to teach your body to be as human as a body may; to cover up, or rather to transmute, its ugly animality as well as possible. You cannot trouble to consider others—is that it? Your convenience and immediate needs, they are the things you are set here in the world to meet; meet them you will at every moment, and let the others do the same. A pretty mess this poor humanity of ours would fall into, if there were not some modification of this doctrine in being amongst us! Truth to tell, it is just the old "insanity of the age" at work in you after all. All your fine despising of the merely external has come down to pure selfishness. Put it how you will, ill manners are merely the expression of a warped and selfish nature. Set to work to reform them, with anything like a decent motive, and you are ploughing up that parched poverty within. The soil of you is, so to say, getting nitrogenated and opened out for the rain and dew, and shall bear sweet flowers by-and-bye.

"Assume a virtue if you have it not," is excellent advice, except to a hypocrite. True, the cultivated, watered soil will grow worse weeds, as well as better blossoms, than the desert; but you are there to grow flowers, are you not, and can trust yourself to use the hoe in season? Your will is towards the right; your desire, to help and serve? Up with the weeds then, plough the land; look to your outward bearing and courtesy. Q. R.

## REST

S. F.

Inscribed to the Memory of a Comrade

ONLY a rest for the clear, strong brain—  
And rest for the brave, true heart—  
Only a pause for the busy hands  
That have always done their part.

The willing feet, for a little space,  
Are stayed on the brink of life—  
For a respite brief—a needed rest  
From the daily toil and strife.

One who was ever found at his post  
If weather was foul or fine—  
Soldier who answered the bugle call  
And steadily marched in line.

While weary comrades around him slept  
A sentry he stood on guard,  
And ever ready to lend a hand  
When the way was rough and hard.

In silence he took up each duty—  
The sternest that life might bring—  
And through patiently doing the right  
Grew nobler than prince or king.

The burden has fallen, Companion;  
Rest, Comrade; the loyal and true;  
From slumber thou soon shalt awaken  
Work for the Soul to renew.

Then rest a brief moment from labor—  
Inner eyes turned to the Light—  
We say not goodbye to thee, Brother,  
But only a quiet goodnight.

## THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** Is it possible by sincere striving to correct one's mistakes and faults and to repress entirely the promptings of the lower nature, even though these come again and again? Or in order to do this must one be taught Theosophy from childhood?

**Answer** Is it possible to correct one's mistakes and conquer the lower nature? Let us suppose it were not possible. What answer would we then give? What hope would there be in life, what possibility of progress and ultimate attainment? If it were not possible, what would the injunctions of all the great Teachers and Sages be but a mockery? Is not the answer contained in the very urge that we feel to make the attempt again and again? And if we fail apparently, again and again, can we not almost in every case see why we failed and that there was a point when if we had persevered in our efforts we might have achieved a victory instead of consenting to failure?

The advice of one of the Chinese Sages is "to effect difficult things while they are easy, to manage great things in their beginnings." It may at first be thought that this applies only to the case of a child and not to failings and habits which are the result of the growth of years. It may be said that it is not the case of a tender pliable sapling that may be bent in any direction, but a full grown twisted and gnarled tree that we ask about. What can be done in the case of a confirmed habit of the lower nature which has grown strong and whose promptings recur again and again? This is indeed a question that needs answer, and yet answer there is, and the advice of the Chinese Sage applies here as well, though perhaps in a different degree. For anyone by a little observation may learn that the recurrence of habits both good and bad comes in cycles, and that periodically there are times when the

force of a habit is weak and others when it is strong. If therefore at the time when a habit, which it is desired to conquer, is weak, the force and energy of the character and the will be given to building up the higher nature, creating some habit of virtue and helpfulness, by just so much will you gain strength to fight against the evil when it again assails you. Thus to follow the Sage's advice, one should not wait to fight the evil when it assails in full force, but fight it when its attack is feeblest or when for a time it has ceased. "Effect difficult things while they are easy." Yet to gain the victory one must not rest satisfied with this or succumb when the lower forces make their onslaught; for this would be to build up but to destroy again. Surely, it need hardly be said that then one must strive more than ever to hold one's ground. But how may one do this, are there no helps? Yes, again and again has it been taught that just as in physical nature no two things can occupy the same space at the same time, so in our thoughts and lives. And here is the advice given by William Q. Judge: "Persevere, and little by little new ideals and new thought forms will drive out of you the old ones; this is the eternal process."

This is but an expression of the eternal Karmic law, that seeds sown will bring their harvest, and new ideals and new thought-forms—for every thought involves a form whose permanency depends on the recurrence and intensity of the thought—will gradually weave themselves into the fabric of the character so that at last the old thought forms, not being continually strengthened, shall gradually fade away.

One word should be said in regard to "repression." It is not *repression* that we should seek to exercise, but true self-control and self-conquest. The act of repression is more that of hiding, concealing, not permitting the manifestation of, but it does not necessarily carry with it control or conquest. In the *Bhagavad Gītā* reference is made to "the false pietist of bewildered soul" as "he who remains inert, restraining the senses and organs, yet pondering with his heart upon objects of sense." Mere repression is a form of hypocrisy, and so long as only repression is exercised, so long as the restraining power is only that of public opinion or convention or fear of exposure, so long in fact as the evil is permitted in the mind, will it be inevitable that sooner or later it will show itself in act and perhaps cause the greater shame.

Self-conquest, through which alone we gain power to ascend the heights, is indeed possible, and its achievement is one of the purposes of our being here. It is possible because of the Divinity that is in the heart of every man, and through its power, if we will accept its guidance, though we have descended into the very depths of hell, we may rise again to the sunlit heights of purity eternal.

To have the inestimable privilege of the teachings of Theosophy in childhood is a boon beyond power of description, and what nobler work for the race can there be than to provide a system of education that shall instil these highest truths into the minds of the young? But there is the teaching of Reincarnation, and through it we know that the efforts of our present life, though imperfect and falling short of final victory, are not lost; and that the

strength of conquest, however little it may be, that we gain in this life, will be ours again in greater measure when we return to rebirth. And through our efforts now, who can say it may not be our lot, when we come back again, to receive in earliest childhood that teaching and guidance that shall lead in coming incarnations to the crowning victory of the soul? And this is the hope that Theosophy gives in its teaching of Reincarnation. STUDENT

**Answer II.** To find the answer to this we need to remember what the truth is about the nature of man. For it might be shown by instance after instance that to overcome is difficult (as indeed it surely is); one might multiply example after example of those who have tried and failed, of those who have tried and have not yet succeeded. Are there, then, no examples ever of men who have won success? No need to instance them; we know there have been many such conquerors. And if so, do not drag in heredity, education, environment, as counter-arguments in particular cases, or as complete obstacles. It must be ideally possible for *any* man to win through; it is really possible for any man who has the right motive, which is perfect altruism and unbounded faith in his own higher nature and power to win.

These two conditions given smack a little of dogmatism, you say; why should a man need to have faith, or what difference can a motive make to the exercise of will-power? There is good reason for giving them, however. You have entered into a battle with your lower nature, and another name for the lower nature is selfishness. How can you, in any practical manner, fight selfishness for its own sake? It is a case of casting out devils in the name of Beelzebub—a potentate who is far too wise and too much alive to expel his own beloved subjects!

Then too, remember that there is no such thing as separateness; no such thing as a hard or water-tight line in all the realms of nature; our brains love to think in those terms, but they do not really exist; your brain-mind is the most marvelous setter-up of non-existences. You say "your" lower nature, meaning that part of you which is susceptible to the currents of evil in the world's thought; you have challenged it to warfare and it has the intention of holding out as long as supplies last; supplies are these currents of evil; see then what vast resources it has to draw on. Can the energy stored up in your personality alone suffice to meet that?

But the soul in you also, the altruistic or compassionate side, is universal, and in alliance with the whole soul-force of the universe. Win the aid of that alliance and you will not fail, because it is divine, of infinite strength, the product of countless trillions of ages of evolution; whereas the other is merely chaotic, demoniacal, counter-evolutionary. If you are fighting for the sake of humankind, recognizing that every dark thing in your heart—even if, so far as you are aware, unexpressed in any word or action—is still a kind of sore or stumbling-block for the whole world and therefore to be expelled: if one has this attitude, and that faith in his divinity which enables it to be ever present at his aid, he is bound to succeed. But—blessed is he that has received or is receiving the Rāja Yoga education. P. K.

REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West

## Eyes and Imagination

WE have two modes of vision, we human beings; and use neither of them as we might. The first is the eyes, through which we are for the most part content to leave unnoticed the panoramas of exquisiteness and all the riot of color and glory which, shall we say, the gods provide for us every day. For to say *Nature* is a kind of truckling to an old convention brought into vogue to hide our ignorance and lack of faith: when we do not understand a thing we call it *nature*, and the word has come to have a hackneyed and unvital sound. We might let our eyes play over the sea, and without any idea but that great glinting blueness, be lifted up, be brought clean into the joy of life and near to our own secret godhood. For look you now, the thing so ripples and gleams, the blue runs into purple with such joy and bewildering multi-motion; and it all passes into the dimness on the edge of the world, on the edge of the sky, till you cannot tell where the one begins and the other ends, nor where the glowing islands may be hidden.

We go about our daily duties and pleasures so absorbed in the persistent unchecked clamor of our lesser minds, that we rarely trouble to look out honestly through our eyes, and go uninformed of a million beauties. Such and such a sunset was red and yellow, we say; heedless of the myriads of flaming jewels—topazes, amethysts, rubies,—flung abroad over the skies: it was all *red and yellow* to us, we let it go at that and were not greatly interested. What were our eyes about? Windows untenanted they were; some personal affair within was keeping the tenant buzzing to and fro futilely. We are not divorced from natural living by modern civilization, nor by the clothes we wear, nor by machinery; but by those wretched cacklers that we call our minds. Some one is antipathetic to us; we meet him, and off goes the cackling simpleton within, with jabbered repetition of the tag-rag and bobtail of memories; how the antipathetic one behaved to us at such a time, how we replied, the next step and the next; how we ought to have replied, and so on. You may have the most excellent eyes in the world; but until the mind is made quiet, it is only a purblind looker-out who is standing behind them.

And there is another and diviner mode of vision, which is vision through the higher imagination. By this means we might interpret all that the eyes report to us, perceiving the spiritual unity and meanings. Herein lies the value or power of the arts, particularly of poetry, for the poet ought to interpret, not merely report. We ought to be so at one with our great Universe, that a sunset should be a spiritual fact and epoch for us; lighting up firmaments within, as well as that without, our being; and causing all our consciousness to be flooded with flames and silver and mystery. In reality all things, and the mountains and seas and flowers, and the opening and closing of that blue, rose, and gold-rimmed blossom, day, and the silent mystery of the stars, are the moods of our great Mother (we must call her *Nature*), and we might have such moods too, being *Born of her essence, flame of her Flame,*

## MEMBERSHIP

In the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

and should have them, were that little noise-maker within us reduced to silence and servitude. No description of natural beauty, even if it were perfect, is of equal value with a statement that conveys the reality of what domains and potencies and vast glimmering vistas there are within ourselves. The faith and glory of heroes, the dawn-lit imagining of poets, might be the commonplace pabulum of our mental being, and they shall be, too, some day—just as those amethystine, ruby-rich and opalescent islands of the sunset, that immense noontide abode of blueness, and all those seas of apricot light above the mountains at dawn, are the daily and commonplace moods of the Mighty Mother. M.

## Sleeping and Dreaming

Is it true that from its prison  
In swift flight our spirit slips,  
When sweet sleep our drooping eyelids  
With his rosy finger tips?

Is it true our soul at midnight,  
Borne on wings of breezes fleet,  
Mounts into the spaceless ether,  
There with other souls to meet?

Is it true our naked spirit,  
With no earthly fetters fraught,  
For a while goes freely roaming  
In the silent world of thought?

That it keeps the stain of passions—  
Joys that bloom and woes that blight—  
Like the track left in the heavens  
By a meteor in flight?

Is this world of dreams without us,  
Or within us does it flow?  
I know only this—that many  
Whom I never saw I know!

—Gustavo Adolfo Becquer  
in *Kansas City Star*

IN sleep the *linga sarira* (astral double) partially dissociates itself from the body, thus cutting off the connexion between the mind and its physical organism and rendering the physical senses dormant. The active vital functions also become lessened for the same reason. It is necessary to distinguish between deep sleep and the borderland of dreams which fringes it. In deep dreamless sleep the mind is dissociated from all earthly connexions and experiences a high state of consciousness so different from our waking state that we cannot bring back any recollection of it unless our progress along the path of knowledge has carried us to a certain point. The *dream* state is a condition wherein the mind is occupied with its own images, which to it

seem as real and objective as do the objects of the outer world when we are awake. In this state, as said in the lines above, the passions and delusions still remain.

We should not regard sleep entirely from the point of view of the body; for to the Soul it is a period of awakening and liberation. It is much more necessary as a refreshment to the Soul than as a rest to the body. The idea that we may in deep sleep see some of the persons

whom afterwards we shall meet is reasonable; still there are other ways of accounting for such real or apparent recognitions.

In dreams, the fact that we see the images of persons and places by no means proves that we visit them; for we have all these images in our minds and look at them as we would look at a picture book. Usually the *dramatis personae* of a dream wear the trappings found in the green-room of our imagination; and when we dream of seeing a person, doing something, the figure is very often merely that of somebody we happen to have contacted or thought about and has no connexion whatever with the actual person. It is most noticeable that the imagination seems often unable to create certain faces and contrives the dream in such a way that you do not see the front of the figure or else supplies it with a wrong face. Again there are certain things the imagination cannot do; for instance, perhaps it cannot create the sensation of entering water; and a dream about bathing always results in indefinite postponement, by one excuse or another, until waking comes. The dream stage-manager is a rather incompetent person, not to be relied on.

The *linga sarira* cannot stray far from the body during sleep. Sometimes it is attacked and makes a hasty attempt to get back into the body, in which it may for a time fail. Most people must be familiar with this experience. STUDENT

THE nature and functions of real dreams cannot be understood unless we admit the existence of an immortal Ego in mortal man. . . . But if we admit the existence of a higher or permanent Ego in us—which Ego must not be confused with what we call the "Higher Self," we can comprehend that what we often regard as dreams, generally accepted as idle fancies, are, in truth, stray pages torn out from the life and experience of the inner man, and the dim recollection of which at the moment of awakening becomes more or less distorted by our physical memory. The latter catches mechanically a few impressions of the thoughts, facts witnessed, and deeds performed by the inner man during its hours of complete freedom. For our *ego* lives its own separate life within its prison of clay whenever it becomes free from the trammels of matter. . . . But the physical man cannot feel or be conscious during dreams; for the personality, the outer man, with its brain and thinking apparatus, is paralysed more or less completely.

We might well compare the real Ego to a prisoner, and the physical personality to the jailer of his prison.—H. P. Blavatsky

## THE THEOSOPHICAL ADDRESS AT ISIS THEATER

THE address last Sunday evening at Isis Theater was given by Mrs. Marjorie Tyberg, on "Woman's Influence on the Trend of the World."

This question, said the speaker, becomes of more serious moment every day, as in the upheaval of old conditions that is taking place the world over, women are moving into wider fields of action and assuming responsible positions in every department of activity.

Lost indeed to all sense of the dignity and

H. P. Blavatsky know that by working in externals alone it was possible to do but little in affording better conditions for woman's development, unless also women have the inclination to better the conditions within themselves; and she taught that the real work must begin within. We know well that women may move *out* of old places without moving *up*, but the Theosophical teaching inspires a righting of the nature within that results in a movement outwards and upwards in harmony with the Law. Katherine Tingley, continuing H. P. Blavatsky's work, is directing the application of these teachings to every depart-

In the clear skies of California the moon shines very brightly, and with patience and a rapid lens moonlight photographs are possible with long exposures. The present illustration, one of the gateways of the International Theosophical Headquarters, is interesting as being actually made by the light of the moon. The exposure was something like 50,000 times more than it would have been for noonday sunlight.

As an example of the accumulative effect of light upon a photographic plate the radiation of the lights of the buildings is of interest. It will be noticed that the sky above them is

Lomaland Photo. and Engraving Dept.

(PHOTO TAKEN BY MOONLIGHT)

possibilities of womanhood must that woman be whose heart does not thrill at the daily record of events that concern the welfare of her sex. It is not confined to any one country or hemisphere, but Japan, China, Turkey, and Persia, alike show the influence of the new time as well as the Western countries.

The most inspiring and effective work of the 19th century, and done by a woman, was the work of H. P. Blavatsky, who brought back the knowledge of the great truths concerning human life, and made it possible for women to take up the thread of a glorious life lived long ago, and once more wield the influence that makes the world's trend upward to the highest mark it may while the present cycle lasts. The effects of her work are seen on all hands, though only those who have familiarized themselves with her aims and efforts may be fully aware that her's was the hand that broke these barriers down. Well did

ment of life, and to the women of the world she has said:

O Women of the world, be a strength unto yourselves! Become mighty engines of force, divine centers of spiritual light, that you may illuminate the pathway of others; that your own minds may be lighted from the fire within your hearts; that you may stand forth as Spiritual Redeemers.

OBSERVER

### Moonlight Photographs

FEW of the so-called moonlight photographs are made by the light of the moon, but are really the work of sunlight under certain conditions producing the *effect* of moonlight. However, under the light of a full moon in clear atmospheres like that of the High Alps, moonlight pictures are not only possible but fairly easy to obtain. Where so much white light fills the picture, as does the snow of the mountains, the reflected light is of great value in securing definition.

bright whilst outside their field of illumination the usual blackness of night prevails.

### Phosphorus Matches to be Made Illegal

A BILL has been presented in the House of Commons (England) to prohibit manufacture of white phosphorus matches, on account of the painful and deadly disease of necrosis or "phossy jaw" which the operatives contract. This has been arranged by consultation with the manufacturers; and the holders of patents on matches made with red phosphorus, the kind that strikes on the box, have agreed to the insertion of a clause making the processes available on reasonable terms to all manufacturers. E.

THE German government is about to enlarge the Kiel Canal, and it is said the new locks will be 150 feet wide, which is much greater than that proposed at Panama. D.

### Christianized Paganism in France

WRITING of Brittany, de La Borderie says that the British emigration gave to that portion of France ("the Armorican peninsula") a new population of Celtic race and tongue, which acquired, cultivated, and Christianized the land; in a word, created Brittany. How far the Christianizing process was effectual is an interesting point: the "veneer" of the newer religion upon the older one seems in places to be very thin, so thin that there is little difficulty in discerning the earlier formation. An eminent native of St. Malo, Chateaubriand, published just over a century ago a work entitled the *Génie du Christianisme*, which was intended as a defence of the Roman Church. Critics agree that its main value lies in its brilliant descriptive passages, and with regard to these even, Sainte-Beuve declared his opinion that many of them would have been more warrantably included in a work on the genius of Paganism! A circumstance which occurred at Langon, in the Côtes-du-Nord, throws a curious light on the relation between the old pagan worship and Christianity as understood in the Armorican peninsula, and how the "Christianizing" process was carried out. At this place is a chapel which was a one time a Roman temple of Venus, held in the highest esteem by the inhabitants of the locality. It was in the year 838 that it was turned into a chapel. In the apse was a fresco of a "heathen" character, namely the goddess rising from the waves, surrounded by cupids. To carry out the Christianizing idea, this fresco was whitewashed, but recently the whitewash peeled off and the relic of paganism underneath was disclosed. Formerly the Capella St. Veneris, then a chapel dedicated to St. Agatha!

Notwithstanding the whitewashing of paganism, actual and metaphorical, the people have remained essentially pagan. A curious illustration of the truth of this statement occurs at Midsummer, the time of the summer solstice, when the sun reaches the farthest north point in his annual journey through the Zodiacal constellations. At Plougastel there is held at this time the "Pardon"—Brittany is a land of Pardons. Great fires are lighted and the children are passed through or over them. Then the people gathered round the fire take up ashes and rub their eyes with them—afterwards reciting the "Lord's Prayer" and the "Hail Mary!" "A curious example," as a popular writer puts it, "of an institution that was pagan, with a touch of Christianity applied to it." At Plowaret is a dolmen turned into a chapel of the Seven Saints! Many of the numerous menhirs—tall rude stones, more plentiful in France than in any other European country—have undergone a like conversion, a cross has been carved upon them, in accordance with the fashion set by St. Sampson and St. Patrick. The former found the Cornish natives dancing round a tall stone. His Christian zeal caused him to put upon it the cross; the latter, finding the Irish venerated a well in which were the bones of a Druid, turned the well into a Baptistry and gave the people Christian relics to revere.

So prevalent was "stone worship" in Brittany, that at a Council held at Nantes in 658 the following decree was issued:

As in remote places and in woodlands there stand certain stones which the people often worship, and

at which vows are made, and to which oblations are presented, we decree that they be all cast down and concealed in such a place that their worshippers may not be able to find them.

How that decree was carried out, or rather how it was evaded, any visitor to Brittany can see. Indeed, who was to do the work of destruction? The country parsons—as the author of the *Book of Brittany* says—had for the most part been brought up to venerate the "monuments mégalithiques." They as a rule contented themselves with marking them as Christian by putting on them a cross, as on the menhir near Dol.

Sitting on the granite rocks at Dinard this summer, in the glorious sunshine, I noticed two young Breton girls, evidently from the country, crossing the beach to bathe. As soon as they reached the water's edge, each girl stooped, dipped a finger in the wave, and made the sign of the cross. So did they honor that "Star of the Sea" who is the Christian counterpart of all the Pagan Virgin-Mothers.

Very religious these people, one might conclude; but an acute observer, quoted in the *Book of Brittany*, says: "One must always insist on this: the people have remained pagan to their marrow bones." There is "no connected system of doctrine" with them; only "an extraordinary jumble of rites and formulas and ceremonial usages . . . and these as ancient as the race itself." The midsummer "Pardon" at Plougastel proves it. Paganism is in the air of Brittany, or perhaps it would be more correct to say, in the ground, on which rest thousands of these great stones. These are surely not the work of any "race of dolmen builders," as some archaeologists suppose. They speak of a time when England was not entirely separated from the continent, and there was land where are now the Straits of Gibraltar; a time when Initiates traveled from Egypt as far as the (present) British Isles, dryshod, and left these mighty monuments which eloquently speak of a distant era in the world's history, of which history, says Madame Blavatsky, they are all symbolical records.

F. D. UDALL, M. J. I.

### Sven Hedin in Tibet

DR. SVEN HEDIN continues in *Harper's Monthly* for September the account begun in the August number, which was reviewed in the CENTURY PATH, No. 48 of this volume.

He journeyed around the sacred mountain called Kailās by the Hindūs, Kang Rimpoche by the Tibetans. Pilgrims come from the Kham mountains on the extreme east, from Naktson and Amdo, from the black tents of Tibet, and from Ladak in the far western mountains; thousands of pilgrims on foot, who, deeply meditating, wander the four miles around this mountain; of all ages, many of them rascals, anxious to perform this rite before dying, though death sometimes claims them ere the task is complete. Hedin also wandered round the mountain, which took three days. He passed two young Lamas who were doing the journey "by prostration." Lying at full length on the ground, they would join both hands over their heads and read a prayer, then make a mark on the road, rise, again join their hands and pray, take a few steps and prostrate themselves again. Thus they measured the whole route with their

bodies; it took twenty days, and these two lamas contemplated doing it twice. They had spent a whole year on the journey from Kham. One of them, though only twenty, was to pass the remainder of his life entombed in a dark grotto.

In such a grotto at Linga-gonpa was a lama who had already been immured for three years. No one knew his name or whence he came. On the day of his arrival he was escorted to the cave by a solemn procession and walled in in total darkness, never again to see the light of day or hear a human sound. Night and day he is sunk in profound meditation, as the lamas believe; his food is passed in through an underground passage, and its disappearance is the only means they have of knowing whether he still lives. In another place there is one who has been immured for sixty-nine years!

In the course of a glowing description of the intense religious life of Tibet, Dr. Hedin speaks particularly of the temple music—of wonderful hymns sung in fresh young voices, of the bassoons and flutes, the clashing of cymbals and the rolling of drums, pervading the dim candle-lit sanctuary and making an atmosphere of sweet peace in which one might sit for hours in tranquil contemplation. The account of the many kinds of temples and lamaseries and their imposing ceremonials gives an impression of religious life that makes the Roman church sink into a pale and feeble copy by comparison.

The opening up of this wonderful land will constitute another of the great eye-openers for Western complacency. Here is a country which we had contemplated as a mission-field, and we find, among other things, that it is so far ahead of our expectations in all that pertains to exoteric religion that to send missionaries of Christianity to it is as if a vendor of coals were suddenly to discover Newcastle. There seems to be no single ceremony, rite, or symbol of our churches that is not found in much more emphasized form in Tibet; and all the saints, candles, banners, incense, etc., are duplicated in the West.

The teaching conducted by the lamas is also mentioned, and it is of a kind that takes little account of physical conveniences and weaknesses. These hardy devoted Tibetans do not seem to believe in making things too easy for the religious aspirant.

T.

### Sawing Buildings in Two

THE oldest church in Munich (says the *Scientific American*) has recently been protected against further invasion of damp by having the stone foundations sawn across horizontally and sheets of lead interposed. A special machine was made which inserted the lead automatically as the cut was made. In Paris a four-story building was sawn in two from top to bottom by a twisted wire cable.

It is an electrical sub-station of the Compressed Air Company, fitted with accumulators which distributed the current furnished by a generating station. Wishing to supply more current, and the building being unable to bear the weight of additional accumulators, they decided to erect generators in the basement. But to do this it was necessary to cut off the house from the adjacent buildings in order to avoid damage suits for vibration.

## Welsh Literature --- Prose --- Tenth Article

### THE ROMANCES IN THE RED BOOK OF HERGEST

**H**AMLET is a myth, and so you may drink and drink and drink, as Thor drank from the horn the dwarfs gave him, of the waters of its meaning, and still float three hundred ships of speculation, of inquiry, of brooding imagination on the sea that would be left. We do not care what Shakespeare meant about him; what we care for is beyond the author. It does not matter to us whether Shakespeare intended that he should be mad, but whether this imagined man was mad in fact, or not. But the *Pilgrim's Progress* was written to convey a certain teaching; each incident and picture being carefully framed around the perception of truth it was meant to typify.

But these old Welsh tales are myths, therefore are they worthy for us to brood deep and deep upon them. Have no fear to sink your buckets one after the other; there is good water and enough, although the whole world be athirst. The race that would destroy us and against whom we have so little power as a rule to discriminate; the dragons of the two extremes, that we must bury beneath the highest mountain in our beings; the thief of spiritual life that overcomes all watchfulness with the infinite, soul-stealing sweetness of the music that precedes him—these need no interpreting for any student of life, because they convey their meaning in the best possible way, in the simplest way: in the symbolic form in which they are cast.

This is especially true of the Tale of Taliesin, the chief and pearl of all the stories of Wales, fullest flower of all of the scent and honey of mysticism. Gwion Bach was set to watch the Cauldron of Ceridwen, in which Three Drops of the Wisdom of the Ages were brewing. For a year and a day the Cauldron was boiling among the mountains: nine fairies were watching and blowing the fire; Gwion and an old, blind man were stirring, and Ceridwen herself was roaming the hills, gathering the herbs in their seasons.

Three scalding drops fell on the fingers of Little Gwion, and they fell "in the form of the Name of God," like three rays of light shining down from a star. He put his fingers in his mouth to ease the pain of the burning, and instantly became aware of all knowledge and wisdom, and all the sciences and arts, and most of all became aware that he was in peril from Ceridwen, and must flee from her. The Drops of Wisdom being out of it, the Cauldron broke with the venom of the rest of its contents, which poured down in a flood of poison to the sea. But Gwion Bach fled over the hills, seeking refuge from Ceridwen. She, finding all her labor wasted, pursued him; now in this form, now in that. First he was a hare and she a hound; next they were trout and otter, then dove and hawk: when she was on the point of catching him he assumed the form of a grain of barley and fell among

thousands of other grains in a farmyard. There she took the aspect of an old gray hen with a tuft of black feathers on her head; and of all the grains swallowed only that one grain which was Gwion Bach. Thereafter he was born of her, and she put him in the sea in a leather bag, where Elphin the son of Gwyddno found him. Elphin and his wife adopted him, and called him Taliesin by reason of the brightness of his forehead, which shone like the front of dawn, like the morning star in its beauty. He was a marvel whose origin was not known; his original country was the Region of the Summer Stars; he had been a Teacher to fourscore generations; he had been on the high cross of the merciful Sons

then forget them! They never trouble the surface of life in the mediocre and indifferent; but let it be bruited abroad within you that all the vast depths and caverns shall be cleared; let but the three drops of regeneration enter you, and you have roused up the foe of foes. Elemental nature is a wall around us, fortified and manned by goblins against our breaking forth into freedom. Yet that wall, once stormed and broken, becomes the gateway into freedom; and it is elemental nature who is the mother of the soul made free; the mother, the servant, and, we may say, the worshiper; for he is indeed her god, from whom she holds nothing. So Gautama was born of Mâyâ, the great Illusion, that is

Lomaland Photo. and Engraving Dept.

### RETURNING FROM THE "FIERA"

CONVEYANCE AND COSTUMES OF SIENESE VILLAGERS

of God, and would remain on the face of the earth until the day of doom.

Now how shall we interpret all this? Mother Nature is the foe of the man who is not yet self-conquered, pursuing him with myriad seeming persecutions whose end is purification and the new and spiritual birth. In reality it is our own acts that haunt us. If we are signalled out from the mass of men by divine right of long search and service, for commission among the ranks of the guardians of the world, every effort brings down on us out of the past, avalanches of stored-up trouble, the result of long accumulations of mistakes. The kingdom of heaven must be taken by violence; its guardians are to be found in the depths of our lower natures. These depths seem to us to be almost infinite, and contain more monsters than the sea's self. Think what aeons we have had in which to give them birth and

nature; and Mary, the Star of the Sea, has the same meaning; for the sea also was counted the All-Mother.

Afterwards Taliesin, who became Elphin's Teacher, set him free when he was a captive to Maelgwn Gwynedd in the north. Taliesin brought together the winds of heaven by his music and magic, to shake the fortress of Maelgwn, till the latter was compelled to let Elphin go.

Here we find an image of how the soul goes to work to rescue the mind out of passiondom; how it brings the turmoil of the world to bear on the prison-house; shakes and batters to pieces all old ideas, feelings, desires, opinions and dislikes; brings us through overwhelming confusion and often disaster, into peace. It is the doctrine of Karma, the Law which uses all our acts for our ultimate benefit and tuition. A WELSH STUDENT IN LOMALAND

OUR schools, says a contemporary, are searching earnestly for practical methods in education; and are introducing, to replace or supplement the more cut and dried studies, such subjects as cooking, sewing, and agriculture. Yet, even in these, continues the writer, there is grave danger that the introduction of the formulating and mechanizing tendency will destroy their usefulness. This tendency to reduce everything to a system takes the life out of teaching.

Educationalists are always trying to make up for deficiencies by teaching more subjects or changing the system. But much more depends on the manner of teaching than on what is taught. The object of education should surely be to train young people to use all their faculties for the benefit of the society of which they are to be members. Education is of course divisible into the three main heads of moral, mental, and physical. But, leaving aside for the moment two of these, let us consider the other, the special field of school education, the education of the mind. What should be the aim here?

Mental education should fit the pupil to use his mental faculties to the best advantage. And what are the chief faculties to be cultivated to that end? They are concentration, memory, alertness, versatility, adaptability, and so forth. One almost fears to enumerate them lest some well-meaning crank should forthwith invent a new "subject" for the syllabus and compel unfortunate teachers to give classes in these things; and visions of a printed schedule of rules for teaching attention and alertness, with graduated exercises by Professor This, rise before the mind's eye. However, these things are not to be taught by system but by personal influence, and not directly as subjects, but indirectly. Without a groundwork of such faculties, a firm superstructure is impossible; but with this groundwork, a firm superstructure can be reared out of the slenderest resources. The properly

## School and Home

grounded pupil will be able to find nourishment for his mind anywhere and everywhere; but the pupil whose mind has not thus been disciplined and prepared will be unable to assimilate even the most carefully cooked mental pabulum. Hence the training of these faculties is of primary importance. But we cannot stop here.

### THE PATH OF PRAYER

From *Out of the Nest* by MARY FENOLLOSA

AMONG the gnarled pines of old Japan  
That shade a hill where patient crickets sing,  
I chanced upon a hidden path that ran  
Upward, beneath a mystic covering.

A hundred gates the sacred pathway keep,  
Mere stems of red, with one straight beam across;  
In rigid angles mounting up the steep,  
Their scarlet hue bepatched with ancient moss.

And, springing from the mould on every side,  
Like ghosts of grass that march in pilgrim band,  
Grew fluttering papers, written all, and tied  
As banners pendent from a mimic wand.

I wandered long; when, from the drowsy wood,  
A whisper reached me, "'Tis the Path of Prayer,  
Where, nightly, Kwannon walks in pitying mood,  
To read the sad petitions planted there."

Ah, simple faith! The sun was in the west,  
And darkness smote with flails his quivering light.  
Beside the path I knelt; and, with the rest,  
My alien prayer was planted in the night.

We are led right on to the subject of moral training, which at this point overlaps the subject of mental training. Nor is it possible to keep physical training out of view in this connexion. All three are so closely interdependent. The efficiency of the mental apparatus depends so much on the health and so much on the character, a truth obvious enough.

Is not much — perhaps most — of the time and labor of the teachers spent in overcoming and resisting inattention, listlessness, restlessness, perversity, hostility, and all the host of afflictions, mental, moral, and physical, under which their pupils labor? If so — and we know that it is so — then the teachers are working at an enormous disadvantage. This is a state of affairs which surely ought to appeal to the American, so expert in detecting and removing all sources of waste and inefficiency from his manufacturing and commercial industries. How are we to remove all this friction and waste of power from the machinery of our schools? Not by feeding in more and more expensive materials.

This brings us to the point that it is essential for the teacher to have the support of the parent. The parent has the child during the most important period and does his work first; and his work is so important that though the teacher may improve on it when it is good, he cannot counteract it when it is bad, especially if it continues to go on. It is a shame to blame the teacher for not turning out better results from some of the human material that is sent him. He can scarcely, with his limited means, breed habits of self-control and obedience in children who have not been brought up in them, or who, as in many cases, have been trained in an opposite direction. Evidently if there is anything the matter with the schools, it is in discipline rather than subjects, and that is chiefly the fault of others than the teachers. Let those who have children about whom they are concerned remember that theirs, as parents, is the position of vantage. The home is the center of power, and if that neglects its duty, who can repair the neglect? Katherine Tingley has said — and her students can repeat the statement scarcely too often or too emphatically — "if all homes were what they should be there would be no need of Rāja Yoga Schools." This is worth thinking over. A RĀJA YOGA TEACHER

THE PROTEST OF LUTHER. PAINTING BY LINDENSCHMIDT  
ORIGINAL IN THE METROPOLITAN MUSEUM OF ART, NEW YORK**Charity---Transitory and Permanent**

CHARITY is a conspicuous phase of our modern civilization and woman is directly or indirectly its prime mover. Our large cities abound in free hospitals, homes for incurables, old ladies' homes, orphan asylums, reading rooms for working girls, night schools for boys, rescue homes for women, and a thousand similar philanthropic undertakings.

Americans are prodigal; they are noted for getting and spending and lavishly giving, and so it is that charity often becomes a fad with American women, the pleasures derived from the display of giving being considered reward in full for the deed. Some like to appear generous, and others ease their consciences by giving the overflow of their purses; but many not only give money to maintain these institutions but also their time and thought and labor, and the good done by these unselfish workers is beyond dispute.

This is the day of educated endeavor, of competition in all things, even in philanthropies, and the charity that is really going to be of permanent benefit to the race must be something different and higher than even the best existing today. It must meet the deeper *spiritual*, as well as the bodily, needs of the people.

Though charities increase every day, crime is far from decreasing; and reformatories, insane asylums, and penitentiaries, are filling the country. Many organizations are fighting the evils of the day but as yet have made almost no headway against them. Some have the power to see evil, but few can recognize

the cause, and fewer still are wise enough to suggest, and unselfish enough to apply, a remedy. Jesus the Christ suggested one, but the church has not had the courage to adopt it for fear of the sifting process it would cause in the ranks of religionists.

As the viewpoint widens one's idea of charity changes. Real charity consists in giving everybody a fair chance in the world. You can't tame a man by keeping him in ignorance of the great Law so that he is unable to believe in the justice of God and nature, then throwing charities at his head in the hope of pacifying him. The time has passed for sitting contented and happy in the belief that Providence has the matter in hand. All other methods having failed, the time has come again for giving man a solid base from which to shape his career, for teaching him that there is a plan and purpose in the world; that there is no partiality in nature, the wages that she pays being absolutely just, yet that it is in his power to become a better workman and so to have these wages, so to speak, doubled; that man makes his own envioning conditions and he alone has power to change them — laws cannot, neither can charities; that death is neither to be dreaded nor feared, nor is it to be considered an escape — nay, it is simply an incident in life, a period for rest and re-adjustment before beginning another day when man shall reap what he has sown — to sow again.

How much more virile is a philosophy which shows a man that though his life may have been a failure, he has a chance to pay

off old scores, to start out afresh and work his own way to the top — than a creed which teaches him that for a day's work he either loses all or must go into a Paradise for which he is unprepared and unfit, on the merit of somebody else?

To give men and women this foundation for living, this incentive for morality and enlightenment, is the real, the higher, charity. St. Paul distinguished between the lasting and the fleeting types of brotherliness, or true philanthropy, when he said: "Though I bestow all my goods to feed the poor and have not charity, it profiteth me nothing." STUDENT

**Jottings and Doings**

(From a Student's Note Book)

IT is said that Miss Madeline Edison, daughter of the distinguished American inventor, promises to follow in her father's footsteps. She has recently invented a most ingenious automobile road-map, which like the compass of a ship is fastened to the steering column in a case that is rain- and dust-proof, the map being lighted by electricity at night. As the car speeds along a cyclometer records the distance covered while a tiny black steel bar indicates on the road-map the exact location of the travelers.

Miss Edison, who is only twenty-one, took high honors at college in electricity, chemistry, and the applied sciences, and while at home often aids her father in his laboratory experiments, a logical outcome, for during the daughter's college course she was always certain of her father's kindly aid in her studies.

# OUR YOUNG FOLK

## Camille Corot

**A**BOUT a hundred years ago there lived in Paris a sunny-tempered, round-faced boy, whose parents kept a shop not very far from the Louvre, the famous picture gallery of France. His name was Camille Corot. He was a good, obedient lad, and learned his lessons so well at school that he won a prize. This enabled him to go to a college in Rouen. When Camille came home from school, his parents thought that he would surely like to work in their pretty shop, for some day it would be his. Corot's mother was from Switzerland and must have had very deft, clever fingers, for she made beautiful bonnets and gowns for the ladies who came to the little shop. His father was the bookkeeper and general manager. He was a most careful, painstaking man, and trained his son to the same habits. Both his parents tried to interest young Camille in the affairs of the shop, but try as he would, he could not find ribbons and laces, nor casting up long rows of figures in an account book, interesting. But he did love to draw pictures and would draw sketches of noses, hands, and eyes on the wrapping paper, as customers came and went. Every moment that he could spare from his work he spent staring at the shop windows where there were pictures—and there were many of these in Paris; or he would slip into the beautiful galleries of the Louvre. There he would stand for hours gazing at the wonderful paintings. Of all the pictures there he loved those of Claude Lorraine, the landscape painter, the best. The out-of-door scenes that this artist painted were filled with golden sunlight, so it is no wonder that they were his favorites.

When Corot's parents saw that his heart was not in the work in their shop, and that he longed so to be an artist, they wisely decided to let him have his own way, especially as he was now a man, and ought to know his own mind. They gave him a small yearly sum of money, that he might not want for food and clothing, and bade him follow his own wishes. Corot's heart was filled with joy and with tears in his eyes he embraced and thanked them for their goodness. That very day he packed up his easel and paint-box and set off.

He went to the studio of a great artist to learn to paint. Here Corot did just what he had done at home. He tried very hard to paint just as his master told him, and he succeeded. Still he was not satisfied. Something in his heart told him that to paint golden landscapes, as Claude Lorraine had done, he must work out of doors. So he bade his master goodbye, and with easel and paint-box and a little clothing tied in a bundle slung over his shoulders, he started off to walk down into Italy.

From this time on the artist Corot led a wandering life. Nature and his love for her taught him to paint. He was so sunny-tempered, gentle, and simple that everyone loved

## FRAGMENT

Ralph Waldo Emerson

**T**HINK me not unkind and rude  
That I walk alone in grove and glen;  
I go to the god of the wood  
To fetch his word to men.

Tax not my sloth that I  
Fold my arms beside the brook;  
Each cloud that floats in the sky  
Writes a letter in my book.

Chide me not, laborious band  
For the idle flowers I brought;  
Every aster in my hand  
Goes home loaded with a thought.

There was never mystery  
But 'tis figured in the flowers;  
Was never secret history  
But birds tell it in the bowers.

One harvest in thy field  
Homeward brought the oxen strong;  
A second crop thine acres yield,  
Which I gather in a song.

him. To his parents he was always a big, obedient, affectionate boy, who never seemed to grow up. They never knew how great a painter their own son was, for they did not know how much poetry and music there was in his heart. He painted these into his pictures, and so they were different from those of all other artists. This is the reason their beauty was not seen at first. But now people have caught a glimpse into his heart, and so they have received new eyes, as it were, and see Nature as Corot saw her, filled with music and poetry.

Corot was always a welcome guest at every wayside inn or farmhouse. He wandered through France on foot, especially through northern France, singing and painting as he went. He painted in the forest of Fontain-

bleau near the little village of Barbizon, and other artists followed him there. Among these was Jean François Millet, the greatest of them all. Some day you shall hear of this great artist and noble man.

Corot loved best to paint the early morning, before the sun arose. Before dawn he would steal out into the sweet wet woods and watch the pearly white light creep up over the sky, changing the night mists into veils of silver. Through these the trees arose in pale silvery green masses, and he would paint them thus.

Corot loved to paint walls, although there was not much chance given him to do this kind of work. Once he said he wished that he could paint the walls of all the prisons in France, for he was sure it would make the prisoners good just to see the blue sky. During the siege of Paris Corot remained in the city although he could have left it. He gave all his money for the building of hospitals and nursed the sick and wounded himself. He was so dearly loved that people called him "Papa Corot." He painted his most beautiful pictures after he was seventy years old, which shows that he was still a boy in his heart, always learning. Corot did not like to sell his pictures. He only parted with them that he might have money to give away.

Just before the gentle, sweet-natured old artist passed away, he had a vision in which he saw "a landscape with a sky all roses, and clouds all roses too." It was the reward for all his goodness. STUDENT

## Little Stories about Plato

**P**LATO, the great Greek philosopher and teacher, practised self-control faithfully. One day he was about to strike a slave, but restrained himself in time. He remained standing still with his arm raised, in the posture in which he was when he remembered himself. One of his pupils asked him what he was doing.

"I am punishing a passionate man," answered Plato.

Some one once said to him, "You are an old man; you will soon die. Why do you study? Why trouble yourself to learn more? You are the wisest man in Greece now. How long will you go on?"

"As long as I am not ashamed to grow wiser and better," answered the philosopher.

At another time his disciples told him that he had enemies who were spreading slanders about him in Athens. But Plato only smiled. "I fear them not," said he, "I will live so that no one can believe them."

THE beauty of everything here below lies in the power of reaching perfection.

ART for Art's sake may be very fine, but art for progress is still finer.—Victor Hugo

KNOWLEDGE of a thing engenders love of it; the more exact the knowledge, the more fervent the love.—Leonardo Da Vinci

# THE CHILDREN'S HOUR

## THE SING-AWAY BIRD

Lucy Larcom

**H**AVE you ever heard of the Sing-away bird,  
That sings where the Runaway River  
Runs down with its rills from the bald-headed hills  
That stand in the sunshine and shiver?  
"Oh, sing! sing-away! sing-away!"  
How the pines and the birches are stirred  
By the trill of the Sing-away bird!

And the bald-headed hills, with their rocks and their  
rills,  
To the tune of his rapture are ringing;  
And their faces grow young, all the gray mists among,  
While the forests break forth into singing.  
"Oh, sing! sing-away! sing-away!"  
And the river runs singing along;  
And the flying winds catch up the song.

'T was a white-throated sparrow, that sped a light  
arrow  
Of song from his musical quiver,  
And it pierced with its spell every valley and dell  
On the banks of the Runaway River.  
"Oh, sing! sing-away! sing-away!"  
The song of the wild singer had  
The sound of a soul that is glad.

And, beneath the glad sun, every glad-hearted one  
Sets the world to the tune of his gladness:  
The swift rivers sing it, the wild breezes wing it,  
Till Earth loses thought of her sadness.  
"Oh, sing! sing-away! sing-away!"  
Oh, sing, happy soul, to Joy's Giver,—  
Sing on, by Time's Runaway River!—*Selected*

## Guard Thou the Lower Lest It Soil the Higher

**E**ACH one of you is a sentinel, stationed  
to keep watch over a fort—a responsible  
and important post; for if any of the  
enemy enter, disorder and defeat result at  
once. You have several gates to guard and  
your enemies are very cunning and sly. They  
have been the enemies of all the boys and  
girls who ever lived, and all the children who  
failed to keep strict watch and let these foes  
enter helped them to grow strong and to in-  
crease in number. There have been many  
failures of this kind so that now it is neces-  
sary to be more vigilant than ever.

You all know what a protection the pass-  
word is to the sentinel pacing up and down on  
guard. When someone comes along whom he  
does not recognize as a friend he has a test  
ready. He can challenge the newcomer, and  
if he does not get the right answer—the pass-  
word—he need not hesitate a moment; for  
no one who does not give the right word need  
be permitted to enter.

It is almost impossible to imagine a sentinel's  
forgetting the pass-word. It would seem ridi-  
culous for anyone to be a sentinel who can-  
not always remember it. But some of the ene-  
mies who come to your gates have a way of  
giving certain answers to your challenge that  
makes you forget. One of these answers they  
give when they see you trying to be vigilant  
and know that they must be very sly in order  
to get in is "Just this once." These words  
have a sort of evil magic that destroys your  
memory. Almost every time they are uttered

your pass-word slips away from you and the  
enemy enters, gets a foothold and defies you  
to oust him.

Another answer which your enemies give  
and which makes you forget so foolishly and  
fail to see that they are foes is "Well, I don't  
care." These words have been spoken so often  
at careless moments that now the evil ones  
use them to coax their way in everywhere. If  
you ever hear a voice whispering these words  
try to remember to take a sharp look about  
you and stand very firm and steady without  
listening to the sly speaker of them. He will  
slink away as soon as you do this, though he  
may come to another of your gates the very  
next hour. A rebuff at every gate he comes  
to is the only treatment that he deserves.

If you guard well, if you can keep your  
fort free from the enemies, you will find that  
a great shining some one within your own  
heart begins to make you feel a beautiful kind  
of sacredness about all your work and all your  
play. At first it seems too good to be true  
for you feel that you understand the meaning  
of all you do. Every time you relax vigilance  
this shining self grows dim and blurred, and  
if you keep on letting enemies in you may  
lose sight of this true self for a time, until  
you have made a great effort to keep firm  
guard and succeeded.

The pass-word you have to hold in mind is  
"Brotherhood." If you have that clearly be-  
fore you and never forget to challenge, the  
enemies know at a glance that you cannot  
be hoodwinked into letting them enter. As the  
beautiful new life grows strong in you, and  
you can protect your shining self from the  
foes without, you will realize better every day  
what an important duty it is to "guard the  
lower lest it soil the higher." M. G.

## The Peacemaker

**T**HE children had been quarreling in the  
nursery during Nurse's absence and the  
broken harmony had brought the usual  
pain and trouble in its train. Little Nell rarely  
asserted her rights, but to see her best-beloved  
doll in the ruthless grasp of brigands as re-  
presented by her brother, proved too much  
for her feelings; and entreaties being in vain,  
she flew to the rescue; and in the struggle  
poor dollie lost an arm and leg. Softly sob-  
bing she was finally tucked into bed with the  
maimed doll still clasped in her arms.

"Never mind, dearie," said Nurse comfort-  
ingly, "We'll mend her in the morning."

"I'll be the doctor," said the now repentant  
Bob, for he loved his little sister, even though  
he had not been taught to control his teasing  
ways. Nell gave a watery little smile and  
hugged her doll closer.

"You had better go to bed, Master Bob,"  
said Nurse coldly, "You have done enough  
mischief for one day."

Bob's face darkened and he turned to go,  
but it beamed again as Nell, starting up in bed,  
called after him, "Oh Bob, you be the motor-  
man to-morrow and Nurse be the doctor at

the hospital, and you make a motor and drive  
poor Dolly and me there; it will be such fun."

"All right Nell," he replied eagerly. "I'll  
make a fine car for you."

"I know he is sorry," Nell whispered to  
Nurse as she tucked her in again.

"Bless her dear little heart," said Nurse  
later, as she looked down on the sleeping  
child. "She is always thinking how to make  
someone happy; the world would be a better  
place if more of us were like her. And why  
shouldn't we be?" E. I. W.

## Among the Toymakers

**G**RETCHEN lived in the beautiful forest  
of Thuringia in far away Germany.

Her parents were peasants, and for  
hundreds and hundreds of years her fore-  
fathers had lived in the low wooden cottage  
in which she was born. There was a large  
family of children and Gretchen was the  
youngest. Besides a father and mother Gret-  
chen also had a grandfather and grandmother  
who were yet hale and strong, and she had  
great-grandparents too. They all lived and  
worked together happily under the one roof.

If you could have taken a peep into the  
warm living-room of the peasant cottage, as  
I did one snowy winter day, you would have  
thought that it was a very pretty picture in-  
deed. For every member of this big family  
from Great-grandfather down to tiny Gretchen  
was busy making toys. Yes, toys; for when  
Santa Claus wishes to fill up his magical knap-  
sack that must never grow empty, he usually  
goes first to Germany, the home of the toy-  
makers. He gets millions and millions of his  
toys from the forest of Thuringia in northern  
Germany where Gretchen lives; for here  
thousands upon thousands of families are  
busy making toys from Christmas time to  
Christmas time.

They make all kinds of toys. Some fam-  
ilies make only animals: woolly sheep, horses  
covered with hair, spotted cows, and even  
Teddy bears. Others make the leather and  
cloth bodies for dolls, and some make the  
dolls' dresses. Some families make only  
Noah's Arks filled with the funny little ani-  
mals whittled from wood, while others are  
glass blowers and blow the glass balls and  
ornaments of many shapes that are after-  
wards lined with gold and silver to hang on  
Christmas trees.

Once a week a wagon calls at each toy-  
maker's home to collect the toys. Then they  
are taken to the large cities. In the large  
cities many toys are made in factories, es-  
pecially the heads for dolls, which could not  
be made so well at home. From the cities the  
toys are sent all over the world.

Most of the toys made in Germany come to  
America, but sad to relate, the children here  
break as many toys as the children there make.  
They would not do this, I am sure, if they  
had ever learned to make toys themselves, or  
if they could watch flaxen-haired little Gret-  
chen and her brothers and sisters working so  
carefully over the pretty playthings. O. W.

# THE SECRET DOCTRINE

THE  
Synthesis of Science, Religion, and Philosophy

By H. P. BLAVATSKY

2 Vols., Royal 8vo., about 1500 pages; cloth.  
(Index of 30 Pages as in First Edition)

NEW POINT LOMA EDITION

To be reprinted from the original edition of 1888, as published by H. P. Blavatsky

Vol. I treats of Cosmogogenesis

### Agnostic Views

WHAT one may surely call a typical statement of agnostic views is to be found in an article contributed by Professor Goldwin Smith to the *New York Sunday Sun*, entitled "Man and His Destiny." In it the writer places his brain-mind in the dock, as it were, arraigning it before the public and pleading on his own behalf against its pronouncements. He says:

We are confronted with the great question of what the world would be without religion, without trust in Providence, without hope or fear of a hereafter. Social order is threatened.

Future leaders may have to increase the power of the state to make up for the loss of the power of religion. Belief in the inspiration of the Bible can hardly linger any longer in any well-informed mind; criticism, history, and science have combined to put an end to it. And why should a revelation upon which the world's salvation depended have been postponed till so late and made to so few? Apart from the Bible, have we any revelation of the nature, the will, the unity, the existence of Deity?

### Unrealized Possessions

It must apparently be owned, though we tremble at the thought, that we have none. We are left upon this shore of time, gazing into infinity and eternity without clue or guidance except such as we can gain either by inspection of our own nature with its moral indications and promptings, or by studying the order of the universe.

Everywhere good is in conflict with evil. Humanity slowly advances, but we cannot be sure that it tends to an ultimate perfection. Much in life seems purposeless. Multitudes live and die, apparently without contributing anything; animals suffer, apparently to no purpose; plagues and famines seem merely evil. Children die in infancy. A plan of which we are ignorant, but of which the end will be good, is apparently our only solution.

The belief that man has a soul inserted into a body, has, continues the writer, become untenable. Man is one; all grows and develops together; imagination cannot picture a disembodied soul.

Free will surely we unquestionably have. Necessarianism seems to assume that in action there is only one element—motive. But, as has been said before, there appear to be two elements: motive, and another—will; and of this duality we seem to be sensible when we waver in action or feel compunction for what we have done? Is it possible to explain moral repentance without assuming the freedom of the will?

### The Key to Man is in Man

What is conscience? When we repent morally are we looking only to the immediate consequences of the act, or are we also looking to the injury done to our moral nature? If the latter, does it not appear that there is something in us not material and point-

ing to a higher life? It is in close examination of our own nature that we are most likely to solve the enigma of our being. Much of us, no doubt, is material. Memory and imagination often act unbidden by the will; imagination often when we are asleep. We may find a material element even in the character as molded by physical or social circumstance or need. But is there not also a conscious effort of self-improvement not dependent on these? That all is material does not seem yet to have been proved.

Evolution is a great discovery. But evolution cannot have evolved itself, nor does there seem to have been an observed case of it. Points of similarity between the ape and man are not proofs of transition. Has any animal given the slightest sign of self-improvement or tendency to progress?

Mere difficulties of sense or intellect on mundane questions might be met by appeal to the mysteries of a universe which may conceivably be other in reality than to us it appears. But it is to be supposed that divine beneficence would give its creatures all powers of intelligence necessary to their moral welfare, above all those entailing reward or punishment in a future life.

Progress is that which distinguishes man vitally and immeasurably from all other creatures. Fitful, often arrested, sometimes reversed, it does not cease. It may point to an ultimate solution of the enigma of our checkered being such as shall justify the ways of God to man.

What is to be said in this connexion of man's aesthetic nature, of his sense of beauty and melody? Can they be the offspring of material evolution? As they meet no material need, we might almost take them for the smile of a beneficent and sympathizing spirit. The basis of the gifts no doubt is physical, but we cannot easily understand how they can have been developed by a purely physical process.

Then he speaks of the grandeur and order of the universe, and concludes by saying that we must seek the truth and not be misled by dogma; he is one of the many who doubt and would have their doubts set at rest.

Parts of the above might be termed an introduction to Theosophy in the form of rhetorical questions. These unanswered questions sufficiently show the weakness of the agnostic position. The strength of Theosophy is that it answers so many of them. It is of course impossible to deal with them adequately on the present occasion, and we must be content with a reference to the text-books and manuals issued by the Theosophical Publishing Company, and with a few general remarks.

In the first place, such an outlook upon human affairs as the above is blurred by inevitable limitations in several different fields of thought.

There is the view of history, for instance. As one gathers from the paper, that view is the conventional one which is the resultant (up to date) of the various converging lines of modern cultural development. Ingrained racial traits, mental tendencies, and traditional ideas from our Teutonic ancestry; a certain know-

### Inherited Limitations of View

ledge and culture gleaned from what has so far been rescued of Greek, Latin, and Arabian learning; theological predilections, accompanied with many deeply rooted intellectual prejudices from a very mixed Hebraic-Syrian source, filtered through the dregs of imperial Rome; the recent growth of a minor branch of science, which from the restriction of its sphere, has given us a very lop-sided picture of the universe. This, roughly, is what goes to make up the subject under discussion—Man and his Destiny.

In spite of his challenge of theological dogmas, the traditional prejudice of the old theological view of history still clings to the writer as indeed it does to the valiant of the champions of emancipated scientific thought. Do what they can, they cannot seem to rid themselves of the notion that man must have been created a few thousand years ago. The theologians said he was created 6000 years ago; the scientists have added a few more thousands and the emendation that man was not made but just "grewed." The theologians said he was made by God out of the dust; the scientists that the dust evolved itself upwards into man. The professor may deride these various dogmas, but still the fetish of the accepted evolutionist idea haunts him, and his picture of human history is one of a comparatively recent emergence from primitive barbarism. To him, religion has evidently been simply the wistful efforts of helpless man to understand the mysteries of his life and surroundings.

But Theosophists are not hampered by these notions that have grown up with our recent little civilization. To them human history is conceived on a vastly larger and grander scale. They point to Egypt, Chaldea, India, ancient America, as instances of civilizations which must have had a long unknown past behind them. They recognize a scheme of human history commensurate with the great periods of which geology, astronomy, and natural history tell us. They believe that what we call history embraces merely the story of a few minor sub-races. They point to ancient sciences compared to which our modern knowledge is still incomplete. Of all this any earnest and candid student will find as much proof as he can digest in the available Theosophical literature.

The universal prevalence of such allegories and symbols as the Creation, the Garden of Innocence, the Serpent, the Fall, the Flood, the Cross, the Redemption, etc.; the existence of identical symbology in such distant countries as India, Scandinavia, and ancient America—all of which is known by scholars, to their mental confusion—all this cannot be accounted for on the ready supposition that religion is a purely nature-growth. It is on the contrary the survival of the ancient Wisdom-Religion and its symbol language.

Then there are the limitations in connexion with the conception of *human consciousness*. The conventional mind seems unable to grasp the idea of the possibility of any other kind of consciousness than the familiar one. When it does try to rise to higher conceptions, it jumps at one bound from earthly man to the

universal Deity and conjectures a sudden and complete revelation of ultimate truth after death. But the gradations of consciousness are almost unlimited. Man in his present state does not represent a very startling idea of intelligence by comparison with what he has been at epochs in the past and will be again in the future. It is surely possible that there may be men on earth today who are on a higher plane of intelligence and perception, and to whom therefore the whole question must wear an entirely different aspect.

**A True Theory  
Must Square  
All Facts**

Theosophists do not appeal to any blind "faith"; their appeal is to facts and to sound principles. But it is necessary that they should first have a fair hearing; and as they are doing all in their power to make this appeal effectual, the blame of any failure must rest on the student. If asked, "Show us your proofs," they reply, "Study our literature." In it will be found teachings that make the facts of life fit into a harmonious and self-consistent whole. From the view-point of conventional notions, the facts of life necessarily seem frequently inconsistent with each other and with current theories about life. The supposition that man's existence is limited to a single earth-life is false; hence it cannot square with the facts. On this supposition, the world is full of purposelessness and cruelty and fatuity. But the facts of life, the great eternal laws of the universe, were not made with a view to the limitations of modern ideas; they were not made to accommodate the modern theological god or the modern scientific fetishes. They existed from all eternity.

**Man  
Is a  
God**

Man himself is a God incarnated in an animal. If he were merely an animal he could not have these doubts and troubles and would be at peace in the supposed general unquestioning harmony of universal life. But he is also a God and cannot rest. The thing is to *Dare* and to *Know*.

It is the age-long habitude of mental emasculation induced by false theology that has turned man into the craving supplicating creature that he is in his mental attitude. But he may go on waiting for ever for his god to do something for him—or at least until he decides to wake up and do something for himself, thus vindicating his Divinity. It is no use sitting down and hoping that God will reveal himself or vouchsafe to his humble creatures a little glimpse into his inscrutable wisdom. Man himself is of God within, and he already has the faculties; but it needs greatness of soul to unfold them. H. T. E.

#### Ecclesiastical Glosses

**A** CONTRIBUTOR to the *Scientific American* recently remarked that Giordano Bruno was burned for teaching that the earth revolved round the sun. The burning alive of this thinker and liberator is rather a sore subject in certain quarters, and the remark accordingly calls forth two protests.

The first attempts to show that the Copernican heliocentricism was if anything rather popular at headquarters; and the second purports to give the real reasons for the burning.

"It was the theory of Pythagoras," says the first letter. Does this suggest, for the benefit of those whose knowledge of dates is a little

risky, that if the doctrine was intolerable, Pythagoras would have been at least reprimanded by the Inquisition? "It may be called the theory of Nicolas de Cusa, since he revived it; he was born in 1401, and was made Cardinal by Pope Eugenius IV in 1448." The wording of the sentence almost seems to ask us to believe that he was made Cardinal *because* of the theory!

Nicolas was a great man and was at one time in some danger on account of his keen observations relating to certain delicate matters, the False Decretals, the Donation of Constantine, and the superiority of councils to popes. But he turned about so thoroughly and became so earnest an advocate of papal supremacy that his heliocentricism, a mere side issue in his philosophy, was readily overlooked—as almost everybody else was overlooking it.

It was the theory of Copernicus; from him it gets its name. . . . Copernicus dedicated his great work on the revolutions of the heavenly orbs to the reigning Pope, Paul III, in 1543, five years before Bruno was born.

The letter omits to mention two little facts:

First, that Copernicus died the same year, stricken with paralysis, before anything could be done with him.

Second, that about 70 years later, in 1616, the Holy Office came down thundering upon the whole proposition, censuring as utter heresy the teaching that the sun was the center and that the earth revolved on its own axis. The teaching was Galileo's; at him the thunder was directed; and he was required to recant under threat of torture. He did so, but was ordered to be imprisoned and to recite the seven penitential psalms once a week for the next three years. But that of course could be done at the eyepiece of a telescope.

From which we can see what probably *would* have been the fate of Copernicus, had he lived. The theory was not the only cause of Bruno's burning, however.

The Congregation gave twelve reasons for burning him. The first was that he taught the plurality of worlds. Then he taught Reincarnation; then that "magic"—by which he meant operative knowledge of the hidden laws of nature—is a good thing; fourthly, that the Holy Ghost is the World-Soul, and, fifthly, that Moses said so; sixthly, that the world is eternal; seventhly that Moses understood magic; and, eighthly, himself thought out the laws he gave his people; ninthly, that the Scriptures should be in the hands of all; tenthly, that the Jews had a special origin from Adam and Eve, distinct from that of other races; eleventhly, that the devil will be saved; and lastly, that Jesus was not God but a man who had attained knowledge of "magic."

Some of these, it need hardly be said, are mere caricatures of Bruno's profoundly philosophical teachings. But they had to be caricatures to make a case that should cover his real offense. Which was, to teach that the soul of man is a divine monad, standing between the *purely* divine, and matter; whose duty, while acquiring experience in matter, is to reach upward to the divine by its own inherent powers. *The priest had no place in the scheme*, and that was the real cause of the indictment, the imprisonment, and the burning. No glosses can blur that fact. The Church burned a great liberator of humanity and must take the Karma. H. CORYN, M. R. C. S.

# Some Views on XXth Century Problems

## Unexplaining Explanations

**A** SCIENTIFIC contemporary lifts the veil of Isis according to twentieth century methods and shows just how the tricks of the Hindû fakir are done. Their simplicity is absurd. Why on earth did we not think of it before?

For instance the basket trick. The little boy is put into the basket; a cloth is thrown over; the basket is stabbed through and through with a sword; the boy presently appears from somewhere; the basket is found empty.

Nothing is easier. The basket is shaped like a fat squat teapot with a relatively small mouth. The boy lies inside coiled around the edge; the sword, being stabbed in vertically through the mouth, of course leaves him untouched. Another boy appears from somewhere.

In the actual trick the basket is actually found empty; the "explanation" omits this, represents the substitute boy as getting out of sight somewhere, and then makes the original boy come out of the basket. To stand at all, it had (a) to omit the fact that the trick is done on no well-appointed platform, carefully lit, but in the open air amid a crowd of people; (b) to make the basket of a special shape whose purpose would be instantly obvious; (c) to have the stabbings carefully vertical; (d) to omit the fact that in the classic performances of the trick the boy is *not* afterwards in the basket at all; and (e) to represent the audience as semi-idiotic.

The mango-growing trick is similarly "explained." For small trees the fakir places in the ground a dummy seed in which he has previously folded up the tree and leaves. Over this he places a cloth, passes his hands beneath and unfolds the tree. For larger trees we have this:

The conjurer has a large tree concealed beneath a thick cloth, a duplicate of the cloth he uses to cover the seed at first. After uncovering the seed several times, and showing it grown more and more, he uncovers it for the last time, and, while the audience is gazing at the plant wonderingly, the conjurer takes occasion to exchange the cloth for the one containing the big tree [!] underneath it.

Besides assuming an idiocy of the audience, who never notice that under a second cloth is a "big tree" with fruit on it, the "explanation" requires that the performer shall put his hand underneath the covering cloth and manipulate for some time. But in the classic performances he stands apart and the growing manages itself; moreover he hands the seed around before he plants it; when it has grown he hands around the little shrub resulting—of which one moment's examination would show whether it had been crammed like a bullet into a hollow seed.

The classic performances of these tricks have been witnessed again and again and fully reported for a century and a half. Such performances are not trickery in our sense of the word, but are the last flickers of an ancient art—*magic*. We have agreed that there never was any such art, any such tran-

scendental knowledge of and working with the subtler laws of nature. The unquestioned belief of all the ancient peoples for uncounted thousands of years, and of most peoples today, rested on nothing but the trickery of the medicine-men. Luckily, try as we may to keep our heads buried in the sand, *the sand is blowing itself away!* We are getting a horrible view of relentless truth in full pursuit of us. Magic, the Wisdom-Religion, Reincarnation, Karma, a civilized Atlantis and even Lemuria, a limitless perspective of civilizations—alas, upon what days are we fallen! STUDENT

## The Coy Pickaxe

**T**HE professorial researchers who are "listening to the pickaxes" of their comrades on the other side—as they phrase it; listening *for* the pickaxes would be a small but important improvement in the phrase—must already be aware not only of their difficulties, but of a—to them—very formidable danger. Nor will they save themselves from it by a careful sifting, before publication, of the "messages" they get. Pure twaddle coming through their own medium, into their own guarded circle—as for example these lines ascribed to Mr. Myers:

Friend while on earth with knowledge slight  
I had the living power to write;  
Death tutored now in things of might  
I yearn to you and cannot write.

—can be withheld from the gaze of a not too respectful public. But other, unauthorized, circles, mediums, and automatic writers, are listening for the very same pickaxes; are, as they think, hearing them; and are doing no sifting before publication. Imitation was inevitable; and so therefore is ultimate general ridicule of the whole method.

No one who has studied the literature of "communications from the departed" can have failed to be struck by one general characteristic: the ingenuity with which the "pickaxes" evade a cross-examination which would demonstrate their non-possession of any real knowledge. The ingenuity is relative, relative to the intelligence of the circle. It adopts various methods. Sometimes there is great dignity: the questions are impertinent; the witnesses proudly decline definitive tests. They demand a becoming humility. At other times the knowledge they possess is beyond the low incarnate intelligence.

But when the listeners cannot be bluffed in either of these ways, and, as in the case in hand, are men of science with a becoming estimation of their own intelligence, the method changes. The "pickaxe," still claiming the knowledge, ascribes the non-communication of it to the essential difficulties of the situation, or, quite modestly, to its own lack of power. Here is an example, purporting to be from Mr. Gurney:

The nearest simile I can find, to express the difficulties of sending a message, is that I appear to be standing behind a sheet of frosted glass—which blurs sight and deadens sounds—dictating feebly—to a reluctant and somewhat obtuse secretary. A feeling of terrible impotence burdens me—I am so

powerless to tell what means so much. I cannot get into communication with those who would understand and believe me. [Here the note changes into one with which we are more familiar]. You need much training before you can ever begin to help me as I need to be helped, and I do not know how that training is to be arranged for.

The upshot is as usual; no real information is to be forthcoming. Yet it should not be so hopelessly difficult at least to give a pointer. Here is (hypothetically) a philosopher talking, with whatever difficulty, to philosophers. Can he say *nothing* illuminating? No word or *hint*?

But if this method is going to prove futile and perhaps in some ways disastrous, there is another open to every one of the experimenters. There are blows, genuine ones, of a pickaxe to be heard. There is something "on the other side" trying to communicate; but it is, as it were, on the other side of the individual's brain, the upper side. Why do not men of science investigate that, each for himself; as to which the testimony of all ages and peoples is invariable? At birth the purely divine and almost all-knowing soul of each of us pushes a ray of itself as it were *through* the brain into the senses and animal sense-consciousness. That, so housed, develops into the mind and the sense of personal selfhood, still remaining in slenderly-channelled relation with its source.

Dropping the simile, the mind, to re-blend itself during life with the soul, must throw itself into some state of consciousness common to both, making that the steps of its ladder. In proportion as this is done, the mind comes into real knowledge of what is "on the other side"—of the brain and of death. For it is on *this* side of death that conscious knowledge of the other side must be got. Death cannot give the mind knowledge. It gives rest, bliss; it prepares for renewal of effort. It is a garnering, not a sowing.

The state of consciousness which becomes the key, the ladder, is love, compassion, the *feeling-with*. This is absolutely the one path to wisdom. He who would know must learn to feel with the world, feel himself of one life with the world. He must feel compassion, in its more limited sense, with those who have less than himself of joy, less than himself of light, more than himself of pain. Compassion is brotherhood looking as it were downward; reverence is brotherhood looking upward to those whose spiritual light is greater. There must be sense of profound unity in every direction. This is the actual light of the soul, thus made to burn up in the mind. The intenser its production, the sooner comes wisdom; and in no other manner comes wisdom; in no other way can mind actually get knowledge of the spiritual physiology and geography of life. Such a statement would sound like dogmatism were it new. But it contains the teaching of every Founder of the great religions by which the world's millions have lived and died. The researchers might as well consider it; for if it is true they will now learn nothing; if it is true they are men studying astronomy by gazing at the stars through the bottom of a tin can. STEPS OF THE WATA DAGE, POLONNARUWA, SHOWING MOONSTONE AND NĀGA DVĀRPĀLA STONES

## Viking Ship 1100 Years Old

THE curator of the Christiania Museum has communicated to the Académie des Inscriptions et Belles Lettres an account of the discovery of a Viking funeral ship, believed to be at least 1100 years old. In its mortuary chamber were the bones of two women who judging by the appointments of the vessel, had evidently been people of note. The ship was seventy feet long and sixteen and a half wide; and was dug out of a tumulus two and a half miles from the shore. It had evidently been visited before at some remote period, and most of the treasure removed—"pillaged by unscrupulous visitors," as the account says; but in other parts which had escaped the notice of these supposed robbers were found many historic remains, including a four-wheeled chariot richly decorated, four carved sledges, several beds, a mill, spinning wheels and kitchen utensils; the character of which leads to the conclusion that they belong to the Ninth century. The ship, after being restored, will be placed in the Museum,

in the care of people who, it is to be hoped, will prove more scrupulous than the earlier visitors.

## Carved Steps of the Wata Dage

IT is thought that the Wata Dage ("Round Relic House") may have been built as a receptacle for the Sacred Tooth, which was probably removed for safety from Anurādhapura to Polonnaruwa during one of the Tamil invasions of Ceylon towards the close of the Twelfth century. On each side of the foot are seen the door guardians, or *dvārpāls*, which were always stationed outside sacred shrines. The term *nāga*, or "snake," is applied to them on account of the cobra's hood which is spread over the head of the figure, just as, according to tradition, the King of the Cobras spread his hood to give refreshing shade to the Lord Buddha when the latter wished to meditate. Although curiously carved figures are still placed on the outside of sacred buildings, even in modern western lands, in deference to old usages which the

intuition urges us to keep up even if the reason no longer comprehends: one often hears the same practice, as followed in other lands, described as superstitious. But it is reasonable to suppose that though we do not understand why we perpetuate so many of our ancient ceremonies and architectural forms, there may have been people who did understand. The act of placing a statue as guardian symbolized the actual setting of a guard for the inner Self, which preserved the sacred "atmosphere" of that shrine; and nobody but the ignorant would confound symbol with symbolized.

At the foot of the stairs is also seen a "moonstone," a semicircular stone found at the foot of flights of steps in nearly all the Ceylon ruins. Though the general design is always the same, the details differ. Usually the outer rim represents a procession of the elephant, the horse, the lion, and the Brāhmany bull; the next two or three circles bear designs of the stem and leaf of the lotus; inside these is a procession of the Hamsa; and finally lotus flowers and buds. STUDENT

# ✻ The Trend of Twentieth Century Science ✻

## Physiological Evolution

**A** GERMAN physiologist, speculating somewhat heavily concerning the man, or rather the body of man, of the far future, altogether misses an evolutionary possibility. The motor mechanism of the body consists of muscular fibers of two distinct kinds. One, highly evolved, cross-striped under the microscope, comprises the muscles that are under the control of the will. The man who wants you to feel his biceps is proudly calling attention to a mass of such.

The other, on a much simpler and less evolved plan, comprises the muscles that are not controlled by the will—those lining the intestines, forming one coat of the blood-vessels, and bound up in the glands and viscera.

But the distinguishing mark, control or non-control of the will, is not absolute. It is true that we can cause contraction at will of the voluntary muscles; but on their own account they keep up a slight firm contraction all day long, so as to be ready when called upon. And of course the whole matter of their nutrition and growth is their own secret and their own affair.

On the other hand the involuntary muscles are to some extent under the control of will. The man who suddenly "braces up" to face some task or difficulty, causes an added tension of them, a veritable contraction, throughout the whole body. If he lies down flaccidly and "lets go," they relax. This feeling of bracing up is on a general scale exactly what we have to create locally for any given voluntary muscle to get it to contract. The man who makes you feel his noble biceps has done this with respect to one muscle very vividly and consciously.

May it not be, since the difference is thus by no means absolute, that the simply-made, unstriped, involuntary muscles, which in some of the lower organisms are all there are, are in man on their way to the other sort, the striped voluntary? When that time comes, man will have complete control over his body and will be much more highly evolved in all ways than now. Seeing what he does with the forces and processes that are under his control, seeing that he hardly ever makes even an objective invention without immediate examination of its possibilities for killing his fellow men, seeing that if he could find the real secret of hypnotism he would immediately use it to gain selfish and sometimes infamous ends—we may be quite sure that the finer forces of his physical life will not be delivered into his hands before the right time. His physical nature must wait for his moral growth. Till he has learned to behave himself, his control of his own body—which is an epitome of all forms of substances and their forces, must remain very crude.

## Evolution Among the Stones

**G**OLD is gold the world over, says the practical man; and so it is. But there may have been a perplexing time when it was not, and this time may come again. Even now, the gold of Australia, identical in

every particular accessible to the examination of chemists, with the gold of California, is yet much lighter in color.

In the animal and vegetable world, species are pretty definitely marked off from each other. The intermediate gradations have disappeared, or nearly so. They tend, perhaps, to reappear, in the small present-day variations, which skilled inspection can always find. If we could bring up past time into line in the present, we might have the whole series of minute transitional steps visible before us.

Everything points to the same state of things in the mineral world. The elements of chemistry correspond to the species of the botanist. They show—a fact not often mentioned in the chemistry text-books—the same tendency to vary a little on either side of a mean. The slight difference in basicity; a slight difference in the spectrum; a slight reluctance to precipitate; and so on. If we consider the case of two elements standing close together chemically, and could compress past time on into line with the present, we could probably find all the intermediates. Now, a hint only of the past existence survives as these variants, the "meta-elements" or "elementoids." And chemists are now agreed that the whole lot have gradually integrated from a protyle, whether that be the electrons or a form of substance yet subtler.

If then there is evidence that the elements are even now unstable and changing, it would seem likely that they have been more so in the past. And therefore that the matter we now study is not the matter of the past. A chemist of today who was transplanted back say twenty million years might be extremely puzzled at what he found. Hardly an element with which he was familiar might be recognizable. On his return he might warn his brethren to be more modest in their constructions of past geological history. For if the elements have changed, so may the forces working through and by means of them.

And if there is a protyle, a root-base, from whence all the elements have evolved, having no similarity to any of these its compounds, why not also a root-force, also having no similarity to any of the forces that have come from it? This would be the *Fohat* of Theosophy, Cosmic Will, conscious and intelligent.

STUDENT

## Radium and the Continents

**N**OBODY could have imagined a few years ago, when the Curies extracted their little particle of radium, that it would ultimately give rise to a theory of continents and oceans. But such a theory found expression from Professor Joly in his address on geology to the British Association. It now stands as a competitor with the theory of Professor See. They are quite antagonistic; for whereas the latter's is as it were an answer to the question why the continents do *not* sink and exchange places with the oceans, the former's is an explanation of why they *do*. Since they do, Professor Joly's theory seems to start with a pretty manifest advantage. It requires that they shall; the only questionable point

is the mechanism he postulates. Putting it very briefly for the present, merely by way of contrast with Professor See's, it ascribes the motive to radium, or rather to radium's parent, uranium. The latter, in becoming through various stages radium, and radium in degenerating through its further stages, generate heat. These changes, according to the theory, are the causes of the earth's heat. The crust, charged with these degenerating metals, gets hotter in the proportion of the square of the depth. It therefore tries to expand, and in the relief of the tension finally throws up mountains and continents. These, charged with radio-active matter, are washed back little by little into the ocean. At last the rising heat in the ever thickening ocean bottom causes it to be raised in its turn, and now the ocean lies on the old continent. So goes the sea-saw. Atlantis goes down; Europe and America come up. Later, parts of Atlantis come up; parts of the others go down.

But Professor See's theory must make the continents permanently growing in area, while the ocean grows permanently in depth. The weight of the deep water forces it through into the deeper hot layers of the subjacent crust. An explosion follows, and hot lava is forced sideways from beneath the bottom towards the edges where the weight of water is less, throwing up coastal ranges. The process being repeated and repeated, means that the continents are always growing at their edges. Which, sometimes, they are; but sometimes they are not. And once in a while a whole continent goes under, or one comes up—not accounted for in the theory.

But no mechanical causes will ever prove sufficient to explain the earth's behavior; incidental instruments they may be, and are; final causes they are not. For the earth is alive.

STUDENT

## The Puzzle of Tuberculosis

**T**HE great attention recently concentrated upon tuberculosis has served to bring out some facts that appear to place the disease in a class almost to itself. The Swedish government thus condenses the facts:

Whereas in Sweden, as in most other civilized countries, the general death-rate has been declining throughout the last decades, "the mortality due to consumption has everywhere remained stationary, our own country not excepted." Thus during the 20 years ending 1905, the general Swedish deathrate fell from 25 (country) and 29 (cities) to 16 and 17 per thousand. The tubercle deathrate fell for a time in about the same degree; but since 1890 has been stationary. In the same year, 1890, our own deathrate from that cause was 163; with the exception of two or three years it has been more than that ever since.

A (future) "serum" may seem to help; improved social and industrial hygiene will actually help. But in the same way as the dyspepsia of a man who habitually ate twice too much might be helped by cooking his food better. For the root of tuberculosis lies deeper—in the individual's conduct of his life and use of his vitality.

## Nature

## Studies

## The Architects of Nature

IN connexion with the recent meetings of the British Association for the Advancement of Science, held this year at Dublin, a lecture (of the more popular kind) on "Crystallization of Water" was given. The purpose was to show that water is a crystallizable substance and that ice is crystalline in structure instead of being an amorphous mass.

The lecturer showed lantern pictures of frost figures on glass, and called attention to the beautiful fern-like forms with which everybody is familiar on the window pane. He also showed snow crystals, another familiar phenomenon, and dwelt on the beautiful hexagonal designs which they make. It was shown that snow crystals could be imitated by evaporating a solution of magnesium ammonium phosphate.

Surely it is a very marvelous fact that the atoms of mineral substance should be able to build themselves into forms of such wondrous beauty, and that such consummate design should be present everywhere in the "inorganic" world! One fears that students of science often get so absorbed in tracing out the details of the processes that they lose their appreciation of the significance of these wonders. The "argument from design" is an old familiar weapon in the armory of religion when arrayed against science to champion a God whom science may be supposed to have denied. What but an almighty power could have accomplished such a wonderful and universal order and beauty?

True; we cannot conceive of dead atoms accomplishing it all, even with the help of blind forces to drive them. There is mind at work in creating all these forms, as there are minds to view them and to talk about them. But—let us beware how we profane the conception of that Divine Power by attributing to it our limitations and our weaknesses. Look at the world of nature with all its infinite variety, beauty, order and ingenuity; its unfathomable skill, adaptation and perfection; its sights, sounds, colors, and odors, that charm our outer senses, its subtler enchantments that enthrall our inner senses; and ask yourself if that is the kind of work likely to be produced by the theological God. Nature has its vastnesses, but none so vast as the gulf between the alleged artist and his work; there is not room for the

Lomaland Photo. and Engraving Dept.

OFFICIAL RECEPTION TO ADMIRAL SPERRY, SYDNEY, N. S. W., AUSTRALIA  
(Photograph by Davies, Sydney)

two together at once in the mind. And, besides this God, we have "Nature"; and what is that but another God whom we worship and neglect and fear and scoff at, just like the other God? What *do* we mean when we talk about Nature and Nature's wonderful work?

We have not the sense to see that we have been worshipping at least two Gods; and a more discerning mind might easily add a few other Gods, such as Mammon, Self, Ambition. We are so proud of

Unity. For the latter doctrine holds there is One eternal Source of all being, but does not deny that it may include innumerable lesser Powers within Itself.

Logic forces us to recognize this, but we save our face by calling the minor Gods "forces," or "Nature" as aforesaid. But there is an indissoluble connexion between forces and mind; for as mind generates forces, so forces are generated by mind; there are not two sorts. The forces that operate in Nature are *intelligent*; if this be not granted, it is necessary to suppose that without being intelligent, they can yet produce the same results that intelligence produces. We must choose between this position and that other (more logical?) one—that even our own intelligence is itself mere mechanical force! But why all the energy that is expended on trying to prove the universe is mindless? STUDENT

## Wild Cattle in England

CHILLINGHAM Park, Northumberland, with a fine castle dating from the Twelfth century, is famous for its herd of wild cattle. This herd, and another in Cadzow Forest, Lanarkshire, are the only two herds of pure wild cattle now existing in Great Britain.

The Chillingham cattle are of a pure white with black muzzles, parts of the ears red, and white horns with black tips. At one time there were herds of wild cattle at several country seats, but they have died out through interbreeding or by being killed off. At Leigh Park the cattle were so dangerous that the owner, early last century, had them all destroyed. These animals are fierce and pine away of mortification if they are captured. They are remnants of herds that once roamed all over England. H.

## Wordsworth

WE owe a debt to Wordsworth much greater than most of us are able to appreciate. For by his intense love of Nature and his real sympathy with all natural beauties he was one of the great forces that rescued us from the artificiality and shallow cynicism of 18th century culture. It is easy to pick holes in him now, for he was not the Sun, but just a humble planet; it is these pioneers that do the most work and meet the most criticism from those who reap the profits. STUDENT

## DREAMS

N. R.

**I**DLY I sat in the twilight of day  
Weaving a dream, as the light crept away.  
Elf-gold is glittering, elf-jewels gleam;  
I eagerly fashioned them into my dream.

I wove while the daylight was dwindling in night;  
I wove as the darkness turned back into light:  
Alas! when I watched for my dream coming true—  
The elf-gold was straw and the jewels were dew.

Weaving a dream, in the starlight I lay;  
My Soul chose the dream-stuff that came in my way:  
Sharp-piercing thorns from an unending stream;  
I wove them, though heart-bleeding, into my dream.

Rough-edged stones did I polish with pain;  
My Soul urged me on through darkness and strain.  
Submissive I waited my dream, and—behold!  
The thorns and the pebbles were diamonds and gold.

## Some Further Paradoxes in the Light of Theosophy

**T**HE knowledge of Self is Wisdom, but this means more than the words convey in their ordinary meaning. William Q. Judge, the predecessor of Katherine Tingley, said that:

There is but one way to open the heart: that is by living the life. If you desire to help humanity then you possess the true motive. If you use your will in this cause, Wisdom, Peace, and all the powers will be given.

Theosophy teaches that when the life of self-discipline is seriously entered upon, an inner light begins to shine through the darkness, and the Way begins to be seen more and more clearly at every step. This is not what is sneered at as "mere morality," an expression implying presumably, a whited sepulcher of hypocritical respectability. Theosophic teachings, including the noblest utterances of the sages of antiquity, among whom we include Jesus, repudiate the effort to obtain personal salvation regardless of the fate of the rest: the hideous ideal of a heaven from which a few would admire the eternal punishment of the lost unbelievers as a pleasure, is a nightmare bred from the quintessence of selfishness crossed with the crudest mockery of holiness, and although this has become almost too absurd for acceptance today, the spirit of self-righteousness is still alive and is one of the enemies with which Theosophy has to deal.

The paradoxical result of the impossible attempt of the theologians to combine the Hell-fire doctrine and Jehovah's vengeance upon his unfortunate creatures with the practical rule of life ordained by Jesus when he said to the people "Forgive your enemies," is well illustrated by an amusing story of a dear little Sunday-school boy, who had a very pious mother. He had been ill-treated by a school-mate and vowed that he would "make it hot" for him next time. The well-meaning

mother remonstrated and reminded him that Jesus never "made it hot" for his enemies. The small boy admitted this argument, but quickly remembering what he had been taught about the vengeance of God, said: "No he didn't, but he's going to!"

Theologians in their insistence upon the so-called "Plan of Salvation," have reversed the beautiful and simple gospel of Jesus Christ, for he taught that the leading of the life was the first necessity, which would be followed by the comprehension of the scheme of the universe; for there is a voice within which is ready and anxious to teach if we will but still the voice of our desires and passions. Jesus said: "If any man shall do his will he shall know of the doctrine." There is no dogma there.

But Theosophy has an immense trust in the future of humanity, for it knows there is a divine plan leading upward and onward, however difficult the road may be. We are not born here for the first time into a world of blind chance, or one ruled by a capricious Deity made in the image of man, who repents of his work and has to patch it up. As Wordsworth says: "Not in entire forgetfulness, and not in utter nakedness, . . . do we come." All nature is the image of the mighty Plan of progress inherent in the core of the Universe, the Plan which is leading every atom onward through diverse experiences toward self-consciousness, and then into Divine consciousness and Unity. Progressive Reincarnation is the only logical method by which this end can be attained, and Theosophy offers a system coherent, rational, and impregnable.

The Theosophical Society was formed by Madame H. P. Blavatsky with this basic unity in view, this Universal Solidarity, and when its Constitution was finally consolidated, adhesion to the first and fundamental object was made compulsory on all members; *i. e.*, the formation of the nucleus of a Universal Brotherhood. The study of religions and philosophies, scientific research, or the intellectual investigation of the hidden powers in man, were made optional. The studies of human nature, of history, of science, and art, are conducted by the members of the Society upon the original lines laid down by H. P. Blavatsky, *i. e.*, with the aim of understanding more perfectly the world we live in so as to be better able to help our fellows, not for self-centered enjoyment in gaining general information, for time is precious, and the demand for Râja Yoga education made upon those members who have qualified themselves not only by their intellectual knowledge but by their moral character both for the acquirement and the imparting of the true wisdom of life, is growing faster than it can be answered.

Under Katherine Tingley's leadership the practical work of teaching this human solidarity which was H. P. Blavatsky's primary object in forming the Society has been strongly accentuated, and the result has been the great increase in the spread and influence of the Movement in consequence of the clear demonstration that Theosophy is a sane altruism, and that the only reason for its existence is the benefit of humanity. This includes all aspects of Man.

But the strangest paradox of all, one which those who are really interested will find great profit in examining, is that Theosophy—so

much dreaded for its supposed destructive tendencies, the so-called terrible heresy of the age, so much misunderstood that every possible effort, scrupulous and otherwise, has been made to destroy its beneficent influence through the vilest personal attacks upon its teachers—should be the only system of thought before the world capable of defending the Bible and the other world-scriptures from the attacks of the iconoclasm of the day which would in its ignorance destroy what it can never rebuild. To illustrate what is meant, take the stories of the Tower of Babel, or the account of Jesus directing his disciples to rent a room belonging to a man who carried a watering-pot! On the surface, the Tower of Babel story seems preposterous, and when we find it also in Babylonian inscriptions of enormous antiquity, the Higher Critic says: "There you see, it is but a fanciful legend of the Babylonians from whom the Jews derived it"; and why Jesus should specially have chosen the house of a man bearing a watering-pot is utterly unknown to the theological student of ordinary training. Yet both stories have profound meanings. The Babylonian Tower of Babel story is exactly duplicated in Central America, but the *Tower* is the *Pyramid* of Cholula, and the *House* of the Watering-pot story has an astronomical significance of importance in the study of the cyclic periods of the manifestation of the Divine Principle once manifested in Jesus, the Initiate of Nazareth.

Theosophy has an immense patience, for it has good reason to know that the paradoxes and horrors of this age will some day melt away under the gentle warmth of universal brotherhood in practice. Râja Yoga education—the perfect balance of the physical, mental, and spiritual—Theosophy in practice—which is not the *invention* of any human being although it was brought forward by Katherine Tingley in our time, is the application to present needs of the very basic principles in Nature, by human beings. Râja Yoga education, as it spreads farther and farther, is becoming a leading and permanent feature in the world's affairs, as it draws out the latent good in human nature, enforcing the highest moral code upon teachers and pupils, starving the ugly weeds, and laying firm foundations upon which the little suspected glories of humanity's greater self will rise to undreamed-of heights in the Golden age to come. C. J. R.

## Faith

**T**HE quality called Faith is based on knowledge received through intuition (a faculty beyond and above mental processes, which gives direct perception of Truth), and it manifests as a steadfast attitude of the mind unfalteringly sustained for the end in view. It brings with it all that is positive in action and attitude, and implies the absence of doubt and the waverings and uncertainty of mind. From it grows gradually the acquaintance with that boundless bliss which is not connected with objects of sense and where one is not moved from Reality.

Faith is the positive attitude assumed towards the Outward, which proceeds from the accession of inner knowledge of Light from Within.

"The embodied soul being gifted with faith, each man is of the same nature as that ideal on which his faith is fixed." H. C. B.

# THEOSOPHICAL FORUM

Conducted by J. H. Fussell

**Question** What is the personality, of which so much mention is made in Theosophical writings, and why is distinction made between it and the soul?

**Answer** I. We are not entirely immortal are we? Yes, that is a perfectly fair question to put to anyone; you, whatsoever you have made of yourself, are well capable of answering it. For think: you cannot conceive that your present partiality for this or that kind of food is going to live with you forever. You would surely not be content to put up eternally with that habit you have of losing your peace whenever So-and-so laughs too loudly, or some one else slams the door. Are there not a thousand and one things woven round your consciousness, which yet you feel you will not carry through the ages? Which you feel, perhaps, would drop away should some grand crisis come upon you, and be forgotten for the time being at least.

*Persona*, the thing we sound ourselves through, the mask we use for our disguise—on this all-the-world-stage—that is what the personality is. Are the clothes the man? You answer that they are not; at least, not as a rule. We do find people who live in and for their clothes, completely surrendered to the outward apparel; we do find tailor-made men and women; bodies disguised by clothes, and minds running and trailing over their garments like a vine over a tree. Such men we do not hold of great account, although slovenliness is next to ungodliness. But how many yet hang on their inward layer of garments—body and brain, likes and dislikes, partialities, fears and passions! These are not the man, any more than the clothes are the man. Let a man be only these things, and we recognize in him merely a kind of shell; put him against danger, let great issues depend on him, and what will be the result? When we speak of a *man*, in italics, we do not think of a creature of this type; but of one with the bedrock of being in him, true, honest, and alive. Better indeed go further, and say also *compassionate*; say a man living for others, one conscious of world and national needs, and alert to meet them.

It is the fashion of the day to pick out the personal marks and habits of the great, advertising what they eat, how they sleep, and their failings, if any; that is because we are all for personality these days, and can recognize greatness hardly. We might say that the greatest men are identical with some great idea: thus Joan of Arc was France; France lived and breathed in her; rose up in her, and purged itself of its enemies. We will instance also William Q. Judge, who did more than stand and toil and battle for Theosophy; he *was* Theosophy. There was this huge necessity of infusing the spirit of altruism, of compassion, of sane living into the world's life; and while the breath was in his body, that huge necessity was embodied in William Q. Judge. However much the spirit of the age might beat upon him, it was bound to be baffled and driven back; it could not change his purposes. It was no matter of winning anything for himself; *persona*, the mask, body and brain and egotism received no homage nor sacrifice. He lived because it was im-

perative that light should come to the world.

Now it is only this *persona* that keeps us apart, and in it are lodged all the seeds and elements of selfishness. The soul, whenever it looks out, recognizes in all men its brothers: take nothing for true soul-outlook, that is not marked by this recognition. All the conglomeration of the world's difficulties are locked up in the personalities of men. We are under the thumb of our peculiar views, desires, ambitions, private aims; even our bodily tastes and cravings. These we strive after, and as they are all conflicting, we incessantly come into conflict with each other. We ought to think whether we *are* these things, or are merely pestered and domineered over by them.

There is the body; but we are not that: because we could direct it to do as we will, were we not somewhat out of practice in the matter. So too we are not the cravings and appetites and partialities, for all these things can be changed and altered by our own effort of volition. Watch your mind, and observe the mill-race of trumpery thoughts passing through it, apropos of nothing in particular. Stop now, this very instant, and pick up the last floating thought; see what came before and gave rise to it, what to *that*; what (if you can go so far) to the last fifty or sixty—and say whether you care to consider yourself merely the duct for such a miserable flow? You do not? Then what are you? The one that looked on at those things passing—looked on between waking and sleep, drowsing, eyes half shut, while that jumbled rag-tag pageantry anticked its way before you. Looked on and lost yourself in it; forgot your identity, like a spectator in a theater, when what passes on the stage becomes the only real existence, and all outside matters are in oblivion and hidden.

Awake, realize your own being, turn away from these puppets and fool's play; and what you will find yourself to be will astonish and exalt you.

T. H. V.

**Answer** II. This question, which is really the question "Who am I?" "What is this 'I' that thinks and feels and acts?" is the most important that each one has to face. Answer it, come to know yourself—and this means much more than the intellectual conception, for there is that in man higher than and beyond the reach of the intellect—and the key will be gained to all knowledge.

This is the reason why this subject is so fully treated in Theosophy; and it is in Theosophy alone that the answer is to be found.

In a brief answer to the question, but a few hints can be given for further study. First, however, a word should be said in regard to the use of the term *soul*. It is evidently intended by the writer of the question to refer to the permanent essential man, in distinction to the personal transitory man, but the term *soul* has many meanings.

In Theosophy distinction is made between the Spiritual Soul, the Human Soul, and the Animal Soul—the first imperishable, immortal; the second with power to win its immortality; the third an instrument merely. The term used in Theosophy in contradistinction to "personality" is "individuality," and it is employed to denote the immortal, real man who passes from life to life, like an actor

playing many parts, now appearing as Hamlet, now as Macbeth, now under another name and guise, but remaining himself the same throughout—but with this difference, that the individual man, the immortal, spiritual soul, unlike the actor, creates his parts, and is responsible for them. This guise under which the soul is hidden, the part it plays in any one life, the vesture of intellect, desire, and physical nature in which it clothes itself, is the personality through which it reaps experience and through which it contacts the outer life and does its part of helping or retarding the progress of all nature.

The student who wishes to pursue this subject is advised to study *The Key to Theosophy* by H. P. Blavatsky, especially sections VI to X; and the Theosophical Manuals, No. 2, *The Seven Principles of Man*; No. 4, *Reincarnation*; No. 5, *Man After Death*; No. 12, *The Angel and the Demon*.

Regarding the new personality with which the ego is clothed each time it enters into earth life, H. P. Blavatsky says:

The new "personality" is no better than a fresh suit of clothes with its specific characteristics, color, form, and qualities; but the *real* man who wears it is the same culprit as of old. It is the *individuality* who suffers through his "personality." And it is this, and this alone, that can account for the terrible *seeming* injustice in the distribution of lots in life to man. When your modern philosophers will have succeeded in showing us good reason why so many apparently innocent and good men are born only to suffer during a whole life-time; why so many are born poor unto starvation in the slums of great cities, abandoned by fate and men; why, while these are born in the gutter, others open their eyes to the light in palaces; why a noble birth and fortune seem often given to the worst of men and only rarely to the worthy; why there are beggars whose *inner* selves are peers to the highest and noblest of men; when this, and much more, is satisfactorily explained by either your philosophers or theologians, then only, but not till then, you will have the right to reject the theory of Reincarnation. The highest and grandest poets have dimly perceived this truth of truths. Shelley believed in it, Shakespeare must have thought of it when writing on the worthlessness of Birth. Remember his words:

"Why should my birth keep down my mounting spirit?

Are not all creatures subject unto time?  
There's legions now of beggars on the earth,  
That their original did spring from Kings,  
And many monarchs now, whose fathers were  
The riff-raff of their age. . . ."

Alter the word "fathers" into "Egos"—and you will have the truth.

STUDENT

THE inner Ego, who reincarnates, taking on body after body, storing up the impressions of life after life, gaining experience and adding it to the divine Ego, suffering and enjoying through an immense period of years, is the fifth principle—*Manas*—not united to *Budhi*. This is the permanent individuality which gives to every man the feeling of being himself and not some other; that which through all the changes of the days and nights from youth to the end of life makes us feel one identity through all the period; it bridges the gap made by sleep; in like manner it bridges the gap made by the sleep of death. . . . This permanent individuality in the present race has therefore been through every sort of experience, for Theosophy insists on its permanence, and in the necessity for its continuing to take part in evolution. It has a duty to perform, consisting in raising up to a higher state all the matter concerned in the chain of globes to which the earth belongs.—W. Q. Judge

# THE UNIVERSAL BROTHERHOOD AND THEOSOPHICAL SOCIETY

FOUNDED AT NEW YORK CITY IN 1875 BY H. P. BLAVATSKY, WILLIAM Q. JUDGE AND OTHERS  
REORGANIZED IN 1898 BY KATHERINE TINGLEY

C e n t r a l   O f f i c e   P o i n t   L o m a   C a l i f o r n i a

The Headquarters of the Society at Point Loma with the buildings and grounds, are no "Community" "Settlement" or "Colony." They form no experiment in Socialism, Communism, or anything of similar nature, but are the Central Executive Office of an international organization where the business of the same is carried on, and where the teachings of Theosophy are being demonstrated. Midway 'twixt East and West, where the rising Sun of Progress and Enlightenment shall one day stand at full meridian, the Headquarters of the Society unite the philosophic Orient with the practical West.

## Astrology

A PAPER states that in England an "astrological society" is running a scheme of astrological scholarships for children. Parents are to send in particulars of births, and the child whose horoscope is adjudged to be the best gets a scholarship in cash. The paper indulges in some light remarks on the saving of trouble in education that might be supposed to come from the practice of casting children's horoscopes.

From what one knows of modern astrology, there is not much danger of a millennium coming about through the efforts of this cult. Even granting invariable skill and care on the part of the astrologers, which is making a generous concession, the data at their disposal are too scanty to afford a basis for predictions of any real value; and for the most part the results which they predict are modified or overruled by influences which they are unable to estimate. The forecasts consist mainly of generalities about character, such as are also made by palmists, graphologists, etc., and which are not distinctive or detailed enough to be described as either true or false. One has met cases of delineations being published from wrong horoscopes, the mistake being afterwards admitted; needless to say, any real knowledge should have enabled the astrologer to know that his figure was wrong.

The only zodiac used is the solar ecliptic one; and the only division of this recognized is the division into twelve houses. The degrees are used only in measuring angular distance, and have no certain value of their own. Lunar mansions and other divisions are practically unknown. By most astrologers the ecliptic longitude of the planet alone is considered, and to some small extent the ecliptic latitude. The planet Uranus is admitted to exert an incalculable influence which may or may not set aside other influences.

It is needless to point out that if the astrological almanacs could predict events, weather, or anything else, with practical accuracy, the public would soon become aware of the fact. But they content themselves with vague generalities, and in the next issue publish a list of "fulfilled predictions" in which they have placed in parallel columns those predictions and those events which have paired off, omitting the others. The same process might easily be repeated with the monthly predictions

## MEMBERSHIP

in the Universal Brotherhood and Theosophical Society may be either "at large" or in a local Branch. Adhesion to the principle of Universal Brotherhood is the only prerequisite to membership. The Organization represents no particular creed; it is entirely unsectarian, and includes professors of all faiths, only exacting from each member that large toleration of the beliefs of others which he desires them to exhibit towards his own.

Applications for membership in a Branch should be addressed to the local Director; for membership "at large" to G. de Purucker, Membership Secretary, International Theosophical Headquarters, Point Loma, California.

interchanged, and with the nativities also.

It is not this sort of astrology that will do anything worthy of attention; nor is it any disparagement of Astrology itself, but surely the contrary, to doubt its imitations. From the little we have access to of Hindû astrology, it can be seen that their science was immeasurably more complicated and profound than our surviving remnant of medieval European astrology. The number of different kinds of divisions of the zodiac is considerable; the fixed zodiac is used, as well as the movable one; and in many other ways there are details that make the science one that only a capacious and well-instructed mind could master. To make astrology of any practical use it would be necessary to enter into it much more deeply than is done today; but with us, it is for the most part left to superficial theory. One could teach an intelligent child the whole technique of casting figures in one or two lessons, and the whole art of judging them in a few more.

Modern astrology cannot compare with phrenology in reliability, and yet phrenology is generally recognized to be but a blind guide, and not worth while. All these "sciences," in so far as they show anything, show a few tendencies. In phrenology it is admitted that the organs change during life in response to the efforts of the owner, who is even advised to change them; and thus the admission is made that the qualities indicated are not masters but servants, amenable to the will, which cannot be delineated. It is the same in our astrology. The horoscope (in the hands of a really skilful modern astrologer) would probably show the tendencies of the nature; but it would not show to what extent the native might surmount or yield to those tendencies.

But in general it is not worth while to spend time on such pursuits as taught today, which at best only tell us things we could more easily ascertain in ordinary ways and which divert our mind from present duty to a speculative future. Parents can learn more

about the character of their children by careful study of them as actual beings than by sending the birth-moment to an astrologer. (We note that the astrologer requires also particulars of the child's birth registration — to prevent himself from being imposed upon by fictitious nativities, so it is stated. It ought not to be possible so to impose

upon him; and one suspects that a little useful information as to the child's station in life would not be found superfluous.)

The ancient science of real Astrology was part of the Mysteries — and it is so still, for clearly what is divulged is not by any means the ancient science. The penalty for pursuing astrology for private ends is that real knowledge takes wings and leaves only its tail feathers in the hands of the would-be captor.

Not the least injurious effect of dabbling in the arts of divination is that it deflects the mind and will from the true practical point of application. The secret of Life consists in doing present duty with one's might and main, whereby one lives in an eternal present and is always "on the spot." But men are ever seeking ways of evading this, and live in their hopes and regrets. It would be nice to see one's way ahead, no doubt; but, even if we could, the knowledge would not bring satisfaction; it would leave us still hungry. Gambling with futurity is like other forms of gambling — an insatiable dissipation. E.

## The Poetry of Astronomy

THE secret beauty and meaning of astronomical happenings is shadowed forth in passages like the following:

"The Persians say that four beautiful stars were placed as guardians at the four corners of the world. Now it so happens that at the commencement of Kali Yuga, three thousand years before our era, the 'Eye of the Bull' and the 'Heart of the Scorpion' were exactly at the equinoctial points, while the 'Heart of the Lion' and the 'Southern Fish' were pretty near the solstitial points. . . . The Hindûs calculated that the moon was at the first point of the zodiac according to her average longitude at midnight on the 17th-18th February 3102 B. C., and that the sun occupied the same place six hours later according to his true longitude; an event which fixes the commencement of the Hindû year." (*Traité de l'Astronomie Indienne et Orientale*, Bailly) F.

## THE THEOSOPHICAL ADDRESS AT ISIS THEATER

LAST Sunday evening at Isis Theater Professor H. T. Edge gave a most interesting and valuable address on "Sacred Knowledge." He began by contrasting the two words, which in our time express two separate ideas, which had been placed in separate departments. These were Religion and Science; religion dealing with the things wholly spiritual, and science with knowledge. In our religion the pursuit of knowledge plays little if any part; indeed, it has actually been regarded as sinful. We find religious men emphasizing their *tolerance* of science, which proves that they do not regard the pursuit of knowledge as being part of their own functions. Because religion has failed to fulfil its duties in this respect, men have had to pitch another camp for the pursuit of knowledge, and so we have our other great institution—Science, which pursues knowledge with but little regard to the question of Sacred Obligations. The study is pro-fane, secular, week-day, mundane.

Continuing, the lecturer referred to the time in the past when Religion and Science were one, but not in the sense of a blend between religion as we have it now and science as we have it now, not an artificial union, for the ancient Wisdom-Religion was one whole of which religion and science are but the remote descendants and the feeble representatives. Both of these have suffered from their isolation.

What other object, he asked, can there be in the pursuit of knowledge except that of the attainment of wisdom in life, the fulfilment of the ideals of the human race? He then took up some of the supposed objects in the pursuit of knowledge. There is the desire to know—often called pursuing knowledge for its own sake. Whither does this eventually lead? He cited Solomon's case as a typical example. It is learning, not wisdom, and is a possession, and like other possessions, may become a burden in the end. The weary scholar gives it all up with a sense of relief, like Solomon or Faust, and seeks the true wisdom of life. Fame and ambition are other objects for which knowledge is pursued. All these motives have their part in the science of today. It is pursued partly for curiosity, partly for ambition and love of fame. There are, however, those who sacrifice themselves for the benefit of others, but too often their labors are afterwards exploited in the interests of private profit.

The speaker then referred to the archaeological discoveries, which are gradually forcing people to recognize that the ancient races must have possessed great knowledge and ability. When H. P. Blavatsky began her mission she declared part of her work to be to demonstrate the reality of ancient science, and her statements and work are being continually corroborated by archaeological discoveries.

There are many signs today that this ancient knowledge is coming back to the world now. People are beginning to see that the soul is the real essential man, and that the reasoning mind, with its doubts and mistakes, is only one of the functions of the soul. The idea of duty and service is coming more and more to

the front. Every day it is being made more emphatic as the watchword of all true progress, whether for the individual or the community.

In short, Theosophy is the one real live thing abroad today, representing, as it does, the thread of spiritual life that runs through all history. It stands as guardian of the watchfires which have been kept alight through all ages. To it men will turn in the hour of need, when they find that other guides have failed them.

OBSERVER

### The Restoration of Chaldea

ARTHUR'S men were out in quest of Mabon the son of Modron, who "at three nights old," as the story says, "was stolen from between his mother and the wall," ages since; and no one had heard of him since the time of his stealing. They went inquiring to the Five Ancients of the World, among whom was the Owl of Cwm Cawlwyd.

Lomaland Photo. and Engraving Dept.

U. S. MARINES MARCHING THROUGH ONE OF THE STREETS OF SYDNEY, AUSTRALIA, DURING THE VISIT OF THE AMERICAN FLEET

"If I knew anything concerning him," she replied, "I would tell you. When first I came here there was a forest in this place. Then came men, and cut down the trees, and built a village where they had grown. And the village grew to be a city with its ships in the East and in the West of the world, and many lines of kings ruled there. And the city grew greater and richer and more corrupt. And in the course of ages hostile armies came, and plague and famine, and the power of the city waned. And at long last the last of the people died, and there was no one to bury him.

"Then the old walls and palaces crumbled and were covered over and trees began to grow, until a great forest was waving its branches here. The oaks grew from the acorns, and dropped acorns in their turn, which in their turn became the fathers of forests. Then men came again, and built another city: if the first city was great and long-lived, much greater was the second, and much longer its life. And now behold, this is the third forest I have seen here."

No doubt the Owl of Cwm Cawlwyd was right, and her story may be taken as a true

guide to the philosophy of history. No doubt no cabin has been erected and grown into a town, but if you digged down deep enough you would come upon the walls and pillars of forgotten habitations. No doubt there is no site in the world but thereon has been a mighty city at some time, and every inch of the world surface has been trodden again and again by multitudes of men; trodden, ploughed, built on, and sailed over. We are an ancient race, we human beings, although the scope of our imaginations will not take in more than a few thousand years of our age-long history.

We know what Chaldaeia was of old. From a few hundred years B.C. back as far as we can see or conjecture, the land between the Euphrates and the Tigris was rich and highly cultivated, a vast system of irrigation making the soil yield immense quantities of grain, the basis, as you may say, of the great Babylonian civilization. Then the glory departed; irrigation ceased, and Chaldaeia became a desert

and a memory. Now, one of the strangest results of the Revolution in Turkey is likely to be the resurrection of its former richness.

The Young Turkish Government, it seems, has retained the services of Sir William Willcocks, whose work in Egypt has made him famous in the Near East, for the purpose of initiating irrigation works on a large scale in certain parts of the Turkish Empire, notably in Mesopotamia. For years, it is said, Sir William has been working out a scheme for restoring the ancient Chaldaean irrigation system, and believes that the former marvelous fertility of the soil may be restored without great difficulty. In a few years Chaldaeia may re-become one of the principal wheat-growing countries in the world. T. Q. G.

THE Greeks liked to see gods and heroes on the stage, those being the kind of persons they would wish to be themselves. So modern managers recognize the millionaire as the fittest character for our dramas.

Let the dramatist, while he is about it, set his millionaires thick upon the boards, for the millionaire is the vision splendid, the sort of man theater goers would choose to be.—*The Nation*

Do we then improve backward? N.

## Art Music Literature and the Drama

### Thomas Paine—Notes by a Student

PAINE was by birth a Quaker and his childhood was spent in the little village of Thetford, England. It is not improbable that as a child he witnessed public executions, and it was through the little village and past Paine's house that the troops marched, dripping with blood, on their way from Culloden and Inverness—massacres achieved "for the glory of God." What wonder that all that was best in the child's nature rebelled against a belief that sanctioned these things. What wonder that years later Thomas Paine should declare: "I moreover believe that any system of religion that has anything in it which shocks the mind of a child, cannot be a true system."

If the years of his childhood were misunderstood, the years of youth and manhood were more so, and at the age of thirty-seven Thomas Paine found himself penniless and unknown. He had fought battle after battle for others, even to the very doors of Parliament. He had been paid in ingratitude; and it was while in despair over the political and moral corruption of the day; that he met Franklin, then in England. Paine was highly educated, and this, with his passionate desire to help his fellows, became the foundation upon which was built the friendship that made these men co-workers, later, as regards America. It was by Franklin's advice that Paine came to America and became editor, in Philadelphia, of the old *Pennsylvania Magazine*; a fact worthy of notice because nearly all of the articles that appeared in the magazine during the eighteen months of Paine's connexion with it were written by Paine himself, and it was in this way that he laid down the lines for many subsequent reforms. It was here that Paine pointed out the disaster that would yet come to the nation from slavery; it was here that he advocated international arbitration; exposed the absurdity and criminality of duelling; suggested a higher ideal of marriage, and a more rational basis for divorce. Paine was the first in America to plead for kindness to animals; the first to demand justice for woman.

And then came the war. Paine was a Quaker, and in laying aside the pen to take up the musket, he invited the bitterest persecution from those of his own sect. He said:

I am thus far a Quaker that I will gladly agree with all the world to lay aside the use of arms and settle matters by negotiation; but unless the whole world wills, the matter ends, and I take up my musket—and thank heaven that He has put it in my power. We live not in a world of angels; the reign of Satan is not ended, neither can we expect to be defended by miracles.

Though Paine distinguished himself for daring, it was not in the battle nor on the march that his real services were rendered. Recall that fearful winter of waiting, when even Washington wrote: "I am almost utterly dis-

couraged"; when the soldiers were half-clad, half-fed, and mutinous; when, as Washington himself confessed, unless something could be done to unify the men and restore their courage, it was useless to go on. What were those words of his which lifted the soldiers above their despairs and filled them with hope?—"These are the times that try men's souls." Paine was writing the first number of the *Crisis*, and its effect upon the disheartened soldiers was magical, read to them and by them as they stood here and there in shivering groups, on the very eve of the Battle of Trenton. The soldiers loved Paine. He shared

Lomeland Photo. and Engraving Dept.

THOMAS PAINE

with them fatigue, hunger, cold, and every privation. He marched in the ranks day after day; fought beside his comrades in battle after battle. It was Paine who brought back into the army the courage, the patriotism, and the patience that had all but departed.

Paine was for years in Paris the virtual representative of the American government, and it was to Paine that Lafayette entrusted, for presentation to Washington, the key of the fallen Bastille. Paine believed that at last his dream might be realized—his dream of an international republic, his dream of the establishment of a universal brotherhood. Then came the flight of the king, the cry of the mob for the king's death. Paine's was the only level head in that convention. Had his proposal been followed—to hold King Louis as a hostage, thus guaranteeing the peace of Europe—there would have been no Reign of Terror.

But it was not to be. In an hour's time

Paine's dream of a "New Order of Ages" again failed of realization. He saw the men whom he had trusted—Marat, Robespierre, Danton and the rest—changed in the twinkling of an eye from philanthropists to blood-thirsty tyrants. It was in this crisis that Paine called Robespierre a hypocrite, which Robespierre never forgave, and at last Paine found himself in prison, on the direct road to the guillotine. It was just at this time that Paine wrote the *Age of Reason*, and of this book he said in a letter to Samuel Adams:

My friends were falling as fast as the guillotine could cut their heads off, and as I expected every day the same fate I resolved to begin my work. I appeared to myself to be on my deathbed, for death was on every side of me, and I had no time to lose. . . . The people of France were running headlong into Atheism, and I had the work translated in their own language to stop them in that career and fix them to the first article of every man's creed, who has any creed at all—"I believe in God."

More inspiring and more pathetic than all that had gone before was Paine's final effort to help humanity. In a little room in Paris, rising once more and for the last time in godlike strength above the ruin of his hopes for France, he formed, with five families, the *Theophilanthropical Society*, (note the name), the avowed object of which was to establish a nucleus of a *Universal Brotherhood*.

The meetings consisted of readings from ancient sacred writings, Chinese, Hindû, Greek, etc., and a white altar, with flowers laid loosely upon it, stood in the center of the room. The members stated clearly and simply their belief in God and in man's Divinity and echoed Paine's declaration that "true religion has two principal enemies, fanaticism, and infidelity."

Dream after dream had failed of realization. This, too, was to vanish, Paine's last hope of establishing a Universal Brotherhood. The Church

had its eye upon Paine, and five years later, when Pope Pius VII concluded the Concordat with Napoleon, the work of the *Theophilanthrophists* was the first to be sacrificed.

To students of Theosophy the account of the establishment by Thomas Paine of a society whose principal objects were similar to those of the society founded by Helena Petrovna Blavatsky and William Q. Judge not far from a century later, is significant, for it furnishes one with the key to a right understanding of Paine's whole life. It is the only key that will unlock to us the heart of his motives throughout the long, long record of selfless, heroic, and always wise and well-timed acts. That Thomas Paine was wiser than his generation there can be no doubt, and that he was possibly an agent of those Great Helpers of Humanity who work behind the scenes for man's redemption there is also evidence. It must be left to the future to interpret his life rightly. The present is not ready. H.

There is joy everywhere, all hearts are glad, every face is happy.

—From an Egyptian Hymn to Osiris, 1500 B. C.

IT is difficult to realize how constantly, how incessantly, these are being planted in every human heart. All men are creators. All create these seeds, and moment by moment drop them into their own mental matrix, careless as to the momentous results which each one brings. No tropical clime can compare with the fertility of this soil. However rich or luxuriant such growth might be, it can but give a hint of it; *for here no seed is ever lost*. It may lie dormant for centuries, but with terrible inevitableness, when the proper conditions are furnished it sprouts and grows. It may be that in lives hence it will become strong and rank and poison the air that is breathed. No wonder that all the great Teachers have said the same thing, they who with their clear vision can look into the past and future, and who know what it means *to make the heart clean*.

How many lives of disappointment, how many searching experiences are needed, to bring even a faint sense of the responsibility of thought! Every crime began as a thought seed — simply a seed, which seemed too small at the time to be worth notice. Every characteristic, every ruling tendency, every hardened habit, every clog to thought, inhibiting the power of the Soul with all its transcendent possibilities, was once but a tiny thought seed, thrown carelessly or wilfully into the depths of a human heart. What would one think of a gardener who planted indiscriminately together seeds which would bring forth the most exquisite and fragrant flowers, and others certain to grow into powerful and poisonous trees whose leaves would exhale noxious vapors and whose thirst for life would devour all the lovelier, tender growths? Certainly one would say that he was mad. And yet this cannot be compared with the madness of human beings, who plant, reap, and suffer — plant, reap, and suffer — for ages, before they awaken and direct their thoughts.

Anyone, by looking carefully into his mem-

## Thought Seeds

ory book, can find there experiences, which if analysed closely, will reveal the seeds which brought them about. Their nature was evident to him from the first, but they seemed too small to worry about, and he spent his efforts, if he spent them at all, on something larger, or something more evident to an inexperienced soul.

By degrees a seemingly innocent seed began

**DO** unto another what you would have him do unto you. Thou needest this law alone. It is the foundation of all the rest. — *Confucius* 500 B. C.

**WE** should conduct ourselves towards others as we would have them act towards us. — *Aristotle* 385 B. C.

**AVOID** doing what you would blame others for doing. — *Thales* 464 B. C.

**WHAT** you wish your neighbors to be to you, such be to them. — *Sextus* 406 B. C.

**NEVER** will I seek or receive private individual salvation; never will I enter into final bliss alone; but forever and everywhere will I live and strive for the universal redemption of every creature throughout the world. — *Kwan-Yin*, China.

**IT** is not permitted to return evil for evil. — *Socrates*.

to sprout, and the mind or the man grew used to it. For some strange reason, he had a certain fondness for it at first, simply because it was planted in his own soil, for had he seen it elsewhere he might have had the nerve to root it out at once. Then, as it grew and grew, he became more used to it. The emanations it threw off dulled his senses just enough to make him fail to realize into what the plant was growing. And then it grew strong, and became woven into his character. Perhaps a crisis came, which he had to meet, but found this plant to be in the way. Then he learned,

in trying to kill it, what he had harbored.

The subtlety of the danger seems to lie in the fact that as soon as a seed has taken root, one becomes so used to it as to be unconscious of its power. The vision is clearer at the moment of planting. And if only the determination can be reached not to temporize with the smallest evil, not to look leniently upon even the seeming trifles, one might begin to make his heart clean with hope of success.

The old plants which are not offshoots of the eternal Tree of Life will die of themselves in time, and if not watered, will die quickly. They have their life span, they are not immortal, and if through the awakened will the seeds are guarded, the work of purification can proceed. Of course, many surprises must be in store for every one, for who can say what dormant seeds there may be, seeds planted in the far distant past?

With this in view, a searching care seems the wisest course. It is better to do some unnecessary work than not to do enough. It is better to strike out all questionable seeds, if such appear; to sacrifice some which in certain aspects seem desirable, rather than to run any risk. For surely all have enough to do — *and there is no time to waste*. H. H.

IN the fundamental laws of the spiritual world, which are immutable, no exception is possible. But there are rules for those who see, and rules for those who prefer to remain blind. . . . The Ego is the actor, and its numerous and various incarnations the parts it plays. Shall you call these parts with their costumes the individuality of the actor himself? Like that actor, the Ego is forced to play during the Cycle of Necessity, up to the very threshold of *Para-nirvâna*, many parts such as may be unpleasant to it. But as the bee collects its honey from every flower, leaving the rest as food for the earthly worms, so does our spiritual individuality, whether we call it Sutrâtma or Ego. — *H. P. Blavatsky*

### Elizabeth of England

THE duty of an historian now requires me, in justice to the memory of Elizabeth, to declare frankly that since the publication of her biography in the preceding editions of *Lives of the Queens of England*, my opinion of her conduct in regard to the death of Mary, Queen of Scots, has been materially altered by the discovery of a contemporary document in the Cottonian library.

In thus nobly acknowledging her error, Agnes Strickland, the historian, set an example that not all are as yet ready to follow. It is, however, now acknowledged by authorities, that the signature of Queen Elizabeth to the death warrant of Mary, Queen of Scots, which warrant "none of her council could ever induce her to sign," was forged by one Harrison who was Walsingham's secretary—and this with the knowledge of four of Elizabeth's own ministers. The document in question consists of a number of depositions.

Far from having been cruel, there are many proofs that Elizabeth was magnanimity itself, often at the risk of her own safety. At a time when Katherine Ashley and her husband were imprisoned in the Tower on account of some intrigue, she wrote to Somerset:

I am the bolder to speak for another thing, which is Katherine Ashley, that it would please your grace and the rest of the council to be good unto her. Which thing I do . . . because she hath been with me a long time and many years, and hath taken great labour and pains in bringing me up in learning and honesty, and therefore I ought of very duty speak for her. . . . Also if I may be so bold, not offending, I beseech your grace and the rest of the council to be good to Master Ashley, her husband, which, because he is my kinsman, I would be glad he should do well.

Your assured friend to my little power. ELIZABETH

Elizabeth, motherless (and worse, for Anne Boleyn had suffered an ignominious death upon the scaffold), had not, after the death of her good step-mother when she was fifteen, a single disinterested friend, and it is not strange that the lonely, affectionate girl should have given unreserved love and confidence to her governess, little worthy as the latter may have been in some respects.

The two years' retirement forced by intrigue and shameful motives upon Elizabeth when she was sixteen was by no means wasted in melancholy nor in seeking for distraction. The years spent in the companionship of the

tactful and accomplished Queen, Katherine Parr, Henry VIII's sixth and certainly wisest wife, bore fruit in a love of learning which the girl Elizabeth now gratified. Under Roger Ascham she studied Latin and Greek, and he wrote of her:

Latin she speaks with propriety and judgment; Greek only with me, and moderately well. Nothing can be more elegant than her writing and in music she is very skilful.

French and Italian she also spoke with charm and correctness and her deeply religious nature joined with her love of literature to give her a wide acquaintance with the

her household and court and no Queen ever had more devoted service from those who had loyal motives. La Motte Fénelon, in a letter addressed to Catherine de Medicis and written while he was the French ambassador at Elizabeth's court, wrote:

They write and speak very differently of this Princess from the hearsay of men who sometimes cannot forgive the great qualities of their betters; but in her own court they would see everything in good order, and she is there very greatly honored, and understands her affairs so well that the mightiest in her realm and all ranks of her subjects fear and revere her, and she rules them with authority, which I conceive could scarcely proceed from a person of evil frame and where there was a want of virtue.

This was written at a time when enemies had spread all over Europe infamous and malicious reports about the Queen. Lord Bacon (in whom Elizabeth did not place unbounded confidence, it is said) wrote that she was

a good and moral Queen, hating vice and studying to preserve an honorable fame. . . . Both nature and fortune conspired to render Queen Elizabeth the ambition of her sex and an ornament to crowned heads. This Princess lived in a learned and polite age, when it was impossible to be eminent without great parts and a singular habit of virtue.

Elizabeth kept her people out of war during her long reign under circumstances that often would seem to make peace an idle dream only, and of this Bacon wrote, later:

And this peaceful reign did not proceed from any disposition of the times, but from her own prudent and discreet conduct. This peaceable disposition of hers, joined with success, I reckon one of her chiefest praises, as being happy for her people, becoming her sex, and a satisfaction to her conscience. . . . to speak the truth, the only proper encomiast of this lady is Time.

STUDENT

### A Link Between Present and Past

IN New York City lives an old lady who remembers General Lafayette. She is now in her ninety-sixth year, and, as is the way with so many who have passed the seventy-year milestone on life's journey, loves the quiet hour with reminiscences. She said recently to a friend who was calling upon her:

I remember well the second visit General Lafayette paid to this country, and the enthusiastic reception given to him at Uniontown when he was on his way over the mountains from Washington. I had the pleasure and honor of being one of the girls selected to scatter flowers along his pathway. H.

### TAUENZHENSTRASSE, BERLIN

THE illustration shows one of the beautiful thoroughfares of Berlin, a city so clean and well-ordered that it would seem to be under the personal supervision of one of her own famed *Hausfrauen*. The well-paved sidewalks, driveways, and promenades, are as well scrubbed as her garden paths, and as free from papers and refuse; while the city parks and grass plots are as trim, as crisp, fresh and sweet-smelling, as her fragrant garden beds.

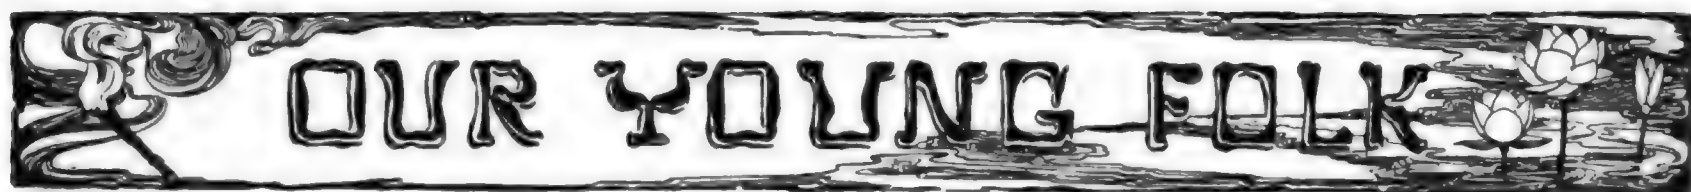

It was a familiar sight to the Berliners of hardly twenty-five years ago to see the stately and erect, though aged Kaiser, his esteemed consort by his side, saunter through these broad avenues. The Kaiser Wilhelm Memorial Church is not needed to keep their beloved old Emperor in the memory of the present generation of Germans. By his simple, true, warm-hearted goodness, he won their faithful allegiance, and his memory is enshrined in loving hearts even more royally than in the building reared to do him honor.

A GERMAN STUDENT IN LOMALAND

Greek and Latin poets and the writings of the early Church Fathers. In an old black letter copy of the Pauline Epistles, yet existing, the cover of which was richly embroidered by Elizabeth during her virtual imprisonment at Woodstock, we may read on the fly-leaf in her own writing the following:

August—I walked many times into the pleasant fields of the holy Scriptures, where I pluck up the goodly herbs of sentences by pruning, eat them by reading, chew them by musing, and lay them up at length in the high seat of memorie by gathering them together; that so, having tasted their sweetness, I may the less perceive the bitterness of this miserable life.

All her life the Queen loved pets, especially, says one historian, "little dogs and singing birds"; and her love for children was often her greatest solace at disheartening and dangerous times—for she passed through many. She was goodness itself to the members of

# OUR YOUNG FOLK

## The Geography of a Lomaland Garden

**I**N a Lomaland garden was a tiny cave; in the cave many little stones; beneath the stones was a tiny dwelling in which lived Nisse Frog with his family. The garden was not too large for Jack Rabbit to be able to get from one end of it to the other in ten jumps, but to Nisse Frog it seemed as big as a country. One day he said to his friend Tagge Horntoad, who lived on top of the cave in the warm sand: "It is time for something to be done about the education of our children. I have decided to go out and explore the country around here, make maps, and study the life of its inhabitants. Will you go with me?"

"I am ready to start now," said Tagge, and off they went. First of all they defined the boundaries. They found that it was bounded on the west by an immense wall called a cypress hedge. "This must certainly be even higher than the great wall of China," exclaimed Tagge, "no frog could ever venture to measure its height."

On the north they found their country bounded by Casa Rosa, a great palace, about which all the children in the garden whispered marvelous things though no one as yet knew anything for sure. Only the flowers who had grown to the greatest beauty and perfection might ever enter there, and, alas, they never came back to tell what they had seen. Still it was the aspiration of every plant to be able to have some blossoms worthy to go there.

On the east the country was bounded by a great road leading to the end of the world.

So far all had gone well for Nisse and Tagge, but when they were going to trace the southern boundary there was none to be found.

"Where is the southern boundary," wondered Nisse, greatly puzzled. "We must find it or how can the children learn it? Run, Tagge; run, and try to find out while I stay here and watch." But Tagge shook his horns and did not want to go. "If I leave you," he said, "you might be taken away just as the boundaries have been, and I should never find you. Let us ask the bird just flying this way."

"Sir Swiftwing!" they both called, "come this way, please. We have lost the southern boundary line of this country, and we cannot find it. Can you see it anywhere, sir?"

"The garden is three-cornered," called Sir Swiftwing in answer, without stopping. Nisse and Tagge looked at each other, as puzzled as before. "Well, let us not mention anything about the boundaries on the south," they concluded. "Then we shall not deceive any one and those who are interested may find out for themselves." With this decision they proceeded to find out about the interior of the country and its inhabitants.

Soon they came to a baby tree. "What is your name, little one?" asked Nisse Frog.

"Tamarisk," answered the Tree.

"What are you going to be when you grow up?" asked Nisse.

"A small tree," said Tamarisk. "I am

going to dress in feathery green, my branches will be soft and flexible; I shall spread out my arms this way and that way, and wave my green twigs as garlands in a graceful dance. Oh, when my flowers come in dainty sprays of pink, how beautiful I shall make the garden! I have inherited the secret of how to draw water from the air, and I am practising even now. When I am big I will let little flowers grow all around me, and then when the weather is dry and they are thirsty I will secretly draw every leaf full of water during the night, and when the sun looks at me the little flowers will also look up and think that my dress is sprinkled with diamonds. As they are wondering, another surprise will come; suddenly I will shake my arms and down the water will rain, and they will drink — Ha! ha! ha!" Little Tamarisk laughed so joyously that three of her leaf-buds burst open at the top.

Nisse and Tagge went a little farther and met another tree, not even as big as Tamarisk. "What is your name?" asked Nisse.

"Locust," answered the Tree.

"What are you going to be when you grow up?" asked Nisse.

"A tree," said Locust. "Tamarisk and I are planning to make a beautiful bower. We will join hands; I shall have big clusters of white flowers hanging down from my branches and they will entwine among Tamarisk's pink ones;" — Locust became lost in beautiful imaginings and did not say anything more.

"What is your name, child?" asked Nisse of the next little tree.

"Juniper," answered he.

"What are you going to be when you grow up?" asked Nisse.

"A doctor," said Juniper.

"In what line, please?"

"Come again when I have my berries done," murmured Juniper, and that was all he said.

"His needles are as sharp as your horns, Tagge," said Nisse; "but he will become something very useful, judging by the busy way in which he works."

They met young Incense Cedar, Cherry, Silk Oak, Willow, Peppertree, and Acacia, who each had a dream of usefulness or beauty for the time when they should be grown up, and were busy working to make it come true. They also met quaint-looking little Casvarina, who said that her ancestors came from old Lemuria.

"How great our land is!" exclaimed Nisse in ecstasy. "Here are inhabitants from all the world, and they are all friends; they are all working to make the country beautiful. Let us hasten, Tagge, that we also may do great things." With this Nisse took a leap right over the top of a tiny plant.

"I think that you overlooked someone," said Tagge.

"Do you mean that little thing with only three leaves? Dear Tagge! We have not time for every little weed that grows," answered Nisse and was going farther, but

thought that he heard a voice near by. Sure enough! and it was singing:

"Big Oaks from little acorns grow."  
Learn and know! Learn and know!

Nisse heard that it came from the little one with three leaves. "Who are you?" he asked with trembling voice.

"Oak," was the answer.

"An Oak Tree!" gasped Nisse and Tagge in amazement. "O, pardon, pardon! And will you not grant us the honor of hearing your plans for the future?"

Little Oak nodded his leaves pleasantly. "Much was written within my acorn that only my dryad may read, in silence. Many little golden threads were there seen, which were fastened to the world of man. Do you see those Râja Yoga babies playing near by? We shall grow together. When my first acorns are clustering on my small branches, they will share my joy. I shall see them as men and women go out in the big world to fight battles against wrong and evil and when they return my leaves will adorn the victorious heroes. I shall hear them relate their experiences to one another; my dryad will rejoice and record everything on my year-rings. When their children's grandchildren are old, I shall still be young and strong. They will be my friends as their forefathers have been; my dryad will record what we have seen of their life, year-ring upon year-ring. Their grandchildren's great-grandchildren will play in my shade with the acorns, and I shall tell them stories of all that I have seen and heard; they will read what my dryad has written. My strong branches will reach from one side of this garden to the other."

The Oak was silent. Nisse and Tagge crept away trembling with awe, as if the shadow of its great branches were already falling on them, and the majesty of a hundred-year-oak looking down on their small bodies. But the little Oak with its three leaves built silently for its mighty future.

"Come Tagge, said Nisse, "let us rest, and think over all we have heard and seen. I never thought that our country was so full of wonders."

Some time later they again went out to explore. They had not gone far before they met a little tree.

"What is your name?" asked Nisse.

"Eucalyptus," answered the little Tree.

"What are you going to be when you grow up?"

"Ask Prince Blue Gum, my cousin. He knows all about our family. My private plans I am not permitted to tell," said Eucalyptus.

Nisse and Tagge wandered hither and thither seeking for Prince Blue Gum, and at last they met a wise-looking Elder-berry Bush whom they asked for information.

"You are standing right beside him," said he. "Go a little farther off, and you can see and speak with him."

Nisse and Tagge now felt the cool shade; they looked up, but saw nothing but a great

# THE CHILDREN'S HOUR

trunk and masses of blue-green leaves, every leaf humming as it grew.

"How pleasantly refreshing," said Nisse, "let us stay a while."

"But, you remember, we are working for the education of the children," said Tagge.

They went a distance off and saw a tree as high as a house. To be mathematically correct Nisse went back and measured the trunk. It was 18 frogfeet in circumference. After having paid profound respect to Prince Blue Gum, Nisse asked for information about the Eucalyptus family.

"There are many of my relatives of that name represented here in this garden. That one near by, as tall as a man and already covered with creamwhite flowers, is Grape-clustered Eucalyptus; the one with shining leaves is Lemon-scented Eucalyptus, who is very neat and puts his leaves and flowers high at the top where they will not get dusty or spoiled; up there they are all fresh for the bees. That one with the small leaves on slender, graceful twigs is Red Iron Bark; the one just now whispering with him is Manna Gum, with leaves full of sugar. There are Sugar Gum, Red Box, Beautiful Leaved Eucalyptus, and Red Blossoming Eucalyptus, which some great man has said is the most beautiful flowering tree in the world. Each of us has special things to do, but as a family we are all skilled in chemistry. Many are the wonderful oils and health-giving medicines that we know how to extract from the air and earth, and the bees draw perfumed honey which has a healing power, from our blossoms. We have arranged it among ourselves so that the bees will have flowers for honey all the year round. We are also working to make the atmosphere balsamic and the temperature healthy and pleasant."

"How much he knows," whispered Tagge. "He must be very old, perhaps fifty years."

"A hundred years, at least, Tagge. Do you not see that he is the biggest tree in the garden? But so as to be precise in our statements, I shall ask him," said Nisse.

"I shall be three years old on my next birthday," answered Blue Gum.

Nisse and Tagge were so astonished that they did not say a word, and Blue Gum went on: "The children of our family, living here in this garden, are playing at having a race. We started at the same time and, as you see, I am at least four times as big as any of the others. I mean to be almost fifty feet tall for my fifth birthday. Some people say that I am the fastest growing tree in the world. Some of the others will catch up with me

later on, though; they would have grown more, if they had had more shade. Now I can help them. You see, I do not depend so much on these things, because I have learned how to help myself under all circumstances. I put up my own shade.

"You wonder why my top half is shining green with long narrow leaves, while my lower half is light blue-green with leaves of a different shape. These lower ones are my sunshades. I made them, as you see, like little parasols, one on top of the other, and filled them with extracts from my secret laboratory, so that the sun cannot dry them out. They

my only sorrow in life. Anything else I will gladly tell you."

"What are you doing?" asked Nisse.

"Just having a race with Blue Gum, and I have grown nearly as fast as he; I am trying to make the garden look beautiful until the other trees are grown up; I try to shade them as best I can."

Nisse and Tagge went on, wondering who he might be. "Let us ask Elderberry Bush," said Tagge.

"Well," said Elderberry, "his name is Tobacco Tree. But it is unjust, most unjust! Even if he is a distant relative of that plant it seems to me that he has done enough to deserve a name suited to his own qualities. Just think! In the dry summer when not a green blade is to be seen on some of the wild hillsides, there he stands cheerfully with fresh blue-green leaves and his pretty yellow flowers, and I do not think that even Prince Blue Gum himself stands above him in the art of finding water. The humming-birds are always to be seen about him, fluttering among his flowers, which seem to be made especially to fit their long bills. On the bottom of each flower he has put a drop of honey, and he keeps blossoms for them all the year. Who else could do that? We, his comrades in this garden, have decided to call him Humming-bird Tree, until a messenger can be sent to the Râja Yoga children to plead his cause. They will certainly understand what is right, and help us."

"Probably this also will become a tree," said Nisse as he pointed to a little thing not more than one baby-foot tall.

"You see, Tagge, we learned

that the smallest thing may hide great possibilities. Now let us go home and teach the children what we have found out about our country. At least the most important inhabitants are counted. Come, Tagge!"

"Were you not going to ask the little plant's name?" said Tagge.

"I might just as well," said Nisse. "Who are you?"

"Big Tree of California," was the answer.

If a thunderbolt had struck them they could not have been more surprised. Then, "In a thousand years—in a thousand years"—sang the dryad of the baby giant, and a wonderful joyous music filled the air for a moment.

Nisse and Tagge did not hear; they were already far away. Their heads were over-full with all that they had seen and heard, and it will be some time before they are ready to go on their next journey of exploration. YLVA

RAJA YOGA TOTS IN THE GARDEN EXPLORED BY NISSE FROG AND TAGGE HORNTOAD

give shade to me until I have grown big and strong-rooted enough to put on my grown-up leaves.

"Most of us like to live where we can hear the roar of the ocean. My own brothers and myself, living here in Lomaland, are very busy, because we are dreaming of building a great ship to carry the Râja Yoga children with a cargo of brotherhood out to those living over the sea. Our wood must be strong and firm."

Filled with wonder, Nisse and Tagge wandered silently away. Looking up, they saw a slender graceful tree with clusters of yellow flowers; but the top of it was bent, as if undecided whether it had really the right to be called a tree.

"What is your name?" asked Nisse. No answer. Nisse asked again, and then a timid voice pleaded:

"Do not ask me for my name, please; it is

# THE MYSTERIES OF THE HEART DOCTRINE

Prepared by  
**KATHERINE TINGLEY**  
AND HER PUPILS

*The Theosophical  
book of the  
Twentieth century*

Tells the story and the history of the Theosophical Movement.

The prices are \$2 in cloth and \$1.25 in paper, which barely cover the cost, for it is printed and bound, not gaudily, but with such carefulness and thoroughness of art and craft as to make it unique among modern edition books.

**THE THEOSOPHICAL PUBLISHING COMPANY**  
POINT LOMA, CAL.

**Isis Conservatory of Music  
OF THE UNIVERSAL BROTHERHOOD  
AND THEOSOPHICAL SOCIETY**  
POINT LOMA, CALIFORNIA

Personal applications and inquiries received every Saturday  
by the Secretary at SAN DIEGO BRANCH

**ISIS HALL, 1120 FIFTH STREET**

between the hours of 9 A. M. and 4 P. M. Full particulars will be sent by mail upon application to

**J. H. FUSSELL, Secretary and Treasurer,**  
*Isis Conservatory of Music,*  
Point Loma, California.

**SOME OF THE ERRORS OF CHRISTIAN  
SCIENCE  
CRITICISM**

by H. P. Blavatsky and William Q. Judge

CONTENTS:

"The Empty Vessel Makes the Greatest Sound"  
A Note of Warning

—by H. P. Blavatsky

Of "Metaphysical Healing"

Affirmations and Denials

The Cure of Diseases

Replanting Diseases for Future Use

—by William Q. Judge

A MOST VALUABLE PAMPHLET. Outside of Theosophy there is given no adequate explanation of the healing that is at times accomplished, nor of its rationale, nor of the ultimate price that must be paid and the dangers connected with such practices.

This pamphlet is invaluable to all students.

Price - 15 cents
